# MECHANICAL ENGINEERING

INCLUDING THE ENGINEERING INDEX

## Professional Fellowship

The American Society of Mechanical Engineers furnishes many opportunities for professional fellowship, the most important of which is the Annual Meeting in New York, taking place this year December 1 to 4. During the same week the Third National Exposition of Power and Mechanical Engineering will be held in the Grand Central Palace. The strong meeting program and the diversity and interest of the Exposition make an effective combination for the promotion of professional fellowship.

# New York will never go dry

THE water supply system for Greater New York was designed with the thoughts of reserve supply and safety foremost. Up in the Catskills, near the source of this water supply, is the Ashokan reservoir. This is ample for New York in the far distant future. A few miles away is the Kensico reservoir, built for safety. On the outskirts of the city there is a third reservoir, and on Staten Island a fourth.

Linde's national system of 115 plants and warehouses is like the New York water system. The reserve facilities of any or all of these plants and warehouses can be directed toward the single plant or warehouse that is your source for oxygen.

## THE LINDE AIR PRODUCTS COMPANY

General Offices: Carbide & Carbon Bldg.  
30 East 42d Street, New York

38 PLANTS—77 WAREHOUSES

### Step by Step

The Linde Company has recently issued two new books: "*Step by Step in Gas Welding a Crank Case*" and "*Step by Step in Gas Welding a Cylinder Block*." Like all Linde books, they are written from practical experience and to fill a definite need.

One welder says that these books will enable him "to perform welding operations he was previously refusing." Another says they contain "information of high value," and a third adds, "... something I have been looking for."

Many welders have fallen just short of success on the operations described, step by step, by word and by picture, in these two books. That is why Linde has written and published them.

All Linde books are issued as a part of Linde Service. Ask the nearest Linde District Sales Office to tell you about all the Linde books.

## Contributors to this Issue

**Sumner B. Ely and Walter F. Rittman**, co-authors of the leading article in this issue, are connected with the Carnegie Institute of Technology. Mr. Ely received his M.E. from the Massachusetts Institute of Technology in 1892. He has been associated with the Pressed Steel Car Co., the American Sheet Steel Co., and the American Sheet and Tin Plate Co. In 1905, he organized the Chester B. Albee Iron Works Co., of which he became vice-president. In 1916 he became assistant professor of commercial engineering at Carnegie.

Dr. Rittman received his A.B. from Swarthmore in 1908 and his Ph.D. from Columbia. He entered the business world as chemist for the United Gas Improvement Co. of Philadelphia. For seven years, from 1914 on, he was chemical engineer with the U.S. Bureau of Mines. He became head of the Department of Commercial Engineering at Carnegie in 1921.

**William F. Durand** who writes on Simpson's Rules Generalized, was graduated in 1880 from the United States Naval Academy. He served for seven years in the Navy and then entered the teaching profession, first at Michigan State Agricultural College and then at Cornell University. From 1904 to June of this year he has been professor of mechanical engineering at Stanford University. A complete account of Doctor Durand's career was presented in the *A.S.M.E. News* for June 22, 1924.

**Ralph E. Flanders**, director and manager of the Jones & Lamson Machine Tool Co., Springfield, Vt., writes on the Design,

Manufacture and Production Control of a Standard Machine. Mr. Flanders became designer for the International Paper Box Machinery Co., Nashua, N. H., in 1901. From 1905 to 1910 he was associate editor of *Machinery*, and then became connected with the Fellows Gear Shaper Co. He has been with the Jones & Lamson Co. since 1912.

**C. M. Johnson**, who writes on The Manufacture of Gasoline, was educated in the public schools of California and is a graduate in the class of 1906 of the California School of Mechanical Arts. When the Cities Service Co. formed the Empire Companies with headquarters in Oklahoma, Mr. Johnson was employed as designing engineer. In July, 1923, he accepted the position of chief engineer of the Invincible Oil Co. of Shreveport, La. He is now with the Pierce Petroleum Corporation as designing engineer.

**L. A. Quayle**, author of The Fairmount Pumping Station and Heating Plant, was graduated from the Case School of Applied Science in 1909. He served the apprenticeship course for college men with the Westinghouse Machine Co., and then became assistant chief engineer of the Foos Gas Engine Co. Since 1912 Mr. Quayle has been with the Cleveland Water Department, of which he is now chief mechanical engineer.

**J. D. Pedersen**, who writes in this issue on The Design of Ordnance Matériel is associated with the War Department for the solution of certain ordnance problems. He

is the inventor of a repeating firearm whose manufacture was undertaken in 1903 by the Remington Arms Co. The association then established with that company has been maintained for 20 years, during which time Mr. Pedersen has invented and designed a number of firearms; also consulting on the methods and equipment for these and carrying them through to routine production.

**Hasbrouck Haynes**, author of The "Manit" System for Measuring and Stimulating Labor Effort, is president of the Haynes Corporation, engineers, in Chicago. Mr. Haynes was graduated from Stevens Institute of Technology in 1910 with the degree of M.E. During his career he has been associated with James Newton Gunn at South Bend, Ind., and Detroit, Mich., the Studebaker Corporation of Canada, Ltd., and the Packard Motor Car Co.

**Max Thornburg and Frank L. Maker**, co-authors of Economic Features of Heat-Exchanger Design, are both connected with the El Segundo Refinery of the Standard Oil Co. of California, as assistant chief engineer of the manufacturing department and as designs engineer, respectively. Mr. Thornburg was graduated from the University of California in 1917, later taking graduate work at the University of Grenoble, France. He served three years as captain in the 46th Artillery of the A. E. F.

Mr. Maker was graduated from the University of California in 1916. He spent two years, 1917 to 1919, as an engineer officer in the Army.

## Industrial Power of the Pittsburgh District outside That of the Iron and Steel Industry

By SUMNER B. ELY<sup>1</sup> AND W. F. RITTMAN,<sup>1</sup> PITTSBURGH, PA.

THE Carnegie Institute of Technology, through its Commercial Engineering Department, is conducting a major investigation of present power requirements and future power possibilities in the Pittsburgh District (1) with relation to the community and its development as a whole, and (2) with relation to the various specific industries of the community.

In the first communication in connection with this inventory (MECHANICAL ENGINEERING, July, 1923) the authors presented data covering variations in costs and amounts of fuel used over a ten-year period, the relation between boiler capacity and the steam produced therefrom, and other pertinent data having to do with power in the production of iron and steel in the Pittsburgh district. The rather startling fact was developed that the iron and steel industry of the Pittsburgh district uses more than four billion boiler-horsepower-hours. To better emphasize this volume, it was brought out that if the boiler-horsepower-hours as shown in the Pittsburgh power-study curve for the year 1920 are put into equivalent kilowatt-hours, it will be found that this figure is about two-thirds of the total industrial kilowatt-hours for the same period as given in the Superpower Survey for the region between Boston and Washington lately published by W. S. Murray and others.

In the second communication (*Electrical World*, June 21, 1924) the authors presented data pertaining to central-station power of the Pittsburgh district. Overall capacity and volume-output figures were detailed, as well as analyses showing variations in output over the different hours of the day, over the different days of the week, and over different months of the year. Peak loads over the ten years under observation were plotted, and projections of requirements into the near future were attempted. One of the high lights of this phase of the authors' study was the finding that due to a combination of reasons, such as the substitution of large-capacity central-station units for miscellaneous isolated units and of the turbine for other prime movers, the amount of power derived at the

bus bar from a ton of coal is today two hundred and fifty per cent of what it was in the Pittsburgh District a short ten years ago. Despite the importance of central-station power to the Pittsburgh district, it was found that the power output of the iron and steel industry for the district is approximately four times the output of central power stations in the same district.

The purpose of the present communication is, first, to present facts and data relating to total industrial power of the Pittsburgh district; second, to indicate changes and trends in industrial power of the district and their influence on industry of the district; and third, to show the relationship existing between power and population and the tendency to develop further and further from congested centers.

The method of procedure followed in developing this survey or inventory of power in the Pittsburgh district has been described in the prior communications referred to. While the authors made use of information compiled by the Federal Census Bureau, the Pennsylvania Department of Internal Affairs, the American Iron and Steel Institute, and various technical and industrial publications, nearly all of the information was derived from primary sources and in all cases reviewed by engineers whose experience and judgment added value to the findings. Because of the importance of Pittsburgh as a power center

and because of the number of engineers and economists in the district interested in power, the authors were fortunate in being able to associate with themselves in this effort an information or "steering" committee which consisted of leaders in the field. The effort was further greatly helped by the willingness of representatives of different institutions in the district to sit about a common table in an effort to find common denominators for the various ways of keeping records and accounting in the district.

As was brought out in the previous article, corporate Pittsburgh, because of its greatly restricted territory, does not represent industrial Pittsburgh. A glance at the various charts referred to later will show that the population and power in the district outside of Allegheny County are at least 50 per cent of that within the county, and that the corporate city of Pittsburgh represents

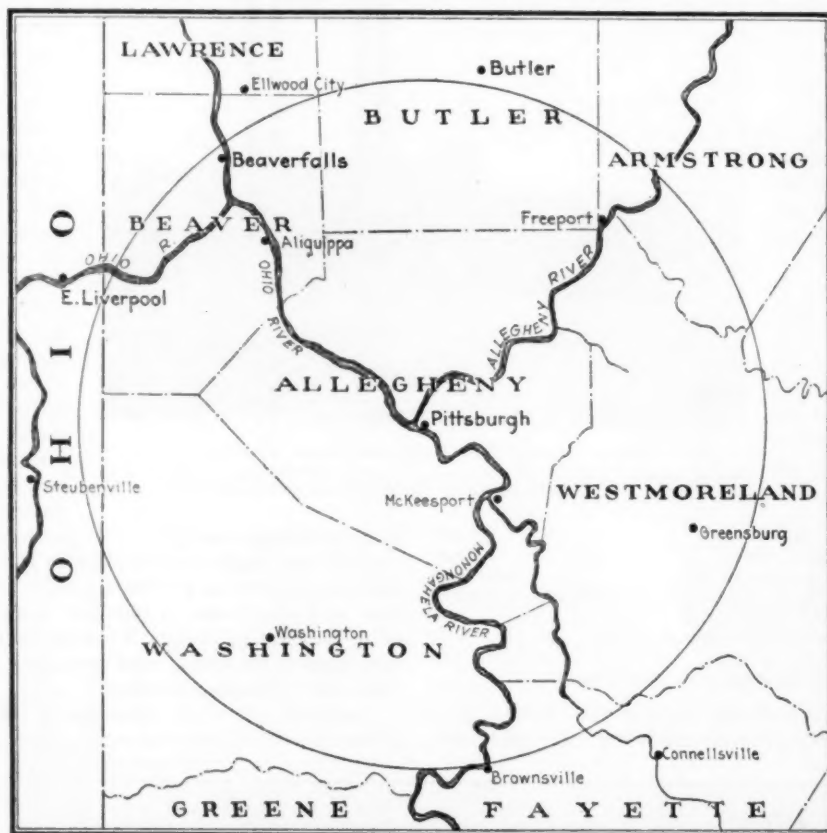

FIG. 1 THE PITTSBURGH DISTRICT STUDIED, WHICH EMBRACES THE AREA WITHIN A RADIUS OF THIRTY MILES FROM THE CITY'S CENTER

<sup>1</sup> Professors of Commercial Engineering, Carnegie Institute of Technology. Consulting Engineers for the Giant Power Survey of the State of Pennsylvania.

GENERAL VIEW OF PITTSBURGH

only a part of Allegheny County. The corporate limits of the city have never been expanded in any wise commensurate with the growth of its industries nor comparable with the expansions of the corporate limits of other metropolitan districts. The area selected for this study was that of the circle struck with a radius of thirty miles from the Pittsburgh City-County Building as the center (see Fig. 1), because the people and industrial plants comprised within it are intimately associated with and largely dependent upon the facilities of corporate Pittsburgh. Practically all the industries covered by this area, as well as a considerable portion in addition, clear through corporate Pittsburgh both physically and financially. This can best be illustrated by the fact that bank clearings in Pittsburgh amount to approximately \$30,000,000 daily. The following data in regard to areas of Pennsylvania and of the Pittsburgh district, installed horsepower, etc., are also of interest:

Area of state of Pennsylvania, square miles.....	45,126
Area of Pittsburgh district, square miles.....	2,827
Installed industrial horsepower in state in 1922.....	4,633,594
Installed industrial horsepower in Pittsburgh district in 1922.....	1,518,342
Percentage of state's area in Pittsburgh district.....	6.3
Percentage of state's installed power in Pittsburgh district.....	33.0

#### CHANGES IN INDUSTRIAL PITTSBURGH

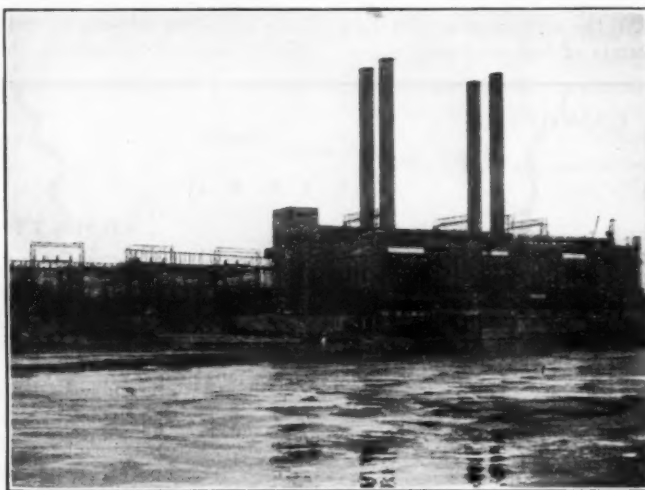

Pittsburgh is known throughout the world as the "Steel City," and the iron and steel industry still constitutes the major and most

important phase of the city's industrial activity. For some years, however, the expansions in industries other than iron and steel have more than equaled the requirements of this major primary industry, as the diagrams show. This statement means that other diversified

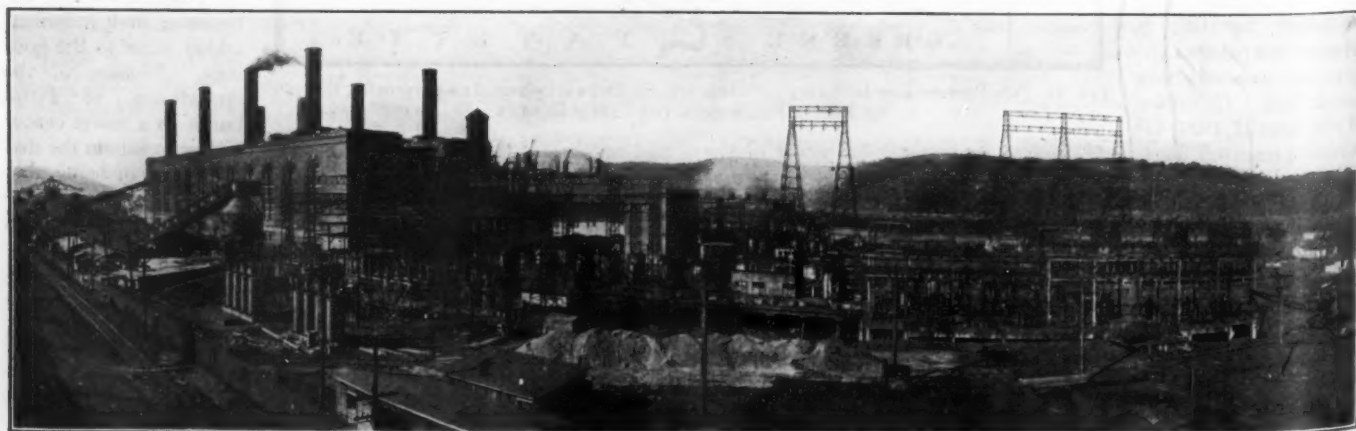

industries are accelerating and expanding at a much greater rate. Another outstanding characteristic of Pittsburgh power is the extensive use made of installed equipment. This is because much of the power developed in the district is for twenty-four-hour or continuous use, whereas in most other industrial centers the power is used as little as eight hours per day. This is partly because of the frame of mind of the Pittsburgh territory—which always thinks in terms of continuous operations—and partly because many of the industries of the district require continuous twenty-four-hour power.

This is further borne out in Fig. 2, covering purchased electric energy used in all industries of the Pittsburgh district except steel and iron. While the principal industry of the district—steel and iron—consumes relatively little purchased energy, it will be noted that the per capita consumption in the district with the principal industry omitted is greater than the average in the state. The state of Pennsylvania in turn uses more industrial power than any other state in the Union. When the operations in the steel industry are included, the energy used per capita in the Pittsburgh district is twice that of the state average.

Practically all of the activities of the people of the Pittsburgh district have to do with the use of power, either directly or indirectly.

COLFAX POWER CO., DUQUESNE LIGHT COMPANY  
Present capacity, 160,000 hp.; ultimate capacity, 400,000 hp.; "mouth of the mine" plant; additional unit of 80,000 hp. now under construction

WINDSOR POWER STATION, WEST PENN POWER COMPANY  
Capacity 180,000 kw.

This can best be appreciated when one realizes that the installed horsepower per workman for the city of Philadelphia is approximately four and a half; for the state of Pennsylvania, about four; and for the Pittsburgh District, slightly over six.

Fig. 3 is presented to show the installed industrial equipment as of 1922 in the Pittsburgh district, and indicates the relation between installed capacity in the iron and steel industry as contrasted with other industries of the district. Expressed in numbers, this means that 897,551 hp. are installed in the iron and steel industry, and 620,791 hp.—including motors for purchased power—are installed in other industrial plants of the district. In other words, 59.5 per cent of the total industrial equipment is in the iron and steel

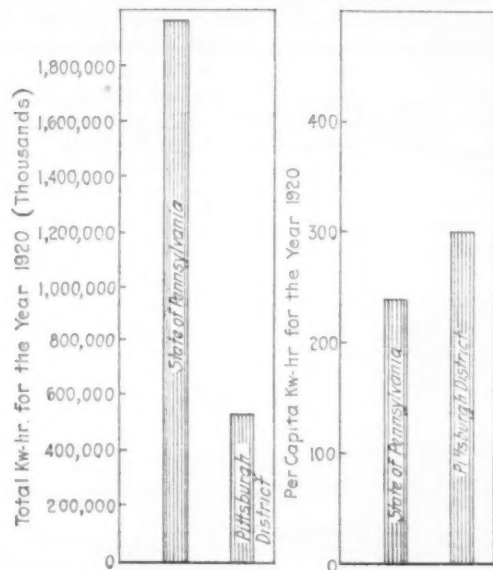

FIG. 2 COMPARISON OF TOTAL AND PER CAPITA ELECTRIC ENERGY SOLD TO ALL INDUSTRIES EXCLUSIVE OF IRON AND STEEL IN THE STATE AND THE PITTSBURGH DISTRICT

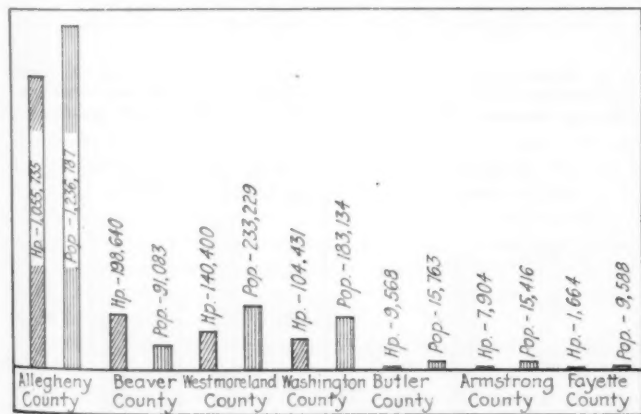

FIG. 4 POPULATION AND INSTALLED INDUSTRIAL POWER OF THE PITTSBURGH DISTRICT IN THE YEAR 1922

industry, and 40.5 per cent in other industries. It will be noted, however, from Fig. 7 that the consumption of energy (the horsepower-hours) in the steel industry is about twice that of other industries, although the installed horsepower of the former is only 59.5 per cent of the total.

Fig. 4 is presented to show the intimate relationship existing between installed power and population in that portion of the counties included in the Pittsburgh district. It is an old axiom that "population follows power," which coincidence exists in a striking way in these counties of western Pennsylvania. Heretofore the pronounced tendency has been to move people to the source of power; the effort of engineers and economists today is to move power to people economically. In other words, with the economical transmission of power this particular condition, which probably is largely responsible for congested cities, will no longer exist. In

Fig. 4 one is struck by the closeness with which the two lines for each county match one another. A study of geography and location of industry for the counties under observation shows that power development and industry heretofore have planted themselves adjacent to the rivers, accounting for the small volumes of power in Butler and Armstrong counties. With the efficient transmission of power this latter limitation will be removed, because with the development of large-unit central-station power plants placed adjacent to coal and water and whose primary and special business is the development of power, the manufacturer can locate his plant with relation to labor supply and to cheap, desirable lands, and rely upon unlimited power being delivered to his plant at a cost less than when he developed his own power. The tendency of industry and population to follow the river courses is shown in Fig. 5, in which each dot represents 1000 people.<sup>1</sup>

Fig. 6 is presented to show the trend in the capacity of installed horsepower for the iron and steel industry as contrasted with other industries of the Pittsburgh district shown by the full lines.

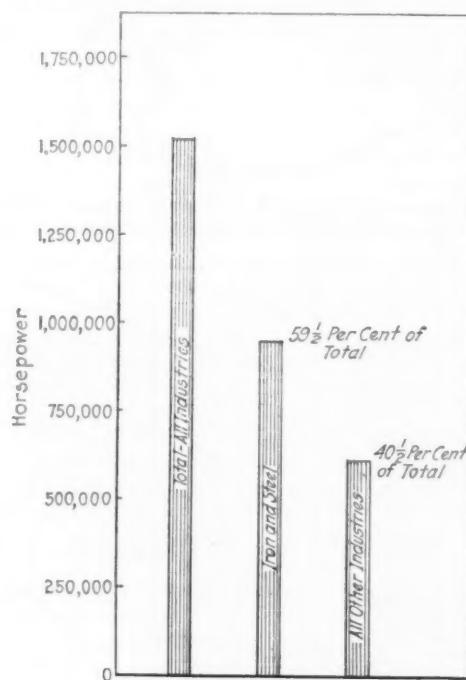

FIG. 3 PROPORTION OF INDUSTRIAL INSTALLED POWER IN THE IRON AND STEEL INDUSTRY IN THE YEAR 1922 IN THE PITTSBURGH DISTRICT

In connection with the other industries of the district, it is to be noted that prior to 1914 there was relatively little expansion in the power requirements of the other industries, whereas since that time there has been a marked and continuous growth in the power requirements of other industries. This change is the result of a continued growth in diversified industries for the district which is not generally appreciated. The curves indicate that the steel industry is much more uneven in its development than is the case with the rest of the industries; and if any average of these curves were projected into the future it would show the industrial curve to be steeper than the curve representing the iron and steel industry; which is only another way of again stating that the other industries as a whole are growing faster than the iron and steel industry in the Pittsburgh district. The iron and steel industry in this report is considered made up of blast furnaces, steel works, and rolling mills. The other industries in the district might be divided into two groups as follows:

#### Industries Requiring the Use of Metals:

- Brass, bronze, and copper products
- Cars and general shop construction
- Electric-machine apparatus and supplies
- Boiler shops

<sup>1</sup> The authors are indebted to the Pittsburgh Chamber of Commerce for this map.

It is interesting to note that this expansion generally is in the outlying districts and away from congested living conditions, as indicated in charts further on. This is a very significant fact and, as was mentioned in a previous paragraph, the present-day power possibilities may modify our living conditions in a very far-reaching manner.

To emphasize the relative importance of the corporate city of Pittsburgh and the Pittsburgh district, compare the three full lines with the three dotted ones in Fig. 6. In the case of most large cities the industries within the city proper usually dominate the district, but the condition is reversed in Pittsburgh. Although the city itself is a center of great activity, the surrounding territory has almost three times the installed power. Now, taking into consideration the time that this equipment is in service, Fig. 7 has been plotted, based on horsepower-hours consumed from 1909 to 1922.

It will be seen that the iron and steel power-consumption curve has risen very little since 1916 and in fact has a tendency to fall,

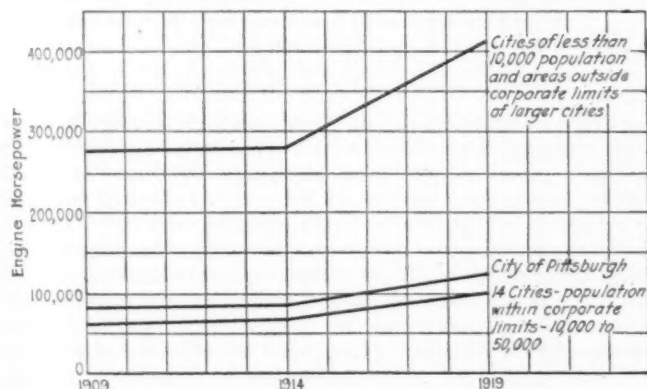

FIG. 10 INSTALLED POWER IN THE PITTSBURGH DISTRICT—ALL INDUSTRIES EXCEPT IRON AND STEEL

while the power curve of the other industries shows a marked increase. If this latter curve is projected into the future it indicates that there will be a large demand for power in the next few years in the Pittsburgh district other than that demanded by the iron and steel industry. This expected demand has resulted in large investments of the electric utilities in and adjacent to the Pittsburgh district. The large central stations that have been installed in recent years have made available cheap and relatively unlimited power, and there is no reason why the present rate of expansion and increase will not continue.

In some other studies the authors have made, the total industrial horsepower-hours in the entire state of Pennsylvania were found to be approximately twelve billion for the year 1922. This in connection with the total shown in Fig. 7 means that nearly one-half of the total industrial power of Pennsylvania is developed in the Pittsburgh district.

The two upper charts of Fig. 8 are to be compared with the two lower charts of the same figure, and indicate the difference in distribution of power in the steel and iron industry as compared with the rest of the industries. It will be seen that the steel industries purchase very little electrical power from the large central-station electrical companies, but that they possess considerable electrical generating machinery; whereas the capacity of the other industries for generating electricity is small and consequently they purchase a much greater proportion of their power from the electrical utilities.

It will be noted that no water wheels are shown as there is no water power in the Pittsburgh district. It is interesting to note that the internal-combustion engine has not increased over the period shown and that the steam installations have increased at about the same rate as the purchased electric power. A large part of this steam power, however, is converted into electric energy.

Fig. 9 is presented to show (1) the horsepower per establishment; (2) the number of wage earners per establishment; (3) the number of horsepower per wage earner; and (4) the percentage of purchased power to owned power for the Pittsburgh district, the city of Pittsburgh, and the state of Pennsylvania. These charts are self-explanatory and require little discussion. They emphasize the characteristics of the district, however, with respect to the volume of power required by the industries of the district.

Fig. 10 is presented to indicate graphically the pronounced trend of industry in the Pittsburgh district to establish itself in the outlying sections rather than in the congested city limits.

Corporate Pittsburgh within the radius of thirty miles is surrounded by 159 separately incorporated communities, towns, and cities (see Fig. 5); all of which, however, are part of industrial Pittsburgh in that business activities clear both physically and financially through corporate Pittsburgh.

Fig. 10 emphasizes what has developed to be the outstanding characteristic of this study: namely, the very pronounced tendency of industry to locate over a wider range of territory away from the congested centers and high-priced land. The figure shows three curves giving installed horsepower from 1909 to 1919. The lowest curve shows the total horsepower of the 14 cities within the district having populations of more than 10,000 each. As the curves show, by far the greatest expansion has been in the smaller communities. Without presenting specific data, the studies of the authors show that this movement toward outlying territory commenced in about 1905, and has progressed with the use of electricity as power. It should be said, however, that this expansion has not been at the expense of the city proper, because the growth of outlying territory always is reflected in the big city which serves as a nucleus for a large territory. The rapid developments in means of efficient power transmission and a coördinated network of power-transmission facilities, all emanating from economically located large-unit power plants, is sure to accelerate this fortunate movement. Because the purpose of the authors is to restrict themselves to a study of power, no discussion of the many advantages of this movement will be made. It is refreshing, on the other hand, to realize how well the movement is under way.

## Salvaging Waste Materials

THE basic principle of scrap disposal at the Schenectady Works of the General Electric Co. is that they classify scrap as early as possible for consumption at the mill or smelter where it will be used.

They sell generally to the mill from which they purchase the stock, since its offer is likely to be higher than the competitive price offered by dealers or by other mills. This applies to all metal scrap, except iron and steel, which they have found sells more advantageously to junk dealers than to the mills. If they were to sell the scrap without handling and sorting it would not bring in over 50 per cent of what they now get for it. Operating the scrap department costs them about 6 per cent of the selling price of the scrap and the profit yielded therefor can be plainly seen. Scrap comes to them varying from obsolete automatic machinery to the mixed grease and copper of wire-drawing dies. Large pieces are loaded right on the cars; smaller stuff comes in containers. The standard scrap can employed is simply a steel oil drum, punched with two lined eyelets for handling by grappling hooks or cables on cranes and hoists.

Scrap wire and cable are taken care of by burning off the insulation, the metal left being then sorted out and taken off to be remelted. Perhaps the most pretentious single operation in the scrap and salvage department has to do with the reclamation of babbitt metal. The only new material bought for the scrap department is metal for the babbitt room—tin, lead, antimony, etc. for rebuilding babbitt. A reverberatory melting furnace is operated for reclaiming lead dross, babbitt dross, etc. This furnace has a capacity of 25,000 lb. of metal in 24 hours.

Altogether the scrap and salvage departments employ between 45 and 50 men who handle about 50,000 tons of metal scrap annually that is worth at the present low market for scrap about \$1,700,000 which can be considered the minimum amount received.—R. S. Emmert, in *Factory*, September, 1924, p. 340.

# The Fairmount Pumping Station and Heating Plant

Particulars of Novel Features Incorporated in a New Station in Cleveland, Ohio, together with an Analysis of the Efficiency of the Various Steam Prime Movers Available for Water-Works Use

By L. A. QUAYLE,<sup>1</sup> CLEVELAND, OHIO

CLEVELAND'S new Fairmount Pumping Station and Heating Plant, located 3¼ miles from and 150 ft. above Lake Erie, has been constructed to meet the demand for an unusually varied service. Many of the features incorporated in its design and equipment present novel departures from conventional water-works and heating-plant practice, the most interesting of which are:

Turbines operating with 300 lb. steam pressure at the throttle and bleeding at 125 lb. gage approximately three times the quantity of steam required for straight condensing operation

Boiler- and pumping-room auxiliaries driven by water turbines having three independent supply systems to draw from, giving unusual simplicity and reliability

A large overhead coal bin for both continuous service and storage, with provision for easily transferring the coal from one section to another

A novel and simple type of air preheater incorporated in the smoke-flue design

The entire plant operated from the main operating floor, which makes possible the handling of eight main pumping units, four boilers, and all auxiliary equipment with an operating force of four men

The practice of testing all turbines, gears, pumps, blowers, and generators for main and auxiliary equipment in both the shop and after erection, rigidly adhered to.

In analyzing the characters of the various types of prime movers available, the results of the study made of the test performances of compound and triple-expansion engines and different types of turbines are given on a Mollier diagram in a form which visualizes the stages and cylinders in which the largest losses occur; and may contribute to directing the constructive attention of water-works engineers to the economies which can be evolved from entirely possible improvements in the efficiency of the steam-turbine type of prime mover.

## GENERAL DATA

The rapid growth of Cleveland with its corresponding rapid increase in water consumption has necessitated the working out and carrying on of a program of water-works construction which will require the expenditure of approximately \$50,000,000 between the years 1920 and 1940. Two long lake tunnels, three large pumping stations and filtration plants, two large reservoirs, and several hundred miles of trunk main extensions are the principal works to be built during this twenty-year period.

Fairmount Pumping Station and Heating Plant is the first of the stations to be built in accordance with this program, and it is designed to pump the maximum quantity of water that it is economical to distribute from this one location, due principally to the fact that it would be both difficult and uneconomical to lay more distributing mains to the centers of consumption of the various service districts.

Fairmount Station is located on a 75-acre plot of ground which includes two large reservoirs and the Baldwin Filtration Plant buildings, and is about four and one-half miles from the business center of the city and about one mile from the intersection of Euclid Avenue and East 105th Street, a rapidly growing business district to which it supplies steam for building heating purposes.

This station has four major and two minor functions to perform:

- 1 Pump raw water from the Fairmount Reservoir (elevation 170 ft.) at a maximum rate of 200 m.g.p.d. (million gallons

per day) into Baldwin Filtration Plant mixing flume, elevation 245.5 ft.

- 2 Pump filtered water from Baldwin Reservoir into the first high-service district at a maximum rate of 40 m.g.p.d.

- 3 Pump filtered water from Baldwin Reservoir into second high-service district at a maximum rate of 60 m.g.p.d.

- 4 Supply steam at pressures varying from 75 to 125 lb. in quantities from 5000 to 100,000 lb. per hr. to a municipal heating system which covers what is known as the Euclid-105th Street business and residence district

- 5 Supply steam at pressures varying from 3 to 10 lb. per sq. in. in quantities up to 15,000 lb. per hr. to the pumping station and filtration plant for heating purposes, the several filtration-plant buildings being approximately 3000 ft. from the station

- 6 Supply a.c. current to the pumping-station and filtration-plant buildings for lighting and power purposes at a maximum continuous rate of 400 kw.

## ANALYSIS OF STEAM-PRIME-MOVER EFFICIENCY

In spite of relatively low fuel costs and high labor costs, water-works engineers have always striven to obtain the highest efficiency for their prime movers from machinery builders. At certain periods, new types of machines of reduced first cost and poor economy have found application in the pumping of water. An early case of this is typified by the introduction of the direct-acting duplex steam pump, which was finally forced out (even though its efficiency had been raised remarkably by the application of the Worthington compensating cylinders, which made expansive working of the steam possible) by developments which raised the efficiency of the steam and water ends of the crank-and-flywheel machine to values which stand today as records in performance for steam engines.

The centrifugal pump has now found extensive use in this field following the perfecting of a suitable reduction gear for connecting it to a steam turbine. The application of the centrifugal pump and relatively small-sized steam turbine to water-works service has resulted in a steady improvement in the efficiency of both and in the development of noiseless reduction gears for connecting the two.

There are indications just now that water-works engineers are directing considerable attention to the use of higher steam pressures and temperatures along the lines laid down by the designers of large central-station electric-generating plants. It would seem, however, that they should extend their studies of means for improving the economy of a pumping station to include not only the gain that lies in the use of higher steam pressures and temperatures, but that gain which can be realized in the water-works steam turbine. With this in mind, a study has been made of available turbine proposals, as well as of test records of other water-works machinery and of certain turbines used for electric-generating service approaching the water-works turbine in size.

In general this study has included proposals for two of the Fairmount Station turbines for which information was available that would permit of determining the internal hydraulic efficiency of the different stages of the machines. The test data included for the other machines have been of such detailed nature that the hydraulic efficiency of the different elements of these machines could be studied. This study has been summarized by plotting the expansion lines for all the machines on Mollier (total heat-entropy) diagrams. The test data cover a vertical triple-expansion and a horizontal cross-compound pumping engine, a pure reaction turbine, a new special type of European turbine, and a Westinghouse-Curtis two-row impulse element. All of the machines studied have been supplied with steam initially superheated, and all but the special European machine and the Westinghouse have exhausted at a comparatively high vacuum.

The expansion lines for the Fairmount impulse turbines are

<sup>1</sup> Chief Mechanical Engineer, Cleveland Water Department. Mem. A.S.M.E.

Presented at the Spring Meeting, Cleveland, Ohio, May 26 to 29, 1924, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. Slightly abridged.

plotted on the Mollier diagram, Fig. 1, which also has expansion lines for all of the other units listed. The European Erste Brunner turbine test results are taken from a report made by Dr. A. Stodola of Zurich, Switzerland. The test results for the vertical triple-expansion pumping engine are from the official records of one of the Cleveland Water Department's Division Station units. The test results for the horizontal cross-compound pumping engine are those obtained on the official test of a recent installation for the city of St. Paul, Minn. The test results for the pure reaction turbine are from the shop tests conducted on a 5000-kw. 3600-r.p.m. Allis-Chalmers turbo-alternator unit now installed in the municipal plant of the city of Ashtabula, Ohio.

This study indicates that there is available to water-works engineers the possibility of an appreciable increase in the efficiency now obtained from the high-pressure stages or elements of the most generally used type of turbine in water-works service. It is a fact that is now rather generally understood that a steam prime mover is inherently more efficient when operating with steam superheated throughout the expansion range than when it employs moist steam. This means that, other factors being made equal, a turbine or engine expanding steam from a condition initially superheated down through the moist-steam field, should have a considerably higher efficiency in the superheat field than in the saturated or moist.

A study of Fig. 1 reveals that the reciprocating engines in the superheated field had the highest efficiency, it being in the neighborhood of 90 per cent. These engines, however, suffered due to the inability of their low-pressure cylinders to completely expand the steam.

The special European machine (Erste Brunner) was brought out with a view to overcoming the loss in efficiency unavoidably present when a Curtis type of stage or an insufficient number of Rateau stages is used.

The expansion line for the pure reaction turbine is favorable because it will be noticed the test covered a condition of relatively low steam pressure. The expansion line of the reaction turbine can also be taken as showing very plainly the gain inherent in the use of superheated steam when other factors are maintained on an equal basis. The expansion line for this machine was obtained by observations of the quality of the steam at different stages throughout the expansion. The expansion line of the Erste Brunner turbine contains one observation of the quality between the inlet and exhaust. The turbine was a two-cylinder machine and readings were taken of the steam pressure and temperature between the two cylinders. The engine expansion lines, especially that for the triple, also show plainly the inherent gain to be realized by the use of superheated steam. The quality of the steam at the exhaust from the high-pressure cylinder and from the intermediate-pressure cylinder was obtained from the test data with a fair degree of precision, so that the efficiencies given represent actual observed values.

Table 1, which summarizes the efficiencies obtained for expansion in the superheated and saturated fields for all of the machines, shows the relatively low efficiency of the initial Rateau wheel through which a large heat drop is absorbed, and which therefore runs at an inefficient ratio between the blade and steam velocity. Considering the form of the expansion line for the proposed Fairmount machines and the test results of the Parsons type obtained with relatively low steam pressure, it is apparent that commercial turbines of the sizes under consideration have not been designed with a sufficient number of stages to take advantage of the energy available in the high pressures and superheats of the steam supplied to them. It would seem as though the increase in economy which would be obtained would more than offset the increased cost of the additional turbine stages required to effect it. In general terms it can be stated that the engine will give efficiencies of 90 per cent

in the superheated field, while the best turbine efficiencies are between 82 and 86 per cent. These values compare with approximately 60 to 73 per cent for the Curtis type of two-row impulse wheel.

Only the very high overall efficiency of the triple-expansion crank-and-flywheel type of pumping engine has made it a successful competitor of the cheaper types of pumping machinery, since it has always been at a very great disadvantage as regards first cost, and at a somewhat lesser disadvantage as regards the limited capacities in which it can be built.

It is therefore not surprising in the light of the gradual increase in turbine and pump efficiencies that have been obtained during the last few years, that water-works engineers can no longer afford to pay  $2\frac{1}{2}$  times as much for a triple-expansion engine as for a

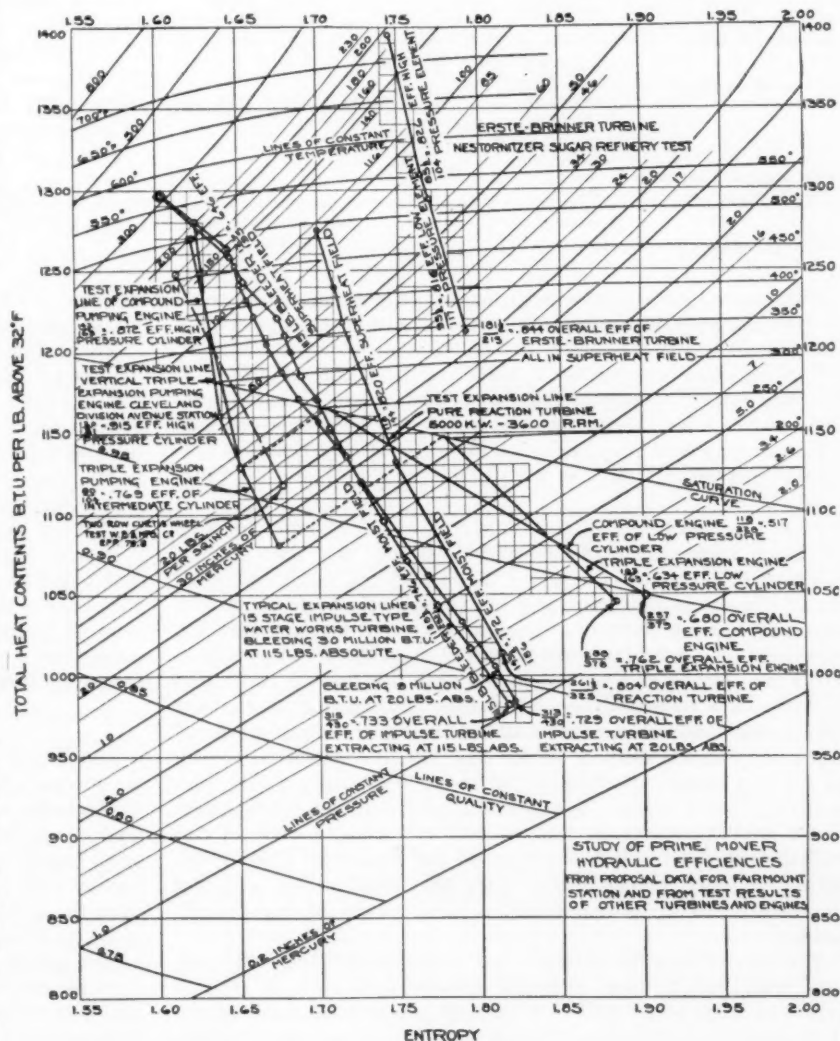

FIG. 1 EXPANSION LINES OF VARIOUS STEAM PRIME MOVERS PLOTTED ON A MOLLIER DIAGRAM

turbine-driven centrifugal pump with the possible exception of localities where fuel is very high in price.

In order to visualize what these gradual increases in the turbine gear-driven centrifugal type of pump mean, the author has computed the duty of a 30-m.g.p.d. pump of this type, working under a head of 250 ft. and developing 1315 water hp., the steam conditions being the same as those which obtained on the test of Allis-Chalmers engine No. 4 at Division Station, which, it is believed, holds the world's record for economy, and finds that a turbine gear-driven centrifugal unit can be built from practically standard equipment which will have a guaranteed Rankine-cycle efficiency of turbine and reduction gear of 72 per cent, a pump efficiency of 86 per cent, and, allowing  $2\frac{1}{2}$  per cent for auxiliaries, will have a duty of 154.7 million ft.-lb. of work per million B.t.u., compared with 173.8 obtained with the Allis-Chalmers engine at Division Station.

TABLE 1 EFFICIENCIES OF THE VARIOUS TYPES OF STEAM PRIME MOVERS STUDIED

Type of Unit	Construction of unit	Efficiency in Superheated field	Efficiency in moist field	Efficiency in high-pressure cylinder	Efficiency in intermediate-pressure cylinder	Efficiency in low-pressure cylinder	Overall efficiency <sup>1</sup>	Efficiency of first Rateau stage with superheat	Efficiency of Rateau stages, superheat field	Remarks

<sup>1</sup> Rankine-cycle efficiency ratio.

The erected cost of the centrifugal-type pumping unit would be approximately 40 per cent of the erected cost of the triple-expansion engine.

The foregoing comparison is made on the steam conditions of Division Station, namely, 220 lb. abs., 520 deg. Fahr. total temperature, and 28.2 in. vacuum, which, as far as is known, are as high a temperature and pressure as any engines of this type are now operating under. However, the turbine data are based on 29 in. vacuum.

It is a well-known fact that it is economical to build turbines for much higher temperatures and pressures than this, and for comparison's sake the duty of a 30,000,000-gal. pump operating under the same head-capacity conditions has been computed, assuming a steam pressure at the throttle of 500 lb. gage, 300 deg. superheat (or a total temperature of 767 deg. Fahr.), and a vacuum of 29 in. It has also been assumed that the turbine and pump builders allow their designers a free hand in designing for the best obtainable efficiency and that a turbine and gear having an overall Rankine-cycle efficiency of 79 per cent can be constructed as well as a pump having an efficiency of 88 per cent, and on this basis a duty of 200.5 million ft.-lb. per million B.t.u. can be expected. From present reports on the value of reheating, a duty of 216 million ft.-lb. per million B.t.u. could be obtained. This is the actual net duty, deducting the extra heat required for reheating the steam. These duties include 2 per cent for the driving of auxiliaries.

The cost of building turbines and pumps of this high-efficiency type would not be over 20 points greater than that of present types, so they would still cost only 60 per cent as much as the triple-expansion engine but would have a duty as much greater than that of the triple-expansion engine as the duty of the triple-expansion engine is now better than that of the turbine. It would seem, therefore, that the future demand by water-works engineers for large triple-expansion pumping engines will be very limited.

#### AIR PREHEATING

At the time this station was planned and its first equipment purchased—in the early part of 1922—there were no air preheaters on the market in this country, and very few data were available which could be used as a guide in making a decision as to its application to what is most probably the largest water-works boiler room yet constructed and which could not embody experimental applications such as are possible by the remodeling of an old plant when development work is carried on.

The gain from the use of the preheaters, as shown by authentic tests in marine boiler work and the experimental work done by the Cleveland Water Department in one of its old plants, in which a preheater made of old boiler tubes and plates was used, led to the

devising of a flue construction having incorporated in it a preheated intake air passage as a part of the forced-draft-blower inlet duct.

The entire absence of manufactured air-preheater equipment rendered it necessary to make the design in the Department, and this has been accomplished in a way that is expected to allow an appreciable amount of preheating without jeopardizing the successful and reliable operation of the plant.

The smoke flue is made of brick and tile with a thin steel plate separating the flue gases on their way to the stack from the preheated air on its way to the stoker-blower inlet.

A cross-section of the smoke flue and heater is shown in Fig. 2, and a plan in Fig. 3. Louvers in the preheater section control the distance the air travels over the steel plate, which in turn regulates its temperature. The air which is drawn into the preheater louver has already been heated somewhat by the heat radiated from the boiler settings.

#### NEW DESIGN OF COAL BUNKER

The Water Department's experience with two different plants, one having a large coal bunker and the other a small one compared to the boiler capacity, is fairly typical of the experience of others. Unless cars come with great regularity to the plant having the small bunker capacity, it is necessary to put a gang of men in the bunker with planks, wheelbarrows, and shovels to move the coal from the section of the bunker which supplies coal to boilers not in use to the section of the bunker in which the coal is low, or else a crew is put on to move the coal from the outside stock pile.

In the plant having a large bunker capacity the transferring of coal from the full to the empty sections of the bunker, either because it is needed in front of the boilers which are operating or because it is getting hot, is also necessary at times.

The design of the Fairmount Station bunker with its coal-handling equipment allows the transferring of the coal from one section of the bunker to another by the pivoted bucket conveyors. Approximately 80 per cent of the coal can flow by gravity through the boiler hopper spouts and 20 per cent can flow into the conveyors by gravity through the transfer spout. There is thus in effect a storage pile in the main coal bunker which can be transferred to wherever it is needed at the rate of fifty tons per hour with no labor other than the regular conveyor attendant.

The shower of coal dust which is sent to the boiler room when coal is transferred into the stationary or moving coal-weighing hoppers in our other stations will not have to be contended with in this plant. The boiler room should be practically free from coal dust.

#### HEAT BALANCE AND AUXILIARIES

Due to the large seasonal variations in demand for water and high-

and low-pressure heating steam, the heat-balance problem required an unusual amount of study for its efficient solution. Reliability of the main and auxiliary equipment was of major importance; and in the design of the plant and selection of its equipment ease and economy of operation were carefully studied.

In the main pump room all operation is done from the main operating floor. The only auxiliary equipment in the entire plant below the main pump, auxiliary, or boiler-room floors are the condensate pumps, of which each unit has one. These pumps are driven by small water turbines (from 1.7 to 3.5 hp.) and are supplied with raw water under a head of 100 ft. from either one of three of the low-lift main units, and discharge against a head of 20 ft. into the tunnel which connects Fairmount Reservoir with the low-lift pumps.

Should all of the raw-water pumps be shut down through a break in the main or other accident, a pressure-regulating valve on the first high-service system will open automatically and supply the necessary water for condensate-pump operation for the remaining five units. Should both the low-service and first high-service supplies fail, which is extremely unlikely, an automatic valve on the second high-service system will open and supply the necessary water for condensate-pump operation. Since both the first or second high-service systems have sufficient reservoir capacities to run these pumps for several days and since the maintenance on the hydraulic turbines should be practically nil, this type of drive for this plant is unusually reliable and should require practically no attention.

Due to the extreme simplicity and reliability and excellent economy of the hydraulic-turbine drive, the four stokers, two of the three oil pumps for the central oiling system, and one boiler-feed pump are also driven in this manner. The water turbines used are built from standard pump cases with suitably designed propellers. On shop tests it was found that the efficiency of the water turbines for a given set of conditions was equal to or better than the corresponding pump efficiency. One brake horsepower at the shaft of the turbine driving the boiler-feed pump requires only 16.4 lb. of steam at the throttle of the main-unit steam turbine. Even the 2.9-b.hp. condensate-pump water turbines require only 24.5 lb. of steam per b.hp. at the throttle of the main unit.

Another unusual feature of this station is the location of all auxiliary equipment (except condensate pump and stoker drives), such as stoker blowers, feedwater heaters and pumps, water-softening apparatus, turbo-generators, switchboard, central-oiling-system pumps and tanks, air compressor and vacuum heating and cleaning pumps, in an auxiliary room which is separated from the main pump room by a series of open archways. The fact that all of this auxiliary equipment is in a clean, well-lighted room under the constant observation of the chief operators, should do much toward increasing its reliability and decreasing operating labor and maintenance costs.

It is interesting to note that even if the steam pressure in the plant went so low that no steam prime movers could operate, the boilers could be fed from the hydraulic-turbine boiler-feed pump, and the stokers could be driven by the hydraulic-turbine drives.

Demand for high-pressure bleeder steam, which varies from none in the summer to 100,000 lb. per hour on a cold winter day, is supplied to the heating system by any one of four bleeder turbines; and the demand for low-pressure steam for station heating and filtration-plant heating is supplied by two low-pressure bleeder turbines and also by two mixed-pressure turbines if these are in operation.

The saving by using bleeder steam instead of taking the steam for heating out of the boilers and running the main unit straight condensing, will be approximately \$20,000 per year in 1935, when the station will have reached its maximum pumpage capacity.

Since none of the condensate from the steam sent into the municipal heating system is returned, the heating of this make-up for the eight heating months becomes an important item.

As the make-up water varies in temperature from 33 to 62 deg., with a weighted average of 41 deg. for the heating season, the heat in the exhaust steam from the main units, which otherwise is lost in the circulating water, is used to heat the make-up to approximately 95 deg., from which temperature it is increased to 210 or 220 deg., by the auxiliary exhaust and low-pressure bleeder steam.

The heating through the low-temperature range is accomplished by passing all the make-up water from the water softener through several rows of tubes in the top section of the condensers of three of the main units. These heaters heat both the condensate of the turbine and the make-up water.

The station is designed for the future installation of closed feed-water heaters which will receive the boiler feedwater from the open feedwater heaters at a temperature of 210-220 deg. Fahr. and heat it with steam from the high-pressure bleeder lines which also supply the municipal heating system, to temperatures varying from 350 to 400 deg. Under certain conditions a gain in overall economy of 5 per cent can be attained by this stage bleeding.

#### DETAILS OF STATION CONSTRUCTION AND EQUIPMENT

**Station Construction.** The foundations of the building and pumping units are on shale and the stack foundation on rock. The entire substructure is of concrete, the superstructure of steel with brick curtain walls. The interiors of the pump and auxiliary rooms are laid up with gray porcelain enamel brick with tile floors to match. Buff glazed brick are used in the boiler room, and in the machine, electric repair, and pipe shops. All the floors are made of reinforced concrete.

The plan of the operating floor of the pumping station, Fig. 3, gives the general dimensions and arrangement of the building; Fig. 2 shows the plant in cross-section.

The pump room is equipped with a 10-ton electric crane for handling the pumping machinery.

The auxiliary room, which is 26 ft. wide and one story high, with skylights in the roof, separates the main pump room from the boiler room and houses nearly all of the auxiliary equipment.

The floor above the pump room has well-lighted and well-equipped machine, pipe and electric repair shops, as well as a store room which is connected to the plant elevator by a monorail system. The chief engineer's office is on a mezzanine floor and overlooks the pump and auxiliary rooms.

**Main Pumping Units.** Three of the eight main pumping units, two of 75 m.g.p.d. and one of the 50 m.g.p.d., are supplied with raw water by gravity from Fairmount Reservoir and pump it into the filter plant, the total head on the pumps being approximately 80 ft.

The two first-high-service pumping units of 20 m.g.p.d. capacity each, are supplied with filtered water from Baldwin Reservoir under a head of 78 ft., and discharge it into the first high-service reservoir against an average pressure of 213 ft.

The three second-high-service pumps of 20 m.g.p.d. capacity each are supplied with filtered water from Baldwin Reservoir and discharge against a head of 478 ft., making the total net head on the pumps of 400 ft.

The three raw-water pumps and the two first-high-service pumps are of the single-stage, double-suction type. That shown in Fig. 2 is typical.

The single-stage pumps connected in series with the turbine would have been 41 ft. long or would have required a 10-ft. wider pump room than the other five pumps. The bidders were therefore requested to bid on pumps having two impellers in one casing.

All pumps have bottom suction and discharge nozzles which do away with the necessity of having steps over the discharge piping and gives the station the very best possible appearance.

**Reduction Gears.** The reduction gears for the 8 pumping units are of the standard DeLaval design; the spiral angle of the teeth is 45 deg. and the gear ratios vary from 1:5.2 for the second high service to 1:9.2 for the low-lift units. All pinions of the gears revolve in the direction which holds them down on their bearings as the load increases, but tends to lift the main gears. All gears are made sufficiently heavy so that this upward pressure is not sufficient to lift them from their bearings.

**Turbines.** Three of the eight turbines driving the pumps are designed to bleed steam out at a pressure of 125 lb. gage: two to bleed steam out at a pressure of 3 to 10 lb. gage, and two to bleed steam either at 3 to 10 lb. in the winter or take auxiliary exhaust steam in the low-pressure stages at from 0 to 3 lb. in the summer months.

The turbine types are so arranged that one of each type required will be in service under the minimum pumpage conditions.

Due to the high steam pressure and superheat the turbine casings are of electric cast steel, except the end of the casing which contains the exhaust nozzle. The turbine blades are all made of monel metal and are held in the disks by a shank-and-bulb construction. Fast couplings are used between the turbine shaft and the gear pinions and DeLaval couplings of the pin-and-rubber-bushing type are used between the gears and the pumps.

All diaphragms are of the built-up construction with the vanes of non-corroding material and are accurately assembled on the disks.

No flyball or sliding-weight type of governor with knife edges to wear or with springs, is used on these turbines. Instead, the pressure-volume characteristics of the gear-type oil pump, driven from the turbine shaft, is used. The oil pressure is increased in proportion to the square of the turbine speed, since the pump is discharging through an orifice of constant diameter, and this pressure acts directly on an operating piston connected with the turbine governing valve through a lever.

It is believed that this governing mechanism is as simple an arrangement as has yet been devised for units of this size. During the shop tests the speed regulation of the pumping units was excellent under changing loads, and the turbine speeds were changed 30 per cent under governor control. The author knows of no flyball type of governor which will do this.

**Coal and Ash Handling.** The main features of the boiler room and coal-bunker arrangement are shown in the cross-section of the plant, Fig. 2.

Coal is dumped out of the hopper cars into two concrete hoppers and conveyed by two steel apron conveyors to two coal crushers, whence it flows by gravity into two pivoted-bucket conveyors. The coal is weighed as the buckets carry it continuously over Blake-Dennison automatic scales; it is then discharged into the main coal bunkers which have a capacity of 3350 tons level full, or about fifteen days' supply for a continuous heavy load. The coal flows by gravity through the boiler-hopper spouts, which are equipped with Bailey meters, into the stoker hoppers.

The horizontal run of the conveyors is 168 ft. and the maximum vertical lift is 69 ft. 6 in. Each conveyor is driven by a motor through a worm drive.

The ash, after being ground by the clinker grinders, is discharged into the ash hoppers and then through hydraulic piston-operated gates into 30-cu-ft. industrial cars. These cars are run on to a hydraulic elevator which lifts them 8 ft. and the ashes are then discharged into hoppers which feed them into pivot-bucket conveyors, which in turn lift them to the ash bunker. The ashes are discharged out by gravity through two hydraulically operated gates into railroad cars or trucks.

**Boilers and Superheaters.** Four 1000-hp. Stirling boilers were installed instead of a greater number of smaller ones, since with softened water and proper furnace construction it should not be necessary to have a boiler down for cleaning or maintenance work but comparatively few days of each year. It is interesting to note that in one of the Water Department's old plants which had about half the boiler capacity, 17 boilers and 42 firemen were required. The boiler safety valves are set to blow off at 320 lb., and an average of 300 lb. is to be maintained at the turbine throttles.

The coal used by all of the Water Department plants is  $1\frac{1}{4}$ -in. No. 8 Ohio nut and slack, purchased on the B.t.u. basis, the following being the standard upon which the contract is based:

B.t.u. per lb.	12,600
Ash, per cent.	12
Moisture, per cent.	4
Sulphur, per cent.	3.5
Average volatile matter, per cent.	35
Average fixed carbon, per cent.	49

Coal of the above characteristics is comparatively low in cost, the average price before the war being \$1.60 per net ton delivered. The present price is approximately twice this. The type of stoker purchases and the boiler setting design are based on the use of this coal.

**Boiler Settings.** The boilers are set singly with 12-ft. 3-in. aisles between—see Fig. 3. Stairways and platforms between the boilers make all parts accessible for cleaning and maintenance work.

The settings are  $22\frac{1}{2}$  in. thick, of solid firebrick. The combustion chambers are lined with 13 in. of No. 1 Walsh or Farber brick, the outside 9 in. of Dover Buckeye brick. The tops of the boilers are covered with Sil-O-Cel brick laid on edge.

The mud drums are set 11 ft. high, giving 24.5 cu. ft. of furnace volume per sq. ft. of grate surface. The lower parts of the furnaces are lined with non-clinkering air-cooled Drake or Bernitz block, air being supplied to these blocks from main air ducts through cast-iron boxes of Drake design, or through carborundum blocks of Bernitz design. McLeod-Henry block are used above the air-cooled block for several courses on two of the furnaces.

**Stokers.** Two of the plants operated by the Water Department have natural-draft chain-grate stokers and one has underfeed stokers. Several years of operation have shown that the underfeed-stoker plant maintains approximately 7 per cent better efficiency year in and year out with the same degree of care in the firing, as compared with the chain-grate plants.

Burning the No. 8 Ohio coal, an average of 25 per cent carbon in the ash is about as good as can be obtained with the underfeed stokers without clinker grinders, at an average load of approximately 150 per cent of rating, whereas 10 per cent to 12 per cent would be a fair carbon content for stokers equipped with clinker grinders. Each stoker is driven by a water turbine directly connected to a Cleveland worm gear. The

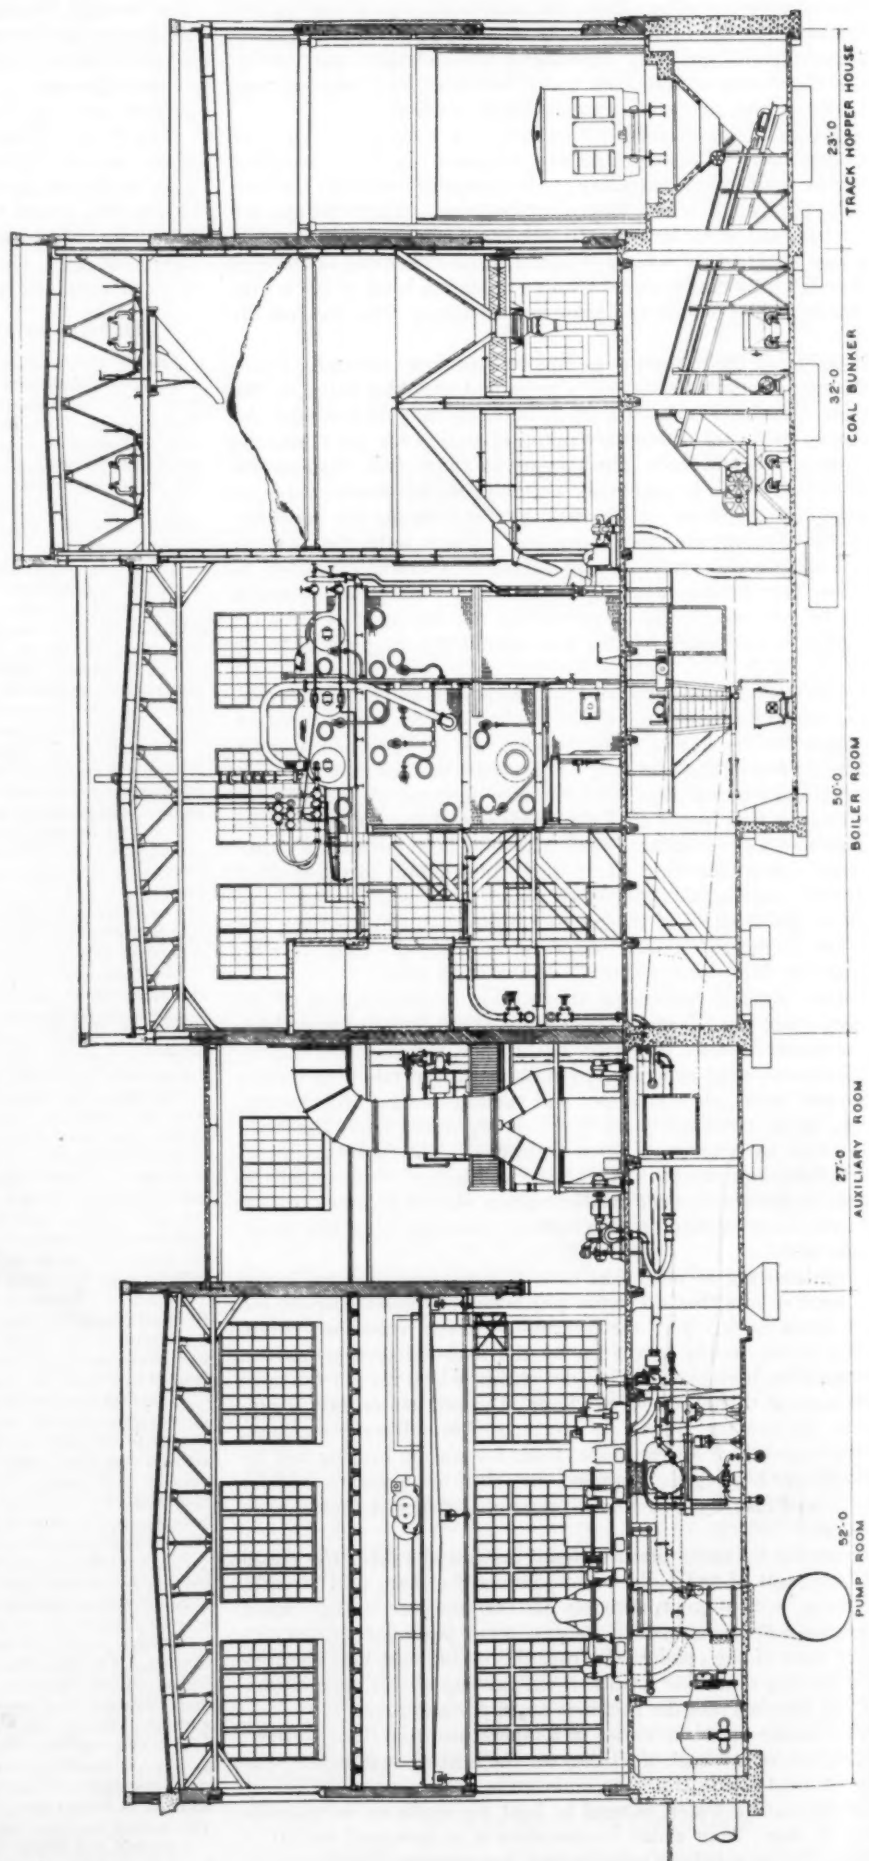

Fig. 2 CROSS-SECTION OF THE FAIRMOUNT PUMPING STATION AND HEATING PLANT, CLEVELAND, OHIO

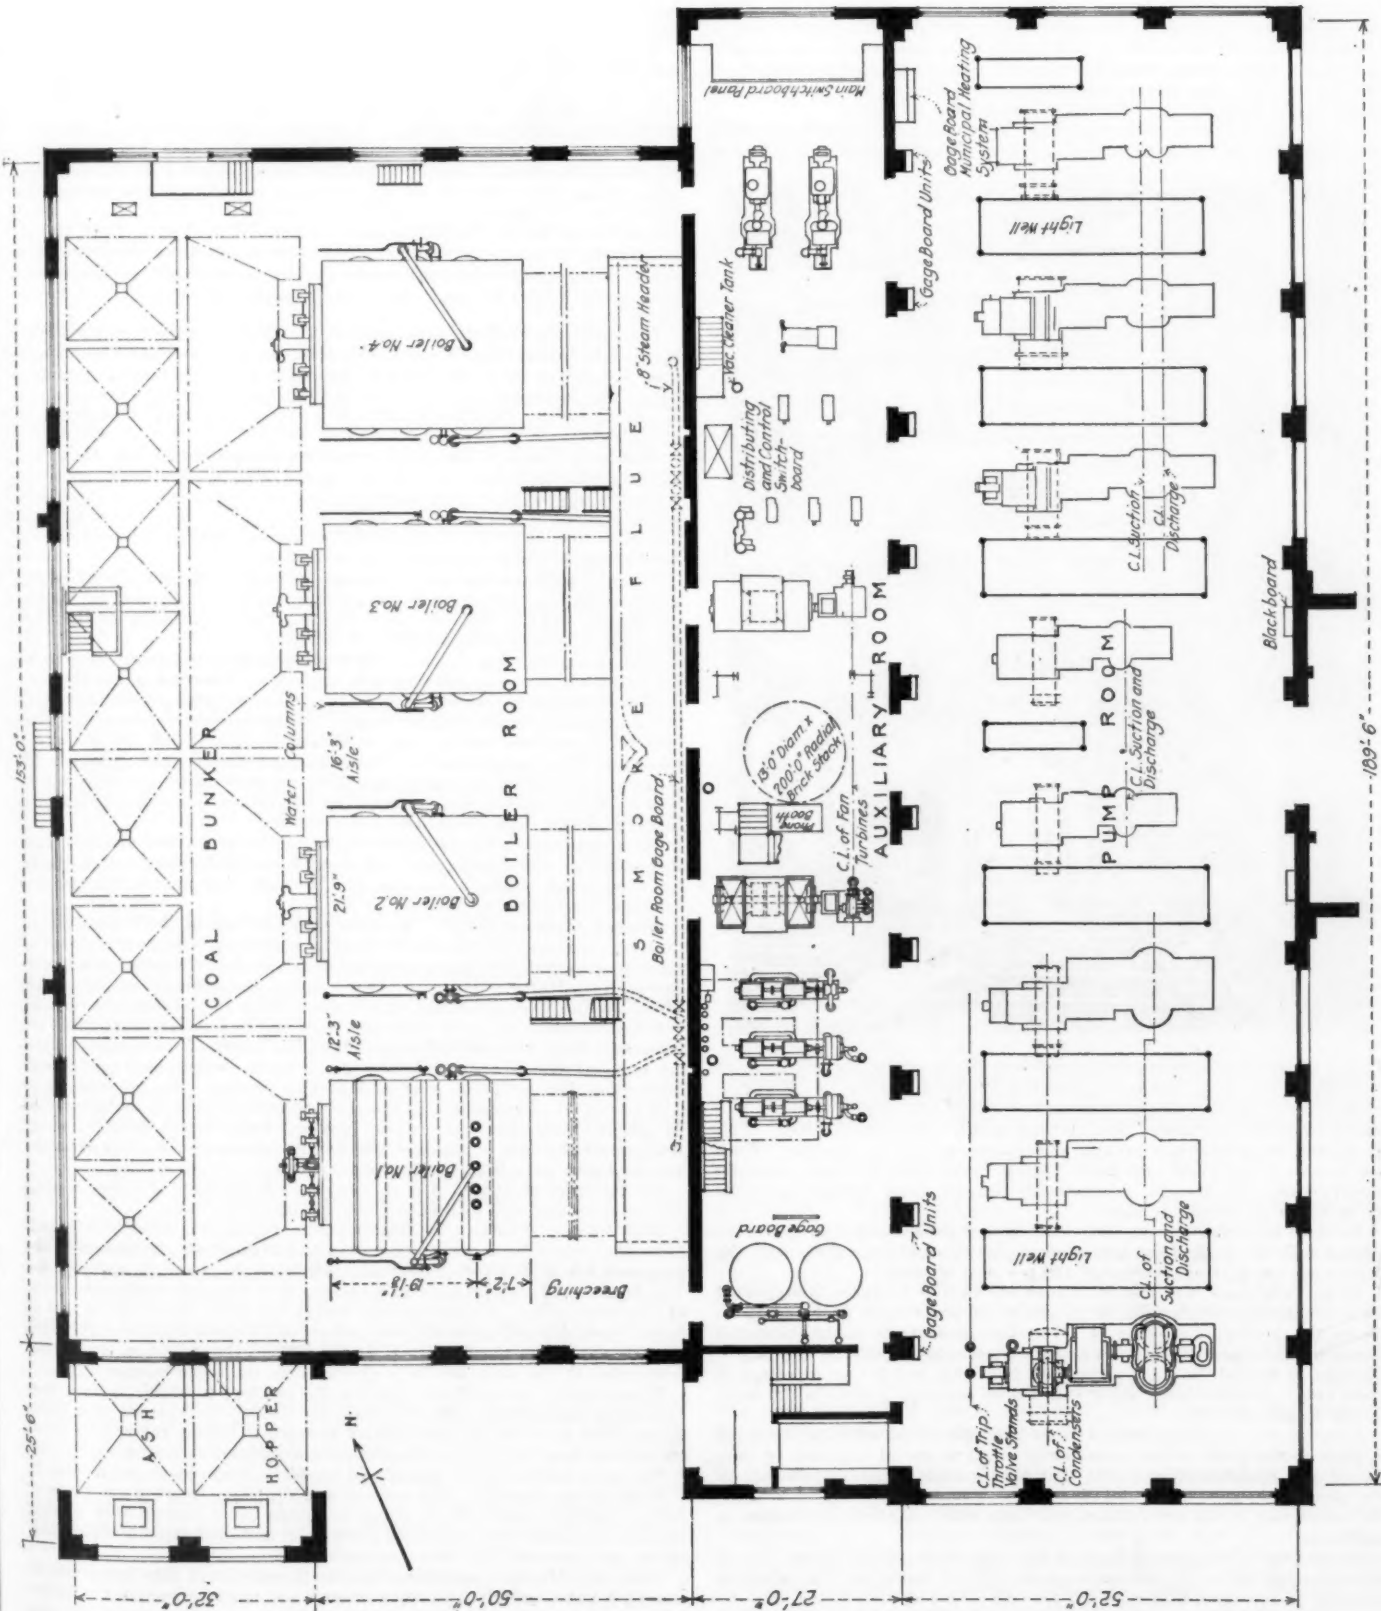

FIG. 3 PLAN OF THE FAIRMOUNT PUMPING STATION AND HEATING PLANT, CLEVELAND, OHIO

clinker-grinder gear box is driven from a chain and sprocket on an extension from the stoker driveshaft.

The Fairmount Station stokers are 10-retort Riley underfeed, equipped with single-roll clinker grinders and high side tuyeres. A year's service at Division Station with a stoker equipped with high side tuyeres showed a material reduction in sidewall maintenance costs compared with the lower type. The rate of coal supply to each half of the stoker can be varied by the two-speed gear box. The deep pit provided above the clinker grinder allows ample time for refuse to cool before discharge through the grinder. The rocker-plate apron forms one wall of the grinder pit and its continuous motion prevents the refuse from arching over the clinker grinder. The lower plates against which the ash is ground are stationary.

**Ash Hoppers.** The ashes discharged by the clinker grinder drop into Baker-Dunbar ash hoppers of the sectional cast-iron plate type with tile

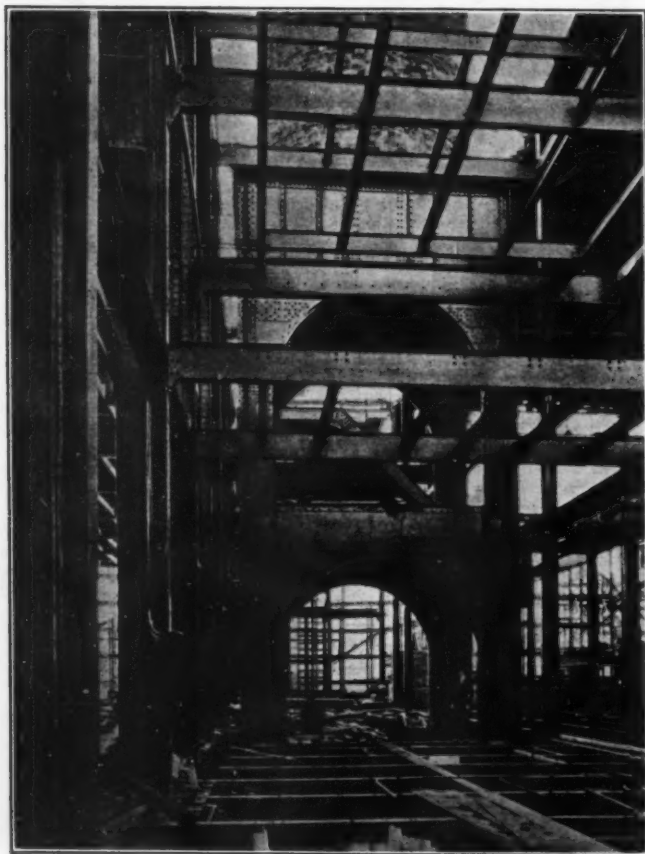

FIG. 4 STRUCTURAL-STEEL PLATFORM FOR SUPPORTING STACK 13 FT. IN DIAMETER AND 200 FT. HIGH

lining made of hard-burned flint firebrick which overlap each other. This lining will resist alternate heating and quenching without spalling. Each ash hopper is equipped with three "Arrow" type gates of heavy cast-iron construction, with integral mechanically cleaned water troughs, operated by a single hydraulic cylinder.

As these hoppers have an active ash-storage capacity of 350 cu. ft., no laborer will be required for ash removal in two eight-hour shifts with the boilers operating at an average of 150 per cent of rating.

**Stack.** The stack, which is 200 ft. high and 13 ft. in diameter, is supported on a structural-steel platform 43 ft. above the boiler-room floor and 55 ft. above the footings. See Fig. 4. The flue gases have an unobstructed flow into the bottom of the stack and the friction loss should be very slight. One square foot of the stack serves 30.1 boiler hp. and 5.7 sq. ft. of active grate area. A radial-brick lining with a 2-in. air space is built in the stack to the height of 40 ft.

**Economizers.** Looking forward to the time when coal will have increased in price to the point where economizers of an approved type can be purchased and maintained at a cost that will warrant their installation in the plant, the boiler room and its equipment have been designed to allow the installation of the economizers and fans with only minor charges at such time.

**Forced-Draft Equipment.** Each of the two forced-draft blowers has a capacity of 82,000 cu. ft. per min. against 6 in. of water pressure, which is sufficient to run three boilers at 225 per cent of rating with 60 per cent excess air.

The blowers are the Buffalo-Forge Conoidal type and are driven by DeLaval non-condensing geared turbines. These blowers are located in the auxiliary room, as shown in Fig. 2, and take air from the preheater section of the main smoke flue.

**Water Softening.** Since none of the condensate from the steam supplied to the municipal heating system mains is returned to the Station, the feed-

water make-up will at times amount to over 100,000 lb. per hr. Lake Erie water has slightly less than eight grains of hardness per gallon and can be softened to zero hardness by the use of zeolite at a cost of regenerating of approximately \$0.50 per 100,000 lb. The equipment selected is made by the Wayne Tank and Pump Company and has a capacity of 320,000 gal. in 24 hr. The regenerating units are in duplicate and a salt storage tank on an upper floor holds sufficient salt for 20 days' regeneration under average operation.

**Feedwater Heating.** The feedwater heater is of the open type of cast-iron sectional construction, made in twin units and of Cookson design. Two make-up valves controlled by floats are used, one small one for summer operation and one larger one for winter operation. The heater trays are made of cast iron and are readily accessible. The steam vented from the heater to keep it from getting airborne passes through a Riley heater on its way to the stack. A small portion of the feedwater passes through the Riley heater and condenses the steam that is vented, thus recovering most of its heat. A pressure varying from atmospheric to 10 lb. gage is maintained in the heater, depending on the season of the year. Both the exhaust from the steam-driven auxiliaries and the low-pressure bleeder turbines are discharged into a common header leading to the feedwater heater, and the pressure in this system is regulated by diaphragm control of the bleeder turbines.

High-pressure bleeder steam is not only available for the municipal heating system, but can also be used for heating the feedwater in a closed heater after it has been heated by the open heater to a temperature of 210 to 220 deg. The feedwater can be raised in the closed heater to temperatures exceeding 300 deg. by this method, with an increasing overall plant economy of approximately 5 per cent.

**Feedwater Pumps.** The three feedwater pumps are of the Rees Ro-Turbo design and made up of units consisting of two four-stage split-case pumps connected in series with the turbine drives and designed for 365 lb. working pressure. Two of the units are driven by Kerr steam turbines and one by a Rees Ro-Turbo hydraulic turbine taking its water from a connection to the second-high-service system.

The hydraulic turbine used is a standard four-stage centrifugal pump taking second-high-service water at a pressure of 478 ft., piped to the suction connection, and the discharge connection is piped to discharge into Baldwin Reservoir, giving a back pressure of 78 ft.

**Electric Lighting and Power.** The electric lighting and power system for the Fairmount-Baldwin project will be supplied with current by two 200-kw., 2300-volt, 80 per cent power factor, 3-phase, 60-cycle turbo-generators located in the pumping-station auxiliary room. The guaranteed steam consumption of the Kerr turbines driving these small units is 32½ lb. per kw-hr. at full load, with 2 lb. back pressure. Distribution of power to the various buildings will be by means of underground 2300-volt feeders from the main switchboard. Each building will be served by two cables, one normally carrying lighting service and the other power service.

**Air Compressor.** Air for operation of air tools, turbine cleaners, etc., is supplied by a 3-cylinder, vertical, motor-operated Westinghouse Airbrake Co. compressor having a capacity of 176 cu. ft. free air per minute, and arranged for automatic control.

**Vacuum Cleaning System.** In order that the tops of the boilers, smoke flue and other parts of the station may be kept clean with as little labor as possible, a vacuum cleaning system has been installed, consisting of a motor-driven Nash-Hytor pump with a water-spray dust-removal system. This pump handles 80 cu. ft. of free air per minute with 9 in. of mercury vacuum.

**Oiling System.** All main units and most of the auxiliary equipment are lubricated from a central oiling system. The larger of the pumping units are supplied with oil at the rate of 50 gal. per min., which takes care of both lubrication and reduction gear and bearing cooling. An oil pressure of 5 lb. per sq. in. is maintained at the shaft centers of the units and is supplied by gravity from either one or two 1200-gal. tanks in the auxiliary room. An automatic alarm is provided which rings whenever the oil level in the supply tanks gets 9 in. lower than normal.

Oil velocities of 2½ to 3½ ft. per sec. are used for the lines feeding the turbines and 1½ to 2 ft. per sec. for the drain lines.

**High-Pressure Piping.** All high-pressure piping, including flanges, dimensions, raised faces, length of valves and fittings, etc., conforms to the proposed A.S.M.E. 400-lb. Standard. All joints on pipe 3 in. and over are Van Stone. All high-pressure gate valves are of cast steel with monel trim, of Chapman make. The non-return valves and globe valves are of cast or forged steel, depending on the size, and are of Edwards manufacture. Trip throttle valves are the Schutte-Koerting make. One valve on each boiler connection at the main header is operated by the Dean control unit.

When there is not sufficient load on the turbines to obtain the required amount of high-pressure bleeder steam for the heating system, it is taken direct from the high-pressure header through a Borsig valve with Dean control equipped with an automatic pressure-regulating device.

The main piping in the pump and auxiliary rooms is shown in Fig. 2. **Main Pump Headers.** The suction and discharge headers are made of flanged cast-iron pipe. Each pump discharge has a venturi tube located beyond the check valve, and both the suction and discharge valves on each pump are operated by Dean controls.

**Gages and Meters.** Approximately one hundred and fifty indicating or recording gages, meters, and thermometers are required to give the proper indications and records for this plant. The steam-flow meters for the heating line are of the General Electric mechanical type. The boiler-feed meters are of the Builders' Iron Foundry make. The indicating and recording gages are of the Foxboro make. All pump-room meters and gages are designed for flush mounting on gage boards. Both indicating and recording gages have micrometer pen-arm adjustment. All recording gages and meter charts are driven by Warren electric clocks.

# Design, Manufacture, and Production Control of a Standard Machine

By RALPH E. FLANDERS,<sup>1</sup> SPRINGFIELD, VT.

*This paper describes the methods by which difficulties in manufacture and production control were avoided by the Jones and Lamson Machine Company. The company having passed through a period of increasing speeds and feeds, and improvements in methods of doing work and controlling it with satisfactory results as to total machinery time and direct labor cost, directed its attention to overhead which had suffered a considerable increase due to foremen, clerical work, and cost and production offices necessary for methods which had been adopted.*

*Reorganization commenced with a segregation of the products in manufacture so that separate manufacturing organizations and equipments were provided for each product. A redesign of the product was then undertaken to eliminate as many parts as possible and to standardize parts to fit several types of machines. The shop was arranged on a basis of departments by products. The author describes the turret-lathe shop, the chief manufacturing processes involved, and the routing and stock-room control.*

*The principles sought to be established in this work were: Standardization of product; a separate manufacturing equipment and organization for the product; departmentalization by product rather than by process; a recurrent production schedule; concentration of plant; minimized transportation; disturbing and difficult factors confined to purchasing; visual control of work itself instead of remote control by records; control by orders instead of by records; automatic control of inventories; cost figuring by analyzing total rather than by totaling innumerable details; a plain job for every man and full responsibility with it.*

A LITTLE over twelve years ago the author became connected with the Jones & Lamson Machine Company. About that time—or a little earlier—the management of the company began an intensive campaign for the increase of speeds and feeds, improvement in methods of doing work and controlling it, and development of all the other lines of progress which in general come under the head of “scientific management.” This work was guided at time by members of the company’s own force, and at times by an outside organization of specialists.

The net result of this several years of effort was decidedly profitable. Speeds and feeds were greatly increased, and the total machining time and total direct labor cost of the product noticeably reduced—and this in the face of considerably increased earnings to the men. All of this is, of course, the expected result of successful work of this kind.

About four or five years ago, however, we lost the first keenness of our interest in direct labor cost and became concerned with the “overhead.” With only a moderate increase in output, there had been a considerable increase in the number of foremen—functional and otherwise—and a great increase in the amount of clerical work they were called on to do. In fact, it had become necessary to provide many of them with clerks.

There was also a violent increase in the personnel of the cost and production offices. The attempt to control the whole organization from a central point led also to a flood of written orders and reports, which was evidenced by the multitude, variety, and size of our printing bills.

It was possible, at any time and at any point in the shop, to make a rough estimate as to the percentage of the men in sight who were at that moment actually engaged in the processes of profitable manufacture, and to find that percentage quite unsatisfactory.<sup>2</sup>

Finally, the general statistics of the plant showed that the direct labor cost of the product was very small—as had been hoped;

it showed the material cost as much higher; but the manufacturing overhead was largest of all—so large that with a moderate selling expense the percentage of profit was somewhat precarious. The percentages were, in fact, such that if the item of direct labor cost had been completely eliminated, there still would not have been any extraordinary profits at the selling prices prevailing.

We are not the only manufacturers, or the first, who have made this interesting discovery. But whenever and wherever made, this discovery is a matter of the highest importance, and should lead to a radically changed treatment of the problem of management.

It was evident that in our case progress toward efficiency in direct labor cost had reached the point where the “law of diminishing returns” became effective, and further effort in that direction would be unprofitable. We therefore transferred our attention to the other elements of cost, and particularly to the largest of them—the manufacturing overhead.

The overhead cost had not grown to its preponderant dimensions suddenly or through carelessness. It was the result of slow

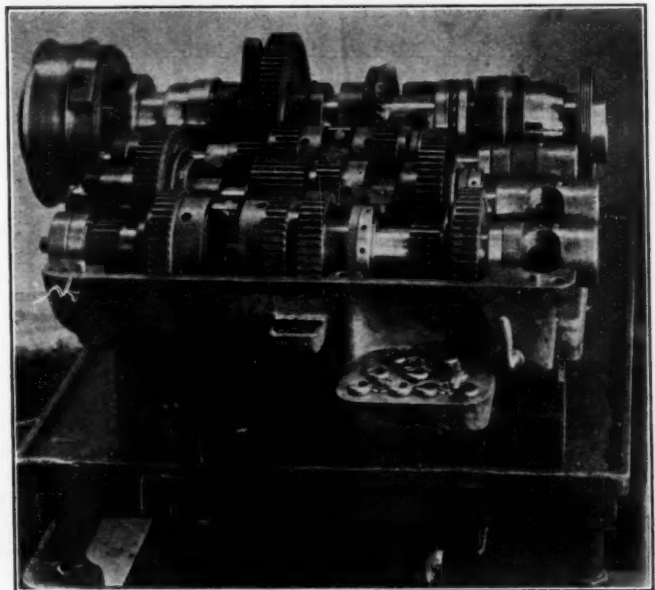

FIG. 1 HEADSTOCK OF 3-IN. FLAT TURRET LATHE

accretions of small expenses, each added to take care of some real difficulty in management in what looked, at the time, like the simplest and least expensive way. An examination of the various details did not indicate that they could be successfully improved by individual treatment. A major operation seemed to be “indicated,” as the doctors say.

To put it briefly, the major operation decided on consisted in rearranging all the elements of the business so that difficulties were avoided rather than overcome. These radical changes are detailed in the following paragraphs.

## SEGREGATING PRODUCTS IN MANUFACTURE

The oldest and principal product of the company is the Hartness flat-turret lathe. Other important products are the Fay automatic lathe and the Hartness automatic opening die. A beginning in segregation had been made some years before in developing the automatic die into a separate business, with its own manufacturing organization and equipment. The Fay automatic was first assembled in a department of its own; it was now in turn provided with a practically complete equipment for making all its parts and given separate quarters.

In the turret-lathe division the work was of two kinds—the manu-

<sup>1</sup> Manager, Jones & Lamson Machine Co. Mem. A.S.M.E.

<sup>2</sup> This visual estimate, it may be said, is quite useful and revealing practice, and every shop manager who has not acquainted the habit should contract it at once. It should be made with a view to criticizing the management rather than the workers.

Contributed by the Machine Shop Practice and Management Divisions for presentation at the Annual Meeting, New York, December 1 to 4, 1924, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. All papers are subject to revision.

facture of new machines, and a rather large service business in the supply of replacement parts for the machines (numbering some 15,000) now in the users' hands. Many of these parts were obsolete, being for machines of a design established in 1893. The others were of the then current design, established in 1905.

The final, and significant, act of segregation consisted in separating the service department completely from the turret-lathe production and putting it with all other special work into a division of its own. Here it was united with the manufacture of regular

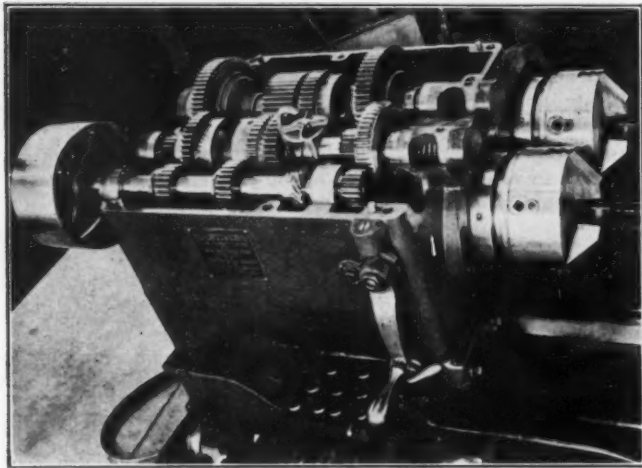

FIG. 2 HEADSTOCK OF DOUBLE-SPINDLE FLAT-TURRET LATHE

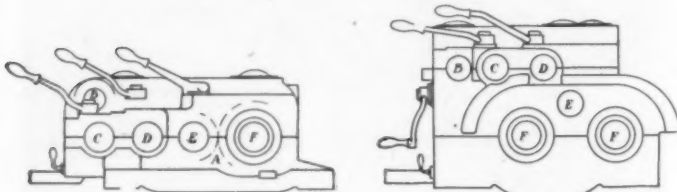

Fig. 3

Fig. 4

FIG. 3 END ELEVATION OF 3-IN. HEADSTOCK

FIG. 4 END ELEVATION OF DOUBLE-SPINDLE HEADSTOCK

and special equipment for our customers, and the building of tools, fixtures, and special machines for ourselves.

Thus everything irregular, spasmodic, and unpredictable was assigned to this special department, while steady machine production, on a more easily predetermined program, was concentrated in the section devoted to machine building. By working toward regularity and routine we hoped to reach conditions under which a considerable element of the overhead expense would become unnecessary.

Meanwhile there was another element conducing to irregularity which had to be taken care of. While the department could be run under general orders to produce a given number of machines per week, there could be no foreknowledge far in advance as to how many of them should be "2 $\frac{1}{4}$ -in. machines," how many of them "3-in. machines" and how many of them "double spindles"—these being the shop terms for the three styles in which the turret lathe was built. These machines were designed on the same general plan, and many of the parts in the 2 $\frac{1}{4}$ -in. and 3-in. machines interchanged, but this was not true to any extent of the double-spindle turret lathe.

A redesign of these three types was therefore undertaken to make them as nearly alike as possible, not only in their separate individual parts but also in their unit assemblies. This redesign was so successful that we are now able to assemble three basic sizes (or, with varying equipment, seven types in all) from the same parts with the following variety of major castings: 2 headstocks, 2 spindles, 2 beds, 2 turret slides, 3 turrets, and a few minor parts.

Figs. 1 and 2 show respectively the 3-in. and double-spindle headstocks. In the elevations, Figs. 3 and 4, the same shafts are marked by corresponding letters. These shafts, with their complete assemblies of gears, clutches, ball bearings, etc., as well as

the spindles and their gears and boxes, can be interchanged in either headstock. Except for one or two minor points the man who assembles one of these shafts need not know into what style of machine it is going.

For a 2 $\frac{1}{4}$ -in. headstock, with its higher spindle speed, the driving-gear ratio at A in Fig. 3 is altered, and a spindle with a different nose used. About the only criticism which could be directed against this redesign relates to using the powerful 3-in. drive on this 2 $\frac{1}{4}$ -in. machine. It is much more powerful than is needed. *But it is cheaper to make it alike and heavier, than lighter and different.*

Besides bringing the design of the machines together, the variety of parts in a given machine was greatly reduced. For instance, the design of the friction clutches on the different shafts was made the same. These are of the multiple-disk type. On the fast-running shafts with light torque, thicker and fewer hardened disks

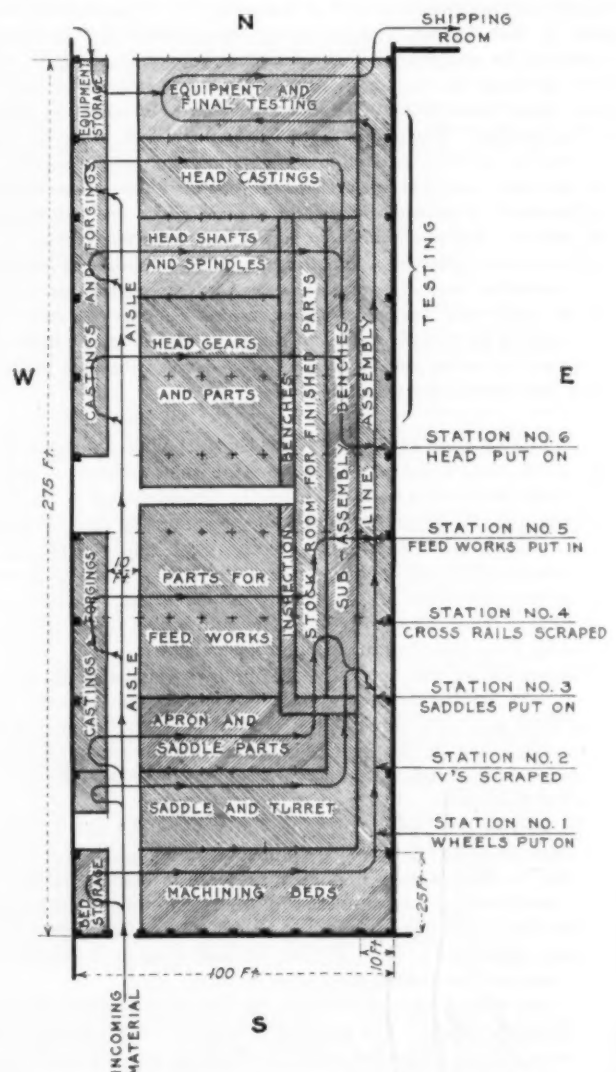

FIG. 5 GENERAL ARRANGEMENT OF TURRET-LATHE SHOP

are used. On the slow-moving shafts with heavy torque, more and thinner ones are employed. All of this work practically cut in half the total number of kinds of parts to be dealt with in making the full line.

The three basic sizes of machine having thus been unified in design, they became for all practical purposes one machine. The workmen scarcely know which size they are working on. They may be put through the assembly in groups of fifteen or twenty each, or mixed together indiscriminately, without making a break in the routine of manufacture.

This unification of the product was in reality a return, in a more developed way, to the first principles followed by Mr. Hartness who confined the work of the shop from 1892 to 1905 to one machine and one size of machine. It is needless to say that now, as

then, the range of the machines built was carefully determined to cover the largest practicable percentage of the lathe work of the world, in order to give the broadest possible market for our intentionally restricted line.

#### SHOP ARRANGEMENT

We now come to the most interesting physical feature of the problem—the arrangement of the shop.

There are two methods of arranging departments—by process and by product. By the former plan all milling is done in a milling department, all drilling in a drilling department, all turning in a lathe department, etc. The argument for this is that by specializing on a given operation the foreman and his assistants become highly skilled in that work, doing it better and more cheaply than if they were concerned with a wide range of operations. The disadvantages lie chiefly in the constant movement of work from department to department, with its consequent slowing up of the work flow, division of responsibility, and difficulty of control.

Arranging the departments by product means that any individual piece stays in a single department until it is completely finished, ready for assembly. Such a department may be arranged to complete all parts of a similar nature, no matter where found in the machine, or all parts of whatever nature belonging to a given assembly unit of the machine. Both arrangements are to be found in automobile manufacture, where departmentalization by product is the rule in the larger and more successful shops.

In this turret-lathe shop it was decided to departmentalize by product, primarily on the basis of the unit assembly, and only secondarily by similarity of parts. This arrangement was expected to prove strongest where the method by process was weakest; and its single disadvantage, lack of specialization by the foreman, was believed (and later found) to be largely illusory.

The space available was 275 ft. long by 100 ft. wide, divided by columns lengthwise, as shown in Fig. 5, into 10-ft. aisles, and crosswise into 25-ft. bays. Experience with this shop leads us to believe that about this width of shop and width of cross-bays are ideal for medium-sized manufacture. The columns should, however, be spaced to give 20-ft. aisles, as has been done in our later construction. The later buildings are also increased in width to 120 ft. Such shops may be built to any length required by the magnitude of the production. The building referred to is of steel-frame, sawtooth-roof construction and fireproof.

The general arrangement is indicated in Fig. 5. The incoming material passes north up a long aisle extending the full length of the shop. In the aisle on the left, next to the west wall, are the bins in which the raw material is stored. The center of the shop is occupied by the various manufacturing departments, after which comes the equipment and final testing of the machines.

In successive aisles toward the east, and running for practically the full length of the manufacturing section, come the inspection benches, storage of finished parts, sub-assemblies and line assembly. From the line assembly the finished machines detour into the bay for equipment and final testing, and out into the painting and shipping room.

The flow of material is thus from the southwest corner north to the appropriate department, thence directly east across the width of the shop to final inspection and storage, thence to sub-assembly and line assembly. The line assembly moves north on the eastern side and out at the northeast.

Let us follow the progress of the bed. The arrangement of the machines for its department is shown in Fig. 6. The castings are stored at the west of the aisle. From there they are taken first to an Ingersoll mill, where the pads on the bottom are milled off, after which the bed is turned over and the cross-rails milled. Space for a second mill is left as shown by the dotted lines in Fig. 6. The bed now goes to the roughing planer, and thence to the horizontal boring and milling machine. The next location is the radial drill. Here the bed is held by the V's or special fixtures, and light sectional jigs are used for the drilling.

The machining is now nearly completed, and the bed rests for a time on the floor. It then goes to the finishing planer to scrape the V's. This is a final machining to remove all "wind" so that the hand scraper's job shall be one of finishing the surface rather than of removing material. The bed is now mounted on wheels instead

of its regular legs, and is ready to start up the assembly line—of which more later.

The important things to observe are the permanently mounted fixtures (adjustable for the two styles of bed), the simplicity of the operations, and the unvarying routine of the procedure. The department is under the foreman of the line assembly, but as a matter of fact it is practically self-managing.

The "saddles" (turret slides) and turrets, machined in the next department, are also large pieces. The layout is shown in Fig. 7. When completed these parts shift north to the appropriate point in the sub-assembly aisle.

The apron and turret-slide parts in general comprise main castings, gears, shafts and studs, and milled steel parts. The layout for this department, Fig. 8, shows three lines of tools. The upper or northern line, comprising mills, drillers, etc., takes care of the castings and milled steel parts. The lower or southern line, composed of turret lathes, machines the shaft, studs, and gears which, however, pass north at the end through the Fellows gear shaper and the Bryant internal grinder on their way to the inspection bench and the parts storage. The central line is composed of miscellaneous machines common to the other two.

This arrangement exemplifies the subdivision of the departments on the basis of the character of the parts machined. A similar case is shown in Fig. 7, where the turrets go east along the south side, and the turret slides east along the north side. In this way the flow of every part can be made to approximate a straightforward progress from west to east, with only occasional and minor divagations. This makes for ease of control and orderliness in the department.

The layout of the department for machining feed-works parts is as shown in Fig. 9. Here again we have separate lines of machines for different classes of work, as indicated on the layout. From the machines the work is handed over to the inspection bench and thence to the stock room. From there it goes to the sub-assembly and line assembly.

The head-gear department is laid out as shown in Fig. 10, and the shaft and spindle department as in Fig. 11. A pair of Fay automatic lathes are kept set up with an adjustable, but standard, equipment for the shafts. The succeeding spline millers, drills, and grinders are plainly indicated.

The head-castings department is interesting for its specialized equipment. The bases are planed on the bottom, then caps and bases are milled for the joint. After drilling together, the united headstock goes to a special boring machine, when all the shaft and spindle holes are rough and finish bored, reamed, faced, and tapped at one setting. The machine for this work costs much less than a standard boring machine and jig for the same purpose, and finishes all the holes at once instead of one at a time. This is an example of the economies possible in continuous production.

The head then goes to the radial drill, etc. for finishing operations, and thence to the sub-assembly, on a trolley beam around the north end of the finished-parts storage.

Let us now return to the assembly line, following the order shown in Fig. 5. The different operations are so divided as to give about equal lengths to each.

At the first station the wheels are put on. At station 2 the V's are scraped. At station 3 the turret slide is put on, scraped to the V's, and the turret rescraped to the slide. At station 4 the cross-rails for the cross-sliding head are scraped, using special devices to bring them at right angles with and parallel to the V's.

At station 5 the oil pump and piping and the feed work are put in. Next the headstock is placed on the machine, and it is now complete. There are still, however, five stations remaining before reaching the department for equipment and final testing. Advantage is taken of this space to give the machines a final "run-in," which is done by belting them to motors overhead.

This running-in is opposite to the head assembly and is under the care of that group. Any difficulties or needed adjustments are taken care of here.

There is nothing special to be said about the department for equipment and final testing. The machines are mounted on their legs here, equipped with motors if required, and then with regular or special equipment as may have been ordered. Finally they are put through standard alignment and operative tests.

There are certain departments and operations not included in

this layout. Steel storage and cutting-off are taken care of in one department for the whole plant. So are casting, snagging, cleaning, and filling. These come before the parts arrive in the turret-lathe shop. After the machines leave the equipment and testing department they go to a painting, boxing, and shipping room common to all of the products.

Automatic-screw-machine products are taken care of in one department for the whole shop; and so, finally, is the hardening and heat treating. This latter operation is the only one making a break in the orderly flow of work through the shop.

#### ROUTING AND STOCK-ROOM CONTROL

The orders for parts are routed through this shop in a predetermined and effective course, but without any machinery of control. The rough- and finished-parts stock rooms are kept supplied with an adequate store of parts to prevent any hold-up in production, but there is no stockkeeper assigned to them; nor does this lack of special supervision result in unbalanced or undesirably large inventories or in unexpected shortages. These desirable features are

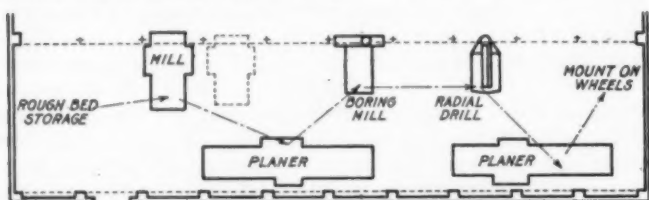

FIG. 6 LAYOUT OF DEPARTMENT FOR BED MACHINERY

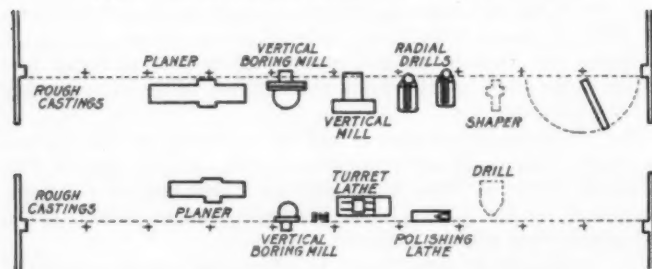

FIG. 7 LAYOUT OF DEPARTMENT FOR TURRET AND SADDLE MACHINERY

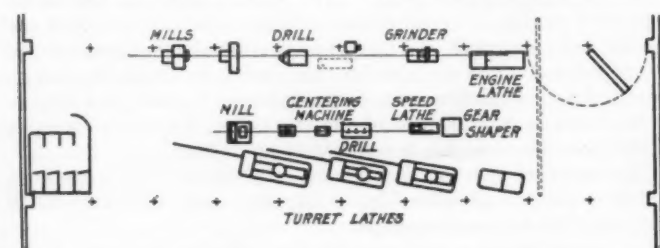

FIG. 8 LAYOUT OF DEPARTMENT FOR MACHINING APRON AND TURRET-SLIDE PARTS

attained by a "program" scheme of ordering and routing all parts except the main castings.

Each order is nominally of a sufficient size to furnish enough for a two-month's production. An order for a given part is thus placed in the shop every two months, or six times a year. The second period of the year (March and April) is an exact duplicate of January and February. A standard routing of all the parts passing through a given department may thus be laid out, from machine to machine, and duplicated for the next period and the next, and so on for the six periods of the year.

The routing was originally laid out on the basis of full production of five machines per day, on special sheets provided for this work. Fig. 12 shows sample pages from this routing book.

This standard routing is made upon the basis of our previous years of experience in speeds and feeds, and is arranged to put the orders through in the minimum time, with sufficient waits between operations to insure against trouble. All long waits, however, are eliminated, and with them the expensive items of storage space and idle capital for inactive stock. The ideal aimed at has been that

of a small, fast-flowing stream of work instead of a large, sluggish one. Further insurance against trouble is offered by reckoning on only about 80 per cent of the theoretical machine capacity. The margin takes care of breakdowns, breaking in new operators, poor stock, etc. There is the additional possibility of running overtime in an emergency.

The original laying out of the schedule is a matter of juggling, judgment, and experience. A successful solution implies a minimum of equipment, a minimum of floor area, a minimum inventory of work in process, a maximum rate of progress of the work, and

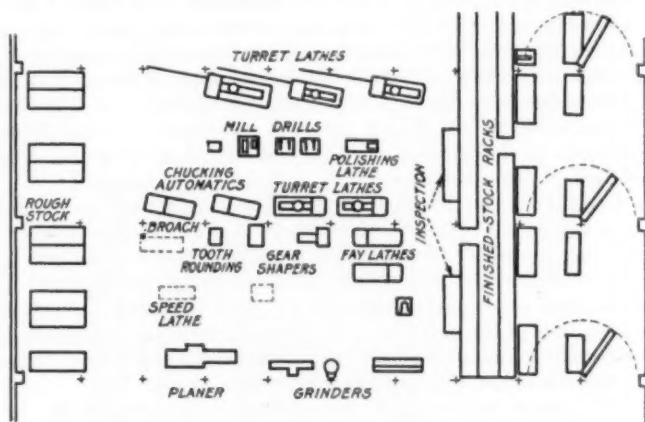

FIG. 9 LAYOUT OF DEPARTMENT FOR MACHINING FEED-WORKS PARTS

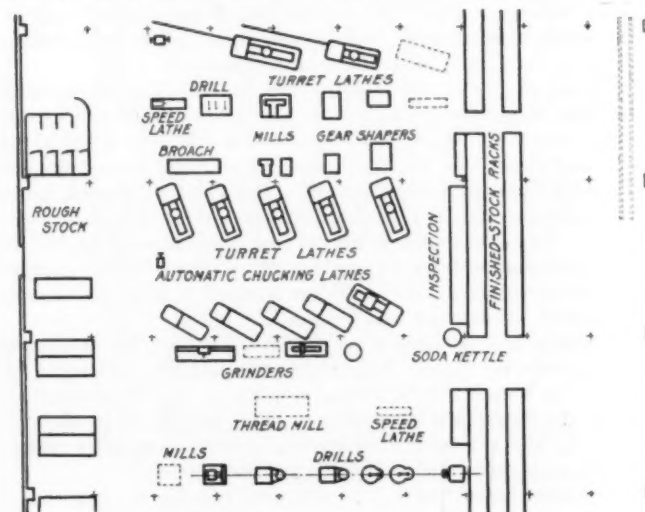

FIG. 10 LAYOUT OF HEAD-GEAR DEPARTMENT

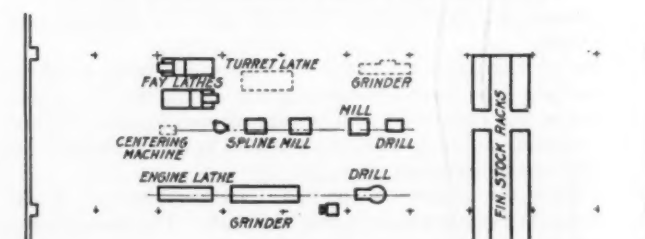

FIG. 11 LAYOUT OF SHAFT AND SPINDLE DEPARTMENT

a simple and easily comprehended standard of achievement for the department.

The finished routing schedule gives a starting date, repeated every two months, for each part. These starting dates, with other data, are recorded on a card shown in Fig. 13. If castings or forgings are required, the date on which they are to be ordered is also given, and on that date the foreman is held responsible for making a requisition on the purchasing department.

Note that a wide range of rates of production is provided for—from 3 to 30 per week. The rate of production is determined by

the general management, and the shop takes its information from the corresponding line on the card.

Now there is supposed to be carried in the rough-stock bins a full half-lot of castings or forgings in reserve. The first step of the foreman is to count this reserve stock. If it is below normal for the scheduled production, he adds to the normal order enough to make up the deficit. If it is above normal, he decreases his normal order by this amount.

This half-lot in reserve is insurance against trouble. It takes care of poor castings, delayed deliveries, spoiled work, etc. It is particularly important from the standpoint of starting the orders on time. If only half of a lot has arrived, it is still possible to put the work into the shop by drawing on this reserve. The *sine qua non* of this method of production control is starting on time. Nervous tension, frantic struggling, and despairing clutching at straws must be eliminated from the production schedule and concentrated on the problem of getting started on time.

The amount of rough stock ordered is thus determined by the scheduled rate of production and an actual count of the reserve supply. The finished-stock room is run on the same principle. When a new lot arrives in the stock room it is supposed to find a half-lot in reserve waiting there. At the earlier period of starting the lot there should be a correspondingly larger amount, and this amount is set down on the card. If the reserve stock is low, the foreman increases the normal lot to make up the deficit. If it is in excess, he correspondingly decreases his order.

There are no stock-room records. Both rough stock and finished stock get a complete count six times a year, and a better knowledge is obtained than is possible with all the chances for error in the clerical work of the perpetual inventory.

The stock is under continuous control. Orders go out from the main office to work on a production basis of 30 or 75 machines a month, or whatever it may be, and automatically the stock adjusts itself to this production. Change in scale of production is made easy by the provision of a reserve of half a lot in both rough stock and finished parts. The scheduled production on the card of Fig. 12 may be increased a step a month, or decreased at the same rate. If the proper changes in labor capacity are made to correspond, the adjustment of size of lots and size of stock takes place easily with the half-lot reserve as a balance wheel.

This is startlingly different from the old order of things with us, in which shortened production left us with a large stock, and increased production with an insufficient one. There is the accompanying financial advantage that the amount tied up in rough stock, work in process, and finished parts is automatically adjusted to the scale of production. It leaves for special decision only the major financial problem of how much shall be tied up in finished machines.

As there are no stock records there is no stockkeeper. The foreman of each department oversees the putting into and taking out of the rough stock. The inspector, located beside the stock room,

O. K.'s the finished work and places it in the proper bins. The bins are located opposite the point where the parts are finished and close to the point where they are assembled. One of the assembly men, detailed for the purpose, steps in and lays a group of parts on the top of the rack opposite the man who needs them when he needs them. It is possible to look down the aisle of the stock room twenty times and see a man in it only once.

#### THE DUTIES OF THE FOREMAN

This scheme of management is essentially a decentralized one. By keeping the work completely within the department from rough stock to finished stock, we avoid the necessity for detailed control of its movements, particularly with reference to interdepartmental relations. These are minimized, relating almost entirely to hardening operations. Roaming about the shop becomes unnecessary, the telephone falls into disuse, clerks disappear, and a hundred chances for confusion are dissolved.

The foreman is bounded only by his production orders and his schedule. Within these limits he is king of his territory, with full power given to him—and full responsibility demanded of him. His job is his own in a way that is never possible under the other plan of departmentalization and other schemes of management.

Mention was made of the fact that only about 80 per cent of full production per machine was reckoned with in laying out the schedule. This will ordinarily leave some idle time. When such idle time appears imminent on a machine, the foreman goes shop-

ping for work in the special or other departments. The service parts furnish convenient "knitting work." Since it is difficult to predict the call for repair parts, this branch of the business is handled in the old-fashioned way. The foreman can usually pick up something here to fill in his idle time.

He is provided, finally, with a definite yardstick with which to measure the efficiency of his department. The schedule requires a certain total number of hours for a given rate of output. If he requires more, he is not up to standard. If less, his management may be highly commended. In general, he will have to stick very closely to the definite routing prescribed by the schedule to maintain full production. On lessened production, with fewer men but a full complement of equipment, more latitude is allowed.

#### COST ACCOUNTING

There is little need for detail cost accounting. The cost of the machines can be determined sufficiently for price-setting purposes by reckoning on the overall operations of the shop—so much spent for steel, castings, forgings, etc. per month, so much for labor, and so much for overhead and fixed charges. This, divided by the output, gives a good cost per machine, because the department is run on an even basis. This simplified method of cost keeping is not the least of the advantages of this method of management; and the author believes it to be far more accurate—as well as far

FIG. 12 SAMPLE PAGE FROM ROUTING BOOK

less expensive—that the elaborate addition of the labor, material, and overhead for every one of the several hundred separate parts.

It should also be noted that the standard schedule presupposes standard costs with a given average labor rate and market cost of material. This standard cost derived from the standard schedule, set against the actual cost obtained as above, gives another gage of achievement.

#### METHODS OF WAGE PAYMENT

We are now working on a straight hourly-rate basis. The effectiveness of workmen and foremen can in general be gaged by their ability to keep to schedule, and their rate of pay can be adjusted accordingly. The plan would, however, seem to be adaptable to premium payment, and perhaps still more so to piece-work or bonus payment. It would seem to be especially suited to the group-bonus scheme, as the whole organization is divided up into small groups, each of which has a definite section of the work assigned to it and within its control.

#### RECAPITULATION OF PRINCIPLES

In the foregoing mass of details some of the principles involved are brought out clearly, others only incidentally. It may be well to recapitulate then here.

1 *Standardization of Product.* This is the first necessary step.

LIST NO. <u>7233</u> NO IN 2" <u>2</u> 3" <u>2</u> 2 <sup>5</sup> " <u>0</u>

FIG. 13 CARD USED IN ROUTING

It is the prime requirement of successful manufacture that a design of the product be settled upon which will give a wide market over a considerable period of years. This is the definite predetermined simplification of the problem which makes the solution possible.

2 *A Separate Manufacturing Equipment and Organization for the Product.*

3 *Departmentalization by Product Rather Than by Process.* There is nothing new in this. It is the plan of the high-production automobile shop. The novelty lies in adapting it to a low scale of production—in our case to an extreme low point of fifteen per month.

4 *A Recurrent Production Schedule or Program.* It is this feature which permits the adaptation to small production, and also makes possible the measurement of efficiency and the simplification in control and cost accounting.

5 *Concentration of Plant.* Principles 3 and 4 can operate to cut down machine and building investment for a given production, or to increase production for a given investment. It is worth while to decrease "the great open spaces" in a shop, if only to keep the work from taking root and going to seed in them.

6 *Minimized Transportation.*

7 *Disturbing and Difficult Factors Confined to Purchasing.* So far as possible, strenuous effort is made to have material ready to start on time. Then confusion is banished from the shop.

8 *Visual Control of the Work Itself, Instead of Remote Control by Records.* It is less than one hundred feet from raw material to finished machine. Within this short distance the work is to be found (except while being heat treated). It cannot escape. The foreman has it under his eye until it is assembled and rolls into the shipping room. In control by records some superexecutive functionary sits at a desk and pores over cards and slips of paper. A few hours of this and the eyes glaze and the judgment falters. It

is better to deal with things rather than with the records of things.

9 *Control by Orders Instead of by Records.* Records are always late. Direct the thing before it happens and save some tons of paper and miles of scribbling. And yet success in giving proper orders was only possible because we had kept records for years. Perhaps it is best to consider records as a necessary evil, to be discarded as soon as possible.

10 *Automatic Control of Inventories.* This is important. It is the very commonest of errors to put into inventories resources which belong in dividends.

11 *Cost Figures by Analyzing Total rather than by Totaling Innumerable Details.* Cheaper and surer.

12 *A Plain Job for Every Man and Full Responsibility with It.* A man can do more, and prove that he has done it, thus establishing a basis for increased earnings.

13 And lastly: *Don't Try to Overcome Difficulties—Avoid Them.*

#### ACKNOWLEDGMENTS

The general shop layout here described was devised by Mr. Henry S. Beal, assistant general manager of the Jones & Lamson Machine Company. The details of the machine arrangement and the arrangement of the production schedule are the work of Mr. Louis Hronek, assistant superintendent. Mr. George A. Perry, chief engineer, was responsible for the redesign of the product on which this method of manufacture is based, and for the mechanical details of the production scheme. Credit is also due to the personnel of the Fay lathe department, who tried out many of these methods under more difficult conditions.

#### Individual or Group Drive

ON VERY large work where it is cheaper to move the machine tools to the work than to move the work to the machine, individual drive is, of course, indicated. Any machine that takes 25 hp. to 50 hp. or more, and operates at a fairly uniform load not far from full load, particularly if the speed is high, should be considered for individual drive. In some special applications involving very frequent stops, starts, reversals, or speed variations, the controlling of which absorbs much of the operator's time, group drive is ruled out, due to the convenience of the electric control which makes possible a saving in time over mechanical control, and the fact that the clutches, brakes, etc., necessary to give a comparable operation would require more repair, or give decreased reliability.

In most discussions of this subject it is stated that the power consumed is much less with individual drive. From experience the difference has been more fancied than real. It is true that in the old days when an entire group of buildings was driven from one large engine with belts in tunnels from basement to basement, massive main shafting, bevel gears, or large quarter-turn belts to turn corners, and all the complication of old-time millwrighting, losses in power transmissions were ordinarily 30 per cent, and sometimes with poorly planned installations reached 50 per cent. With modern drives in groups of 7½ to 50, and occasionally (in case of heavy machines) 75 to 100 hp. a large number of tests made under the author's direction indicate an average loss including counter-shaft losses of 12½ per cent as ordinarily tested, with a probable actual loss in operation of 15 or 16 per cent. Of this loss only one-sixth was in the main lineshafting.

On the other hand, if there is much overtime work in the shop involving the operation of a very few machines in a room, for many hours per year, overtime, with a group drive, the corresponding lineshaft losses from operating the group lineshafting for a few machines may show a decided loss in power as compared with individual drive. Similarly in an industry which is highly but not completely seasonal, where through a part of the year only a few machines are operated, a similar condition arises.

In a large highly organized shop where the inventory of work in progress is kept at a minimum to reduce investment in unfinished product, and where, therefore, a manufacturing delay of a few hours, or a day or two, in one part of the plant will throw many other departments out of step, reliability of motive power frequently outweighs considerations of first cost or power loss.—From an article in *Industry Illustrated*, September, 1924, p. 48.

# The Manufacture of Gasoline by the Cracking of Heavier Oils

By C. M. JOHNSON,<sup>1</sup> SHREVEPORT, LA.

*The increasing demand for gasoline and the fact that much of the supply of crude petroleum is unsuited to the production of motor fuels have led to the development of numerous processes for "cracking" or decomposing low-grade natural crude oils and the heavier fractions of refinable crudes and thereby increasing the yields of the lighter hydrocarbons. In this paper the author first discusses the principles of cracking and then presents a classification and comparison of the various processes employed for that purpose, pointing out their relative advantages and disadvantages. Following this he describes twelve processes which are in commercial use in the United States, giving dimensions of apparatus as well as data on temperatures and pressures employed, quantities of raw-oil charges, percentages of gasoline obtained, etc.*

ALTHOUGH petroleum is widely distributed and although information as to its occurrence and general characteristics seems to have existed from very early times, our knowledge of the chemical nature of this substance has been acquired largely within the past forty years. Within this period a voluminous literature has accumulated which records work as painstaking as has ever been undertaken in the whole field of chemistry, but the commercial method of treating crude petroleum is still essentially empirical. Much knowledge has been acquired as to methods of separating commercial products from crude petroleum, but little has been done to attain the maximum recovery of such products.

The increasing number of motor vehicles in operation, both in the United States and abroad, has brought about a demand for motor fuel which, if it continues to increase at the present rate, will soon far exceed present production by ordinary means. Moreover a large proportion of the world's output of crude petroleum is of such a character as to produce by ordinary refining methods comparatively little gasoline and naphtha. The result is that the demand for these lighter fractions must be supplied by the types of crude petroleum generally classed as "Refinable Crudes." But refinable crudes are capable of yielding, by the usual refinery operating methods, only fractions of their total volumes as gasoline and naphtha.

From time to time the bringing in of a prolific oil field relieves the strain, but the relief is only temporary, as the life of a gusher field is generally short. The discovery of new fields, which is daily becoming more difficult, can hardly furnish a solution of the problem of meeting the ever-increasing demand for crude petroleum. Even if crude oil could be obtained in sufficient quantity to meet the needs of the gasoline market, an excess supply of less desirable products would be bound to result.

The fact that such a large proportion of the supply of crude petroleum is unsuited to the production of motor fuels, has led to investigations of commercial processes whereby yields of these products from a given quantity of refinable oil could be largely increased. It is obvious that if such processes can be successfully developed, the result will be better than if the production of crude oil is proportionately increased. The supply of crude oil will be conserved, and the market will not be burdened with products of limited or unprofitable commercial use. These processes involve "cracking" or decomposition of heavy oils—either low-grade natural crudes or the heavier fractions of refinable crudes—that have at present a low commercial value.

## THE PRINCIPLES OF CRACKING

Cracking is at present in an early stage of its development and an enormous mass of experimental work has evolved only a few commercially complete processes. The result of subjecting hydrocarbon mixtures to heat and pressure, which is called "cracking," or destructive distillation, and which increases the yields of the lighter hydrocarbons, was accidentally discovered as early as 1861

in the operation of a still at Newark, N. J. As originally employed, the process was directed toward the conversion of that fraction of crude petroleum intermediate between the burning (kerosene) oils and the lubricating oils into liquid hydrocarbon products of lower density and boiling point which would be suitable for use as illuminants.

The ordinary processes of refining crude petroleum yield a series of products differing widely in properties and commercial desirability. Those required for the smaller types of internal-combustion engines, such as are now generally used in airplanes, motor boats, and automotive vehicles, are in greater demand. Kerosene and fuel oil, which are used to produce light, heat, or power, are less desirable both with regard to commercial profit and to the conservation of natural resources.

Of the two types of products used in internal-combustion engines—lubricants and gasoline—the former does not yet constitute a problem in the conservation of resources. But the production of gasoline on the present scale threatens to bring about the practical exhaustion of the country's underground supply of crude petroleum. There is no more important problem facing the industry today than that of conservation of this natural resource.

The conversion of all kerosene and fuel oil into gasoline is neither desirable nor possible, nevertheless the proportionate production of volatile distillates from crude petroleum should be increased. The most important means of accomplishing this end is the wider use of "cracking processes."

The cracking process is simply one instance of the well-known tendency of organic substances to decompose on the application of heat. The heavier the hydrocarbon molecule, the more easily it is dissociated (separated). In actual fact, cracking is the rule rather than the exception in the majority of distillation processes involving other than low temperatures.

A natural hydrocarbon oil, or crude petroleum, is a mixture of substances of varying boiling points. Each of the hydrocarbons of high boiling point contained in such mixtures is, during the process of distillation, exposed to various degrees of temperature beyond its own boiling point, so long as the hydrocarbons of lighter gravity and boiling point are not removed from the still. Consequently the liquid hydrocarbons of high boiling point may remain exposed in the still to temperatures below their boiling point for a number of hours. For example, in general refinery practice one to three days is necessary to complete a crude cycle, the exact period depending on the size of the still and the amount of hydrocarbons to be treated. This long exposure to a temperature below the boiling point of a particular hydrocarbon, resulting in its dissociation or partial alteration, constitutes "cracking." As time is an important factor in every organic reaction, the technical significance of the time the oil is exposed to heat becomes evident.

In the cracking of heavy oils two factors largely govern the course of the reactions that take place, namely, temperature and pressure. The function of increased temperature is to break the bonds of groups that make up the complex hydrocarbon molecule. In many processes pressure is of chief importance in controlling the temperature of distillation, but it also exerts an influence on the nature of the decomposition produced.

The temperature at which dissociation takes place with the desired rapidity is usually above the boiling point of the hydrocarbon concerned. When no pressure is employed these hydrocarbons will vaporize and pass out of the reacting sphere, the degree of alteration being small. If, however, sufficient pressure is employed to raise the boiling point to a temperature causing more rapid cracking, alteration into the desired product may be obtained with a minimum of total decomposition. As soon as the action begins to be a total decomposition, permanent gases will be evolved and both carbon and heavy asphaltic bodies will remain as residues. The volume of gas, therefore, if measured, is an approximate index of the degree of decomposition that is taking place. The cracking

<sup>1</sup> Chief Engineer, Invincible Oil Co. Mem. A.S.M.E.

Presented at a meeting of the Mid-Continent Section of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS, Tulsa, Okla., October 11, 1923.

process therefore involves a partial alteration or dissociation, as distinguished from a more complete alteration or decomposition. The object of cracking is to alter the heavier molecules so that low-boiling hydrocarbons will be produced that would not appear on ordinary distillation. Such a process may or may not be accompanied by an appreciable production of permanent gases, depending on the degree of alteration necessary to obtain the desired products. In a simple cracking process as high a temperature as is practicable within the limits of apparatus is desirable, in order to insure a high speed of reactions. A decrease in temperature below a given point will mean a decided increase in time. In commercial practice this would mean increase in operating costs. On the other hand, too high a temperature will mean a large production of extreme decomposition products, so that for results commercially desirable a mean temperature must be chosen that will cause the process to be completed at the maximum speed consistent with a relatively small production of permanent gases and carbon.

The object of any process must be to produce the maximum amount of a commercially desirable product at the lowest commensurate cost. The cracking process produces a mixture of various hydrocarbons which, to be available commercially, must have an initial boiling point not over 140 deg. Fahr. and an end point not over 450 deg. Fahr. with a gravity range of 50 to 58 deg. B. The product must be water white in color, sweet in odor, and stable in its composition. The use of heat and pressure for cracking is an old art and is not the subject of any existing basic patents. When combined with condensation under pressure it is subject to many patents, of which No. 1,049,667, issued to William Burton on January 7, 1913, and No. 1,123,502, issued to J. A. Dubbs on January 5, 1915, are the earliest of present importance still in general use. These patent claims conflict, as they are—to a certain extent—basic and of primary importance. The validity of the Dubbs patent, the application for which antedated that made by Burton, is now in litigation between the Universal Oil Products Corporation and The Standard Oil Company of Indiana.

#### CLASSIFICATION AND COMPARISON OF CRACKING PROCESSES

Cracking plants may be considered as employing the following three general methods:

- 1 Subjecting liquid to both heat and pressure
- 2 Subjecting vapors to heat with or without pressure
- 3 Heating liquid or vapor in the presence of a catalyst.

Roy Cross, in his Bulletin No. 16 of the Kansas City Testing Laboratory, classifies the various cracking systems as follows:

##### I—VAPOR PHASE

###### A—Atmospheric Pressure

- 1 High Temperatures (Pintsch gas)
- 2 Low Temperatures.

###### B—Increased Pressures

- 1 High Temperatures (Rittman)
- 2 Low Temperatures.

##### II—LIQUID PHASE

###### A—With Distillation (Distillation necessary)

- 1 Atmospheric Pressure
  - (a) Without chemicals
  - (b) With chemicals.
- 2 Above Atmospheric Pressure (no differential pressures):  
Dewar and Redwood, Dubbs, Burton, Clark, Jenkins, Fleming
- 3 Very High Pressure (distilling at a reduced pressure).

###### B—Without Distillation (necessarily high pressure)

- 1 Intermittent
- 2 Continuous
  - (a) Identical heating and reaction zones
  - (b) Separated heating and reaction zones.

This outline of the general systems of cracking gasoline is not based upon any general mechanical arrangement. However, most of the patents relating to the cracking of oil cover mechanical arrangement.

Those systems that heat the oil vapor at atmospheric pressure are principally used for making gas. On account of the low specific heat of the oil vapor the temperatures are very high and are not subject to exact control. The pioneering work in the cracking of oil was done in heating in the vapor phase under increased pressure.

The really successful processes that have proved profitable are those in which the cracking is accomplished by applying the heat to the liquid phase of the oil.

The method by which a large proportion of the synthetic gasoline is now made is by distillation at pressures considerably above the atmospheric pressure. The reaction and distillation take place in the same still. A great deal of refluxing is necessary and the gasoline must be removed as fast as it is formed. An enormous amount of heat is lost by reason of this refluxing and the reaction is considerably retarded, but nevertheless the distillation is a necessity as otherwise excessive pressures would develop. By the use of very high pressure more reaction can be accomplished in a shorter time, and methods exist whereby this is done, followed by distillation at a lower temperature.

All processes of making gasoline which have not involved the treatment of the oil strictly in the liquid phase are said to have met with only a questionable degree of success. Cracking processes are as yet in the primary stages of commercial application. As a means of supplying the products most in demand their importance can hardly be overestimated. It only remains to discover the most efficient means of obtaining the maximum possible yield of the desired product from any particular oil. The ease and cheapness with which crude petroleum can be transported to regions lacking supplies of crude oil give particular value to cracking processes, as the cheapest and most readily obtainable oils may be subjected to cracking at the place of the greatest demand and most extensive use.

There has been considerable prejudice against the products of cracking processes. It is claimed that burning oils are inferior in light-giving power and more easily acquire a dark color with age. The chief objection seems to be the presence of the unsaturated hydrocarbon compounds which give an unpleasant odor and require the use of large quantities of sulphuric acid in the refining process, which increases the cost of the finished product. The same prejudice seems to exist with respect to the cracked gasoline. Another objection to cracked gasoline is the alleged fact that such gasolines deposit larger quantities of soot in the cylinders of internal-combustion engines, but this deposit may or may not be caused by improper mixtures for proper and complete combustion. Certain investigations tend to show that a properly cracked gasoline gives a greater mileage than a straight-run gasoline, because of a slower-burning quality that gives power during the entire piston stroke as compared with the explosion occurring with straight distillates.

There is therefore reason to believe that instead of being inferior, the cracked gasolines are really superior for use in automobile engines as regards both mileage and power obtainable even though they lack some desirable properties, and this suggests that a blend of "cracked" gasolines and the straight-run gasolines may give greatly improved results.

The pressure-distillation (liquid phase) type of cracking process is the one that seems to have been developed most extensively to date, and at present is the only one that is a factor of real commercial importance in the production of gasoline. Cracking by distillation without pressure is old and has been in use for years for the production of kerosene from heavier petroleum products. It was early discovered, by accident, it is said, that vigorously fired stills, constructed with plenty of surface for reflux condensation, were capable of cracking heavy hydrocarbons into distillates which were largely of the volatility range required for burning oils. The pressure-distillation process was developed when gasoline instead of kerosene became the product most desired. The difficulties involved in its development and operation were considerably greater than those that must have been encountered in the cracking distillation of kerosene; and the development of the Burton process is one of the important scientific achievements of the present day.

The other common type of thermal process is the so-called "vapor phase" process, in which oil is cracked by passage through some sort of system, generally a tubular one, that is strongly heated. Whether the oil is completely vaporized previous to cracking during its passage through the heated zone is questionable, but as regards chemical behavior this type has characteristics indicating a single-phase or vapor-phase system. In the distillation type of process there is for each oil a relation between temperature and pressure. With the vapor-phase processes the two conditions of temperature and pressure can be fixed independently of each other

and of the physical properties of the oil cracked, which, according to the phase rule, makes it possible to regard the cracking zone as a single-phase or vapor-phase system.

Vapor-phase processes have been developed along commercial lines, with a number of modifications, but they seem to differ chiefly in mechanical and operating details, the fundamental principles seemingly being the same. In a broad, general way they consist in passing a stream of oil through the heated zone of the system, this heated zone being maintained at a temperature high enough to bring about the desired degree of conversion. These processes practically always operate under pressure, although this is not an absolute essential as it is for pressure-distillation processes. The temperatures usually measured are those of the cracked product leaving the heated zone, and the figures generally specified in claims or descriptions are between 500 deg. cent. (932 deg. fahr.) and 600 deg. cent. (1112 deg. fahr.).

As regards chemical action in vapor-phase processes, it appears that the gasoline formed by cracking is not removed continuously but remains with the uncracked oil during its entire course through the cracking furnace. This results in the exposure of the gasoline to cracking conditions for an appreciable interval of time after its formation, and gives an opportunity for re-cracking and consequent formation of permanent gas. On this account, as well as on account of the fact that the temperatures are undoubtedly higher than those effective in the pressure-distillation type of process, the amount of gas formed per unit quantity of gasoline produced is higher in the vapor-phase than in the liquid-phase processes.

The pressure-distillation process is one that seems decidedly advantageous as to chemical kinetics. The temperatures maintained in the body of liquid oil are relatively low. The temperature of the metal surfaces that transmit heat to the oil is undoubtedly considerably higher, but the results of the process warrant considering it as operating at a relatively low temperature. The desired product, gasoline, is removed from the cracking zone practically as soon as it is formed. The gasoline is volatile under the temperature and pressure conditions maintained in the still and passes promptly into the vapor line. These conditions of low temperature and prompt removal of gasoline vapors favor a high yield of volatile liquid hydrocarbons with a minimum formation of those undesirable products—carbon and permanent gas.

While the cracking of oils in the vapor phase would be highly desirable if the product in other conditions were satisfactory, the advantages of cracking in the liquid phase are many and are overlooked by investigators working in the vapor phase. Some of these advantages are as follows:

- A lower temperature is sufficient to induce cracking

- A higher yield of refined gasoline is obtained

- There is a better economy of heat. (The thermal efficiency may be successfully compared with the generation of steam from water on one hand and the superheating of steam on the other; it being a very expensive operation to heat a vapor through a metal)

- A more perfect control of temperature. Carbon deposits always in suspension.

The disadvantages chiefly concern operating conditions and sum up as follows:

- A large amount of oil exposed to the heat in case of ruptures of the still

- Inability to use light distillates such as kerosene without using high pressures.

On the other hand, some of the advantages of cracking in the vapor phase are:

- The small amount of oil exposed to heat in the event of breakage resulting in a fire

- The possibility of varying pressure and temperature independently of each other, enabling the vapor-phase plant to crack successfully light distillates such as kerosene.

The disadvantages may be summed up as follows:

- A majority of the processes operating in this phase are handicapped by the high temperature at which cracking elements must be maintained, which, combined with pressure causes rupture of parts

- Formation of carbon on mechanical scrapers or stirrers which ultimately close the tubes

Overheating of the atoms as they come in actual contact with the wall of the tube, which causes decomposition, forming a permanent gas and carbon.

The difficulties of heating a gas or a vapor in a metal container are well known and require no comment other than the fact that it is an expensive operation.

While the past decade has seen an enormous amount of research and invention, the present finds but few processes which may safely be designated as established processes. A conclusion which is soon reached is that no matter how promising a process may appear in the beginning, only extended plant operation determines its commercial success. The operation of the pressure still is approaching something like standard practice in many refineries, but even there has its limitations.

A brief description of some of the cracking systems now in use in the United States follows:

#### THE BURTON PROCESS

Burton's first patent, No. 1,049,667, was granted January 7, 1913, and the process is extensively used at the present time by the various Standard Oil companies. The development of this process marks one of the milestones in the history of petroleum refining and its originator merits the distinction of being the first to demonstrate that pressure distillation could be done safely and practically on a large scale. The Burton system, with its several modifications, uses the liquid-phase method, heating the gas oil or fuel oil in shell stills (Burton) or in Heine-type boiler stills (Clark), using a thermosiphon circulating system and condensing the vapors under 4 to 5 atmospheres pressure. These systems have considerable carbon troubles, but the results obtained are the standard of comparison in the art.

#### THE BURTON-CLARK PROCESS

The Burton-Clark still is rated at 210,000 gal. per month or approximately 165 bbl. per day. A typical modified Burton still consists of a horizontal steel shell 10 ft. in diameter by 30 ft. long with forty-five 4-in.-diameter tubes suspended by front and rear headers, very similar to the arrangements of a water-tube boiler. The slope of the tubes is such that circulation is by thermosiphon and the carbon formed is removed from the heating zone and deposited in the shell. The tubes are exposed to the hot furnace gases while the shell itself is protected. Eight-inch vapor lines convey the vapors to aerial condensers which contain approximately 400 ft. of 4-in. pipe. From these aerial condensers the vapors pass through a vapor heat interchanger to the water-cooled condenser coils and thence to a receiving drum in the tail house. Here the condensed vapors settle, partially filling the drum to a desired point. The uncondensed vapors collect under pressure in the upper part of the drum and through proper control valves are conveyed through high-pressure or low-pressure mains to the gasoline recovery plants or to fuel. The light distillate removed from the bottom of the drum is metered and passes on to the run tanks.

Raw oil entering the system is metered and is pumped through the vapor heat interchanger and vapor lines to the still. The reflux from the aerial condensers also returns to the still through the vapor lines. The entire system operates under 75 to 85 lb. pressure and all controls are located within the tail house, which is usually set above the condenser boxes.

The cycle is usually about 72 hours and it is claimed that 60 to 70 per cent of light distillate is obtained overhead, from which 50 per cent of gasoline is secured. The residuum or pressure tar is removed at the end of the run and used for fuel. The carbon averages between 150 and 300 lb. per run and is removed manually.

The Standard Oil Company of Indiana controls these patents and licenses their use to responsible refiners on the basis of 0.4 cent per gal. of oil charged, or about 16.8 cents per bbl. They also stipulate that one-third of the total production of gasoline from their apparatus be subject to their call upon 60 days' notice.

#### THE DUBBS SYSTEM

The Dubbs system, assigned to the Universal Oil Products Corporation, the first patent of any importance being No. 1,123,502, dated January 5, 1919, operates in the liquid phase. It has certain advantageous features, but appears to be only one of the many pos-

sible forms of utilizing the same basic principles, the relative efficiencies of which are matters of perfection of engineering design and construction. Properly developed, it should give results comparable with other systems of the same general class.

The 500-bbl. units which are considered standard plants consist of heating elements, expansion chambers, a dephlegmator, and condensing and cooling elements, together with an accumulator tank and pumping equipment. The heating elements consist of fifty 4-in. by 30-ft. No. 4 gage seamless drawn tubes connected at the ends by special return bends and forming a continuous coil 1500 ft. long containing approximately 1500 sq. ft. of heating surface. These tubes are set within a brick setting with a separate combustion chamber fired at each end. The combustion gases pass over a partition wall, thence downward over the tubes to the flue and stack. The expansion chamber is a 10-ft. diameter by 10-ft. high hammer-welded steel shell supported by a cast-steel ring set upon a concrete platform. This drum is heavily insulated to prevent excessive losses of heat by radiation. The dephlegmator is an upright steel cylinder approximately 3 ft. in diameter by 12 ft. high, supported by a structural-steel framing and is set about 90 ft. high to the top of the tower. The condensing elements are contained within a steel condenser box supported upon the roof of the control house. The control house is a concrete and brick structure housing the charging and transfer pumps together with the necessary indicating and recording instruments. The residuum cooling coils are set within a steel condenser box resting upon the ground at some convenient point. Pipe, valves, and fittings are designed to withstand the temperatures and pressures at which the system operates.

Raw oil from the storage tanks is pumped through the heating coils, entering at the bottom and flowing upward in countercurrent with the gases of combustion. The heated oil, at about 120 to 160 lb. pressure and 750 to 850 deg. Fahr. temperature, flows to the expansion chamber, entering at the top. In this chamber the vapors are released, passing on over to the dephlegmator. The carbon or coke builds upon the bottom of the chamber and the heavy residual fuel oil is continually withdrawn from above the level of the coke. The vapors enter the dephlegmator at the bottom, passing upward, around, and over a series of baffle plates where the heavier ends condense and reenter the system. The light vapors leave the tower at the top and pass through the condensing and cooling coils to an accumulator tank where the pressure is relieved and the pressure distillate passes on to the receiving tanks. The fixed gases are removed from the accumulator and may be passed through a compression or absorption system to secure an additional yield of gasoline and afterward be used for fuel. These gases usually amount to around  $1\frac{1}{2}$  to 3 per cent of the raw oil charged and contain 0.5 gal. of gasoline per 1000 cu. ft.

The vapors leaving the dephlegmator are controlled to the desired temperature by charging overhead a portion of the pressure distillate produced. This charge enters the top of the tower and falls downward in countercurrent to the ascending vapors from the expansion chamber. This liquid cools the vapors and causes the heavier fractions to reflux into the system and at the same time the vapors impart sufficient heat to vaporize the distillate. This constant refluxing and circulating secures a pressure distillate of desired quantity and quality. Varying the quantity and rate of raw input will affect the percentage of gasoline yield, a large input securing a lesser yield than a small input. This refluxing really amounts to recycling of the residual products. There is little or no carbon formed within the heating elements because of the continuous removal of the heavy fuel oil and the deposit of carbon in the expansion chambers. The relatively large amount of reflux, as compared with raw input, preheats the raw oil. Of the 500 bbl. of raw input, 60 to 70 per cent may pass out as pressure distillate and 38 to 27 per cent as fuel oil, while 2 to 3 per cent remains as carbon.

Before the beginning of a run, chains are suspended and coiled with the expansion chamber. At the end of the run these chains assist in the breaking up of the coke deposit, thus affecting the time required in cleaning the receptacle. The length of a run depends entirely upon the amount of carbon formed within the chamber. When running on topped crude oil the cycle usually runs from 5 to 6 days, and 12 to 13 lb. of coke is formed per barrel of raw oil. When running on gas oil this cycle varies from 5 to 15 days, depending entirely upon the quality of oil.

The fuel consumption appears high, ranging from 6 to 12 per cent of the throughput, but the results obtained seem to justify this item of expense.

The Dubbs patents are owned and controlled by the Universal Oil Products Company, of Chicago, Ill. The company charges a royalty of 15 cents per bbl. of 42 gal. for oil subjected to treatment under the license.

#### THE GREENSTREET SYSTEM

Greenstreet's first patent No. 16,452 was granted in England in 1912. By this method the oil vapors are subjected to heat while traversing tubes in the presence of steam. The oil to be treated is first forced through preheating coils so arranged in the furnace that high temperatures in the liquid are not secured; steam is then added and the mixed oil and steam then enter the cracking coils, where the vapors are subjected to the most severe temperature conditions. From the cracking zone the products leave the coils and enter expansion drums, one of which serves each cracking coil in the furnace. These tanks have the double purpose of equalizing pressures and of continuing the cracking of the oil. Leaving the expanding drums, the lighter vapors are reduced in pressure before they enter the condenser. The heavier products are drawn off from the bottom of the expanding drums. The pressure on the apparatus varies according to the nature of the oils run.

The apparatus consists of a furnace in which there are placed six or more long flat coils of 2-in. tubing, each coil having a continuous length of 425 ft. These coils are suspended from steel beams at the top of the furnace in a way that facilitates easy removal and replacement. The wide range of liquids this system will handle makes it attractive to the refiner. It is merely necessary to adjust the pressure, temperature, and rate of feed of steam and oil to get a variety of results and enable the refiner to manufacture products for which at the time there is the greatest demand. It is claimed that when the conditions of speed, pressure, and sufficient steam are properly coordinated, there is never any carbon formed in the coils.

#### THE HALL PROCESS

Although developed by an American, this process was first tried on a commercial scale in the British Isles, being used throughout the war for the production of benzol and toluol from gas oils. In this country the Texas Company has been interested in the process and has done considerable research. The apparatus in a broad way resembles Greenstreet's, but has a fundamental difference of operation in that steam is not used. The oil traverses the coil and is gradually heated until the most severe conditions are encountered at the outlet when the pressure is reduced to near atmospheric, the speed of the vapors reaching 5000 to 6000 ft. per min. From the expanding drums the vapors pass through a series of dephlegmating towers, where several products of ranging boiling point are removed, and finally to a compressor where the vapors are compressed and then cooled. Each coil is composed of 600 ft. of 1-in. inside-diameter tubing.

#### THE RITTMAN PROCESS

Nearly every one is familiar with the principles of this method, and a detailed description is unnecessary. Suffice to say that cracking takes place in the vapor phase in an upright tube. The method consists essentially in suddenly gasifying the material to be treated by atomizing into the top of the tube, cracking the gasified material in the absence of any liquid and under a pressure of at least six atmospheres. The vapors and tar are taken off separately from the tar pot at the bottom of the tube. Carbon is removed from the sides of the tube in the cracking zone by mechanical means.

This system is strictly a one-phase system and as the pressure may be held constant and the temperatures varied, or vice versa, it is more elastic in its possibilities than any two-phase process.

#### THE ALUMINUM CHLORIDE PROCESS

Perhaps the most conspicuous developments under the aluminum chloride process have been carried out by the Gulf Refining Company under the direction of Dr. A. M. McAfee. The oil is heated and stirred in a still in the presence of anhydrous aluminum chloride or other anhydrous salt of aluminum. Before treatment, the oil must be freed from water, and a quantity of the catalyst equal to a

maximum of 8 per cent by weight of the oil charged is added before distillation is begun. Fractionating towers are interposed between the still and the condenser so that the higher-boiling-point vapors may be returned to the still along with the aluminum chloride which has been vaporized and carried over. The distillation is continued slowly at a temperature of 500 to 550 deg. Fahr. over a period of 24 to 48 hours. By this method a yield of 15 per cent or more may be obtained from residual oils. At the end of the distillation it is found that the aluminum chloride is enclosed in granular coke—which is easily removed—and that a heavy oil free from asphalt may be separated from the coke and then utilized for the production of high-grade lubricating oils, the recovery of paraffin wax, or the manufacture of petrolatums. The distillate secured is water white and of pleasant odor, and in order to secure finished gasoline it is only necessary to wash with dilute alkali and water. The one difficulty suggesting itself as being inherent in this process is that of recovering the aluminum chloride or of manufacturing it cheaply. It is claimed that the products secured by cracking in the presence of catalysts are superior to those obtained by heat-cracking processes.

#### THE CROSS CRACKING SYSTEM

The Cross units are rated at 500 bbl. per day and consist of heating elements, a reaction chamber, and condensing and cooling apparatus, together with an accumulator tank and necessary pumping units.

The heating elements consist of two banks of tubes, the upper of preheating tubes and the lower of cracking tubes. Each bank consists of twenty-eight 4-in. inside- and 5-in. outside-diameter seamless drawn tubes 20 ft. long, connected at the ends by cast-steel return bends and forming continuous coils. The cracking tubes are placed in the brick setting directly above the combustion arch, and the preheating coils are arranged directly above them so as to absorb heat from the flue gases. The reaction chamber, as now designed, is a gun-forged steel cylinder of 38 in. inside and 44 in. outside diameter, 40 ft. long. The ends are swaged down to a smaller diameter than the body of the chamber. All apparatus is built to withstand a working pressure of 600 lb. and temperatures up to 860 deg. Fahr.

The raw oil is first pumped through the preheating coils, entering at the top and flowing downward to the cracking tubes. No decomposition or cracking takes place in this bank of tubes, since they merely serve as fuel economizers. The preheated oil enters the cracking tubes at the bottom and flows upward to the reaction chamber. The main absorption of heat takes place in this bank of tubes while the pressure in the system is sufficient to maintain the oil in the liquid condition. The temperature and the character of the oil under treatment govern the rate of feed. The oil flows from the cracking coils to the reaction chamber where it is held a sufficient length of time to establish an equilibrium between the liquid and vapor phase—usually about fifteen minutes. A control valve is set at a predetermined liquid level and the oil passes out through the condensing and cooling coils under a pressure of approximately 40 lb. into the accumulator tank from which the gas is removed and used for fuel while the synthetic crude passes on to storage. This crude is then run in the ordinary skimming plant in the conventional manner. During the interval of time for conversion, the carbon is dropped out in the reaction chamber and builds up on the bottom. In general practice 96 per cent of the raw oil passes on through the system to synthetic crude and 4 per cent is carbon, fixed gases, and loss. Sufficient gas is generated within the system to provide fuel for the entire cracking operation. Reducing the synthetic crude usually yields 28 to 29 per cent of gasoline, and if the residual gas oil from this operation were re-cracked, additional yields of gasoline would be possible. Figured on original gas oil, the first run and one recycle yield approximately 43 per cent, and a second recycle increases the yield to 51 per cent.

This process has a distinct advantage in its ability to crack successfully kerosene distillates; it can also handle fuel oils, although the running time is materially shortened because of the deposition of carbon in the reaction chamber, which is of limited capacity.

Tower stills are being added to the cracking units and it is claimed that the heat contained within the synthetic crude is sufficient to cause distillation, securing the benzene overhead and leaving a

gas-oil residuum. The usual cycle when operating on gas oil is 150 to 175 hours.

This system is controlled by the Gasoline Products Company, of New York and Kansas City, and is licensed to refiners for 10 cents per bbl. of raw oil charged. The company has a working agreement with the Texas Company and is negotiating an agreement with the Standard Oil Company of New Jersey and the Standard Oil Company of Indiana whereby an interchange of patent rights on various processes might be of some value to a licensee.

#### THE FLEMING CRACKING PROCESS

The 200-bbl. units which are considered standard plants consist of an upright steel shell, a dephlegmator, jet condenser, residuum cooling coils, and the necessary pumping equipment.

The still is a hammer-welded steel shell 10 ft. in diameter by 30 ft. high, made of 1-in. steel with heads 1 1/8 in. thick. This shell rests upon a cast-steel ring which is supported by a concrete platform. This platform also carries a radial-brick setting surrounding the still which tapers toward the top and terminates in a steel breeching and stack. Heat is generated through four burners set at equal distances around the circumference, and that portion of the steel shell directly opposite to the flames is protected by a light wall of firebrick. The upper five or six feet of the still projects through the setting and breeching and is heavily insulated. Inspection holes are located at convenient places for examining the shell. The dephlegmator consists of an upright steel cylinder 3 ft. in diameter by 12 ft. high, which is supported by structural-steel framing about 53 ft. to the top of the tower.

The still is first charged with 300 bbl. of raw oil, which is gradually heated until the distillates come over. Raw stock is then charged over the top of the tower at a rate of approximately 250 to 275 gal. per hr., receiving a preheating from direct contact with the vapors. At the same time the heavy fractions are knocked down and only the lightest vapors pass over the condensing and cooling apparatus. The preheated raw oil plus the reflux enters the still at the bottom and percolates through the body of oil in the still. To assist clean cutting by a positive control of temperature of the outgoing vapors, a certain amount of the reflux is cooled and pumped back over the top of the tower.

The overhead vapors which leave the dephlegmator are condensed in an apparatus of the jet type. The arrangement is such that a needle-type valve releases the vapor between two cones of water. It is stated that the still pressure is maintained up to the needle valve, but that in the throat of the condenser itself there is no pressure—in fact, that there is a slight vacuum. The combined water and condensate is discharged into a separating tank where the water is drawn off and the fixed gases removed to be used as fuel.

The losses compare favorably with other processes and demonstrate the fact that there is no appreciable absorption of the gas by the water. The scrubbing effect of the water is also valuable, aiding materially in cleaning up the distillate and thus reducing later treatment.

The average cycle, including cleaning, is between 60 and 80 hours, depending entirely upon the quality of raw oil fed into the apparatus. At the end of the run there is sufficient latent heat within the still to distill over between 100 and 150 bbl. of gas oil, leaving a fuel oil of desired viscosity and gravity.

This system is controlled by the M. W. Kellogg Company, of Jersey City, N. J., who are the sole manufacturers, erectors, and selling agents. The company charges \$20,000 per still as a royalty, to be paid in two years. After this payment is made the licensee has no further assessments to pay.

#### THE JENKINS PROCESS

The Jenkins Petroleum Process Company, with headquarters in Chicago, Ill., owns and controls the following United States Letters Patent:

No.	Patentee	Date of Issue
1,226,526	U. S. Jenkins	May 15, 1917
1,321,749	U. S. Jenkins	November 11, 1919
1,239,423	A. D. Smith	September 4, 1917
1,247,883	Stephen Schwartz	November 27, 1917
1,295,223	A. D. Smith	February 25, 1919
1,324,075	A. D. Smith	December 9, 1919
1,374,402	A. D. Smith	April 21, 1921

and various other modifications and improvements which have not as yet been published. The outstanding feature in the Jenkins system is the complete internal circulation of the entire liquid mass in treatment by mechanical means within the unit.

The Jenkins patented cracking still is built very much on the order of the Heine-type water-tube boilers and is at the present time constructed by the Blaw-Knox Company of Pittsburgh, Pa. The main drum is a hammer-welded steel shell 72 in. in diameter by 35 ft. long made of  $\frac{7}{8}$ -in. steel plate, the ends being closed with dished heads  $\frac{15}{16}$  in. thick. The rear water leg is 36 in. in diameter and the front water leg 40 in., both made of 1-in. plate and flanged at the ends for field riveting to the main and transverse drums. The transverse drums at the bottom of the water legs are made of hammer-welded steel 1 in. thick, and are 6 ft. in inside diameter by 10 ft. long; the ends are closed by dished heads  $1\frac{1}{8}$  in. thick.

Manheads in the main drum are located in the center of the rear head and in the top of the shell directly above the front water leg. Each transverse drum is also provided with a manhead located in the center of a head—right or left hand as required. The manhead in the top shell is 18 in. in diameter, while the remainder are 24 in.

The transverse drums are connected by 130  $3\frac{1}{2}$ -in. No. 8 gage Shelby, seamless, drawn, calorized tubes about 17 ft. long, which are rolled, prossered, and beaded into the flue sheets. These tubes are set 7 in. on centers and are staggered. (At the American Gasoline Plant the stills are provided with 226 3-in. tubes about 16 ft. long which are set 23 rows wide by 10 rows high.)

The stills are designed and constructed entirely in accordance with The American Society of Mechanical Engineers' boiler code. They are designed for a working pressure of 150 lb. per sq. in. and 750 deg. Fahr. temperature. After erection and before the settings are erected each still is subjected to a hydrostatic test of 225 lb. per sq. in. at 125 deg. Fahr.

For batch-charging and pumping-out purposes there is provided a 4-in. connection in the head of the rear transverse drum located directly under the manhead. In the center of the opposite head there is a 3-in. nozzle used for draining the drum, also for a steam connection. In the top of the main drum, about four feet from the rear head, is an 8-in. nozzle used for the vapor-line connections. Six feet in front of the vapor nozzle and on the center line of the rear water leg is a 12-in. nozzle which supports the propeller-driving mechanism. A 4-in. nozzle located near the front end of the shell is used for the pressure relief valve. On the center line of the rear head and alongside of the manhead is a 3-in. nozzle used for the continuous removal of the fuel oil. The front head is provided with openings for gage glass, pyrometer, and steam lines.

The stills are set independently of the brickwork and are carried by three steel stirrups supported by structural-steel framing. This framing also serves to support the operating superstructure.

The brick settings are so designed and constructed that only the tubes are subjected to the gases of combustion, the front and rear water legs, transverse drums, and main shell being protected by brickwork.

A cast-steel propeller of proper diameter and pitch is used to maintain a positive circulation of the liquid within the still, thus securing a very efficient transfer of heat through the tubes from the gases of combustion of the liquid. This propeller is at the present time being driven by a 30- or 50-hp. constant-speed motor directly connected with the shaft. Plans are being prepared to substitute a steam-driven unit in place of the motor in order to secure the flexibility of varying speeds. The propeller-driving mechanism is housed within a steel-frame, corrugated-iron building supported by the structural-steel still framing. A small steel-frame, corrugated-iron shed is built over the front head of the main drum to house the pyrometers, pressure gages, and gage glasses. Steel walkways and stairways provide easy access to all operating points.

An 8-in. extra heavy O. S. and Y. gate valve, fitted with a  $1\frac{1}{2}$ -in. bypass, is bolted to the still nozzle. The vapor line terminates in a tower 60 in. in diameter by 16 ft. high which is supported on framing above the condenser box. This tower was built by the Kansas City Structural Steel Company and consists of three drums each 60 in. in diameter by about 4 ft. high, which are connected by two groups of 120 tubes 2 in. in diameter by 2 ft. long. Vapors from the top section are conveyed through conventional condensing and cooling coils to the receiving house.

These stills are first charged with 150 to 155 bbl. of oil, which is gradually brought up to the proper temperature and pressure, this usually requiring about seven hours. The 8-in. valve on the still vapor nozzle is closed during this portion of the operation and the  $1\frac{1}{2}$ -in. bypass is used to control the pressure within the system. During the next 92 hours raw oil is fed into the still at an approximate rate of 25 to 30 bbl. per hour. Two hours are then required for pumping out and six hours for steaming and cooling down. The cleaners then enter the drums and remove the accumulation of carbon. The tubes are cleaned out by means of air-driven flue cleaners, this cleaning operation consuming about fourteen hours. Thus the entire operation sums up about as follows:

Charge, 150 to 155 bbl.	
Feed, 25 to 30 bbl. per hr. (600-750 bbl. per day)	
Fire to over.....	7
Over to off.....	92
Pumping out.....	2
Cooling and steaming.....	6
Cleaning and heading up.....	14
Charging.....	2
Total.....	123

This cycle of 123 hours is an average operation at the American Plant and does not represent a maximum, as this depends entirely upon quality of raw feed.

The vapors released through the bypass are conveyed through an 8-in. vapor line into the lower chamber of the tower, passing upward through a group of tubes into the second section of the tower, and then through another group of tubes into the top section of the tower. A heavy cut is removed from the lower section and an intermediate cut from the center section which are rerun in fire stills yielding benzene overhead with gas-oil bottoms. (This gas oil forms a recycle stock.) The light cut overhead from the rerun operations is combined with the light cut taken from the upper section of the tower and treated, then steam stillled, yielding finished gasoline overhead with kerosene-distillate bottoms.

The fixed gas is trapped out of the system in the receiving house and by means of a small blower is forced through a water drum to a gas holder and to burners under the boilers. The water drum serves to clean the gas and remove the hydrogen sulphide, although primarily designed to prevent a flashback through the lines. The fuel oil containing the carbon—about seven per cent of the charge—is continuously removed from the still from a "quiet zone" at the rear end of the main drum.

#### THE COAST-CODSEN SYSTEM

The Coast stills are rated at 150 to 160 bbl. of gas oil per day. The still consists of a horizontal steel shell 8 ft. in diameter by 40 ft. in length, set within common brick settings. The fire sheet is kept free of carbon by a rocker-arm movement which drags a series of chains across the bottom of the still, thus keeping the carbon in suspension. Vapors are conveyed through three shell-and-tube-type aerial condensers or horizontal reflux towers to the control house, where the pressure is released and the vapors condensed at atmospheric pressure.

The initial charge of the still is 250 bbl. of gas oil, which is raised to an operating temperature of 750 deg. Fahr. The pressure within the still is raised to 80 lb. per sq. in.

As the vapors pass through the towers 90 per cent is condensed and refluxed into the still to be cracked further. Uncondensed vapors are released from pressure in the receiving house by means of a valve, after which they pass into the condenser.

The pressure in the still is shown by a gage at the pressure relief valve in the receiving house. A thermometer at the same point shows the temperature of the still. Regulation of the pressure is accomplished by increasing or decreasing the flow of still vapors through the pressure relief valve to the condenser box.

After leaving the condenser the pressure benzene passes through a gas and water separator and then through a meter where the amount is carefully checked. Another meter in the receiving house records the amount of gas oil being pumped into the still through the preheater, and the two meters are synchronized so that the level of fluid in the still will not vary in height.

The gas oil pumped through the preheater is raised to between

300 to 350 deg. Fahr. before it reaches the still. This effects a considerable saving in fuel as well as reducing strains on the still which would be caused by the introduction of cold liquid.

During the cycle 150 bbl. of gas oil are pumped into the still, which brings the total oil treated to 400 bbl. The cycle is 60 hours, making the still capacity approximately 160 bbl. per day of 24 hours. The 60-hour cycle consists of 52 hours running time, 7½ hours charging, cooling and steaming, and ½ hour cleaning.

Of the gas oil charged, approximately 70 per cent goes over as pressure distillate during the cycle, 26 per cent remains as fuel oil, and the still loss is around 4 per cent. Treatment of the pressure distillate before steam stilling causes a loss of 2 per cent of the distillate.

It is claimed that, based on actual operations over a considerable period, the distillate yields 61.2 per cent gasoline, 7.2 per cent kerosene, 30.6 per cent fuel oil, and a loss of 0.9 per cent, which, figured back on the gas oil charged, shows:

- 40 per cent 56 deg. B. 437 E. P. gasoline
- 7 per cent 42 deg. B. water-white kerosene
- 47 per cent 22 deg. B. fuel oil
- 6 per cent loss.

The yields as given are those obtained from the first cycle on gas oil. The average fuel consumption is given as 9 per cent of the total charge to the still.

The process is being offered for sale and installed exclusively by the F. W. Freeborn Engineering Corporation, of Tulsa, Okla. The royalty charged is ½ cent per gal. on gasoline produced.

### THE ISOM SYSTEM

The Isom system, U. S. Patent No. 1,285,200, as adopted by the Sinclair Refining Company, operates at 100 to 125 lb. pressure and at temperatures rarely exceeding 750 deg. Fahr. The Isom stills have charging capacity of 235 bbl. of raw gas oil and operate at a rating of approximately 1200 bbl. per day. The heating elements consist of fifty 4-in. tubes fitted with Foster superheater rings containing 2700 sq. ft. of heating surface, while the oil is heated over 900 sq. ft. of tube surface. The oil is circulated through these heating elements which are arranged vertically in the furnace by means of a Connersville 14- by 28-in. two-lobe hot-oil pump to and from a horizontal still 9 ft. in diameter by 32 ft. long. The vapors released in this still are conveyed through a reflux tower 60-in. in diameter by 28 ft. high. The system is charged continuously during the cycle by pumping the raw oil over the top of the tower. Vapors are condensed under pressure, and the regulating valves for the continuous draw-off as well as for the condensates are located in the receiving house.

The stills are operated on a 48-hour cycle: 30 hours of continuous running and 18 hours for starting up, cooling down, and cleaning. Depending upon the rate of charge and how hard the heaters are fired the following results are obtained: 500 to 800 bbl. of 49.8 deg. B. distillate received overhead, and 500 to 800 bbl. of 24.0 deg. B. pressure tar drawn off per run of 30 hours.

Under normal operating conditions, 50 per cent of the continuous-charged gas oil comes over as distillate, 45 per cent of the continuous charged gas oil is drawn off as tar, and 7 per cent of the continuous charged gas oil is loss and carbon.

## Simpson's Rules Generalized

By W. F. DURAND,<sup>1</sup> STANFORD UNIVERSITY, CAL.

**S**IMPSON'S rules (so called) for finding areas bounded by an irregular curve have long been a part of the every-day working material of the engineer.

Those best known and most employed are presumably the so-called "one-third" and "one-twelfth" rules. The former gives any area *OABC* as in Fig. 1, in terms of the three ordinates,  $y_1$ ,  $y_2$ ,  $y_3$ , and the common interval  $h$ . This rule is

$$A = \frac{h}{3} (y_1 + 4y_2 + y_3) \dots \dots \dots [1]$$

or in symbolic form,

$$A = \frac{1}{3} (1 + 4 + 1) \dots \dots \dots [2]$$

The latter or one-twelfth rule gives any area *EDBC*, Fig. 2, likewise in terms of the three ordinates  $y_1$ ,  $y_2$ ,  $y_3$ , and the interval  $h$ . This rule is

$$A = \frac{h}{12} (5y_3 + 8y_2 - y_1) \dots \dots \dots [3]$$

or in symbolic form,

$$A = \frac{1}{12} (5 + 8 - 1) \dots \dots \dots [4]$$

Now these rules, and in fact all such rules generally, presuppose a uniform value of the interval  $h$ —an equal spacing of the ordinates. In some cases, however, the known information, represented by the ordinates, presents itself at irregular or unequal spacings. In such cases these rules cannot be applied.

For these reasons it has seem desirable to develop forms of rules covering cases such as those in Figs. 1 and 2, but with the two intervals unequal in value.

It should perhaps be noted at this point that the unit of area in these diagrams, consisting as it does of two intervals and three

ordinates, develops out of the assumption that the actual irregular curved boundary is replaced by a series of second-degree parabolic arcs, each such arc spanning two intervals and thus comprising three ordinates. A second-degree parabolic curve may of course be passed through any three points and may thus be made to fit any three ordinates, and vice versa any three ordinates will serve to determine a parabolic arc of the second degree.

The problem then becomes one of finding the area under a parabolic arc of the second degree such as *AB* in Fig. 1, and bounded by the two end ordinates  $y_1$  and  $y_3$ , and of then expressing this area in terms of the three ordinates  $y_1$ ,  $y_2$ ,  $y_3$ —all under the general assumption that the two intervals may have any values  $h$  and  $k$  instead of the same value  $h$ .

For present purposes we may omit the mathematical details and give simply the results. For those who may be interested in such details, an outline of the process is given later in a supplementary note.

Referring to Fig. 3, we may write the resultant rule as follows:

$$A = \frac{h+k}{6hk} \left[ (2h-k)ky_1 + (h+k)^2y_2 + (2k-h)hy_3 \right] \dots [5]$$

In Fig. 3, as shown, the axis is turned vertically and the ordinates  $y$  are laid horizontally. This permits the convenient placing of the multiples against each ordinate. This with the outside factor  $(h+k)/6hk$  will give then the area as desired.

It will be readily seen that if  $h = k$ , the rule in its simple form in [1] results.

An interesting case develops when  $k = 2h$ . In this case the multiplier for  $y_1$  becomes zero and the parabolic area is correctly determined in terms of the two ordinates  $y_2$  and  $y_3$ . Those interested in the properties of the parabola will find the examination of this point a pleasant exercise.

Turning next to Fig. 4, we have

$$A = \frac{k}{6h(h+k)} \left[ h(3h+2k)y_3 + (h+k)(3h+k)y_2 - k^2y_1 \right] \dots [6]$$

This gives the hatched area between  $y_2$  and  $y_3$ . A symmetrical

<sup>1</sup> Professor of Mechanical Engineering, Stanford University. President-Elect A.S.M.E.

formula for the area between  $y_1$  and  $y_2$  is of course readily written if desired.

Through the repetition of rule [5] and, if necessary, combination with [6], an area of any extent and with any number of ordinates spaced in any manner whatsoever may be determined with the degree of accuracy characteristic of the parabolic arc as a substitute for the actual curved boundary.

A third case sometimes arises as indicated in Fig. 5. In this case the ordinates  $y_1, y_2, y_3$  are known, with intervals  $h$  and  $k$  for example. It is then desired to extend the integration or the measurement of area so as to include a farther ordinate  $AB$ , not known as to value,

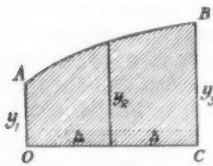

FIG. 1

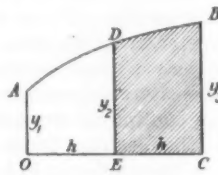

FIG. 2

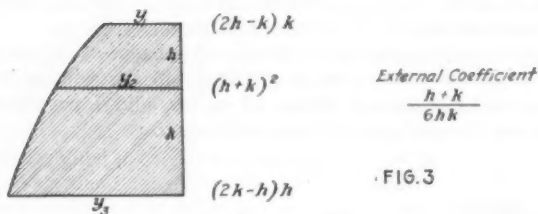

FIG. 3

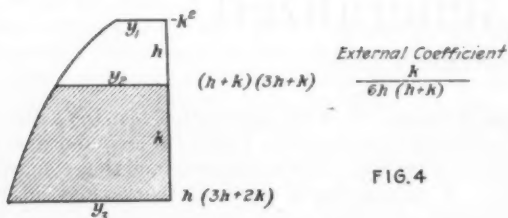

FIG. 4

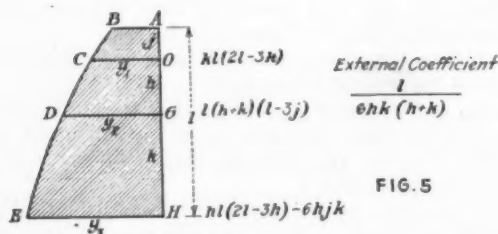

FIG. 5

but on the assumption that the parabolic arc  $CDE$  is extended to cut this ordinate. That is,  $BCDE$  is assumed to be a single parabolic arc of the second degree, as fixed by the three ordinates  $y_1, y_2, y_3$ , and then the entire area  $ABEH$  is desired.

The result in this case is as indicated in Fig. 5. These values are readily simplified to the case where  $h = k$ .

If in the formula of Fig. 5  $j = 0$ , the values take the form of those for Fig. 5, as of course they should; and if furthermore  $h = k$ , they reduce to the usual form of Equation [1].

#### SUPPLEMENTARY NOTE

The foregoing formulas are readily derived by employing the following procedure:

The general equation of the parabolic arc is taken in the form

$$y = ax^2 + bx + c$$

For  $x$ , then, we may substitute successively 0,  $h$ , and  $(h+k)$ , thus giving  $y_1, y_2$ , and  $y_3$ .

The area of such a curve between the limits 0 and  $(h+k)$  is then found by integrating  $ydx$  and putting in the limits. This area will contain the coefficients  $a, b, c$ . Next these values  $a, b, c$  are found from the values of  $y_1, y_2, y_3$  by considering them as three simultaneous equations in  $a, b, c$ . This gives values of  $a, b, c$  in terms of  $y_1, y_2, y_3, h$ , and  $k$ . The value of the area will be in terms of  $a, b, c, h$ , and  $k$ . Then substitute in this value for the area the values of  $a, b, c$  in terms of  $y_1, y_2, y_3$ , and the result will give the area in terms of  $y_1, y_2, y_3, h$ , and  $k$ , which is the end sought.

## The Engineer in City Activities<sup>1</sup>

IN OUR modern transportation, especially the automobile, we are facing an element in city planning quite as important as the passing of the city walls. Our cities have no boundaries. With a motor car, a half-hour's ride from the city means many miles. Little farms and the lure of the country are attracting many. No one will question the healthfulness and desirability of the movement. Certain features of it suggest the need of more fundamental study of the city's resources. Is the city, from the point of view of organization, legal authority and community spirit, advantageously equipped to solve its new problems?

Our problems of traffic and housing are far from being solved. These two questions, such an important part of the daily cycle, are intimately connected with the efficiency and contentment of the productive workers who really make the city.

Within this great human dynamo, this industrial city, we have the governmental city, caring for the common needs and common interests of its inhabitants. The city's legal authority, its power to do, comes from a recognition of its special fitness to supply these needs.

That some such legal mechanism is necessary may be seen at once if we recollect how greatly the city's functions have increased in the last 300 years. The city of that time had no general system of sewers or water supply. Municipal lighting was a very limited affair. Systematic public school education, public libraries, and public health service were then unknown. The public service corporation was in its infancy. The development of these multitudinous functions has meant the solution of a problem with three phases a technical, a legal, and a financial program. Any suggestion for improvement must consider all these aspects.

If the development of the city were simply adding a few more units as one would add cases to a filing system, the various programs would all be simple. But the technical problem is far more complex. Take the well-known example of city water supply. The per capita consumption of a city of a million inhabitants is generally three times that of a city of a hundred thousand. The water has to be carried three times as far in the larger city, with the result that the per capita investment will be four or five times as great. A similar increase will be observed in the cost of sanitary systems, lighting, and other utilities.

The growing value of suburban property is due to the growth of the city. The city creates this value and then helps to maintain it. City taxes make large contributions to the "unearned increment" of the real-estate speculator. Yet the legal control of the city over the subdivision has been almost negligible, and voluntary planning in the interest of the city is rarely known.

An example of desirable extension of the city's power might be given in the application of zoning, not only to the area within its boundaries but without. In practically all of the great European municipalities, the government has entire control of its water front. The city has a vital interest in this low-lying land. It must look after the general health of those who inhabit it. It must also provide the trunk sewers and the pumping stations to keep it drained. Low-lying lands should be converted into parks, and not be permitted for residential use.

Another reason for the control and restriction of subdivisions is the fact that after initial improvements are accepted the city must maintain the subdivision. The familiar sign "sewer, water, sidewalks, and cinderized roads" means no guarantee as to quality. Often the work is so poorly done as to be useless in a few years—a sheer and total economic loss. An engineer's uniform specification adopted by the state as a whole would be a valuable remedy.

Let us study what was done in expanding the medieval cities of Europe. Their solutions of the engineering, legal, and financial problems of city planning furnish many and valuable precedents. Let us, as engineers and architects, familiarize ourselves with these data, so that in place of simply waiting to be told, we may play the part of leaders, educators, and constructive thinkers and by our united efforts make a real contribution to the city's growth.

# The Design of Ordnance Matériel

## Procedure to be Followed in Designing Ordnance Matériel for Economical, Interchangeable Mass Production

By J. D. PEDERSEN,<sup>1</sup> SPRINGFIELD, MASS.

THE considerations in the design of ordnance matériel are essentially the same as those proper in the design of any mechanism of similar class whose volume of production is likely to warrant the most advanced and complete manufacturing equipment. Interchangeability of component parts, when produced by proper equipment, insures a better and a cheaper mechanism than one whose components are non-interchangeable.

In ordnance matériel, for example a machine gun or an infantry rifle, all the advantages of interchangeability are now accentuated and demanded. It is indeed fortunate that the manufacturing equipment best adapted for mass production is also the best means of securing interchangeability of components.

To attain mass production readily and at low cost, the proper manufacturing design of the components to be produced is of vital importance. With such a design, good methods and machining equipment and correct limit gages are required to secure interchangeability and volume production.

Ability to manufacture requires an organization of men and machines. In the epoch of non-limit gages from which industry is emerging, more time was required to train the personnel than was used to design, build, and provide the mechanical equipment for a new product. And the training could not start until the mechanical equipment was ready.

When non-limit gages are used, fair but not interchangeable components can be produced. Training, skill, and good judgment are necessary to make the product even "close" to such gages. Due to the former prevalence of the "Yankee mechanic" and his excellent judgment, fair results could be obtained after a colony of workmen who had become skilled in its product grew up around a plant.

The "Yankee mechanic," however, is passing, and his place is being taken by workmen of lower ability and less zeal. On the other hand, the general trend of development in mechanism is toward greater intricacy, which imposes ever greater demands for accuracy of production.

Reconciliation of these opposed conditions, to permit progress, can only lie in perfecting our technique and the complete use of limit gages. Limit gaging not only requires a minimum of skill and judgment on the part of the factory personnel, but enables a result to be accomplished not otherwise attainable. When applied to the manufacture of components whose tolerances have been correctly analyzed and determined, production quickly resolves itself into fairly simple routine.

In the design of ordnance matériel no pains should be spared to reduce the manufacturing possibilities to the forms best and most quickly obtainable. War comes suddenly and catches us without an adequate supply—in instances with little more than models—of the weapons we contemplate using. Contracts are let in vast numbers. Factories are improvised and special manufacturing equipment started. Organizations are hurriedly augmented, necessarily with a large portion of labor and superintendence totally ignorant of the product to be made. Then is no time to deliberate on *what* to make. Action is demanded. Zeal too frequently is substituted for ability. The whole nation is crying for guns, at once.

### A PICTURE TYPICAL OF PRODUCTION DURING THE GREAT WAR

At the present time full benefit is not generally obtained from the use of limit gages and our other means of mass production, except by a few advanced organizations. This may be exemplified by a picture typical of production during the Great War.

A factory has received production orders and component drawings of the mechanism desired. One or more models illuminate

these drawings. The models function well in themselves, and their parts may readily interchange from one to the other.

Upon measuring the components of the models it is found that in many particulars they do not agree with the drawings nor among themselves. Frequently the drawings may carry tolerances not easily procurable under production methods. Attempt is made to reconcile the models and drawings and to finally establish manufacturing limits. The correct tolerances are easily enough applied in the case of simple male and female engagements, also in the case of surfaces requiring only an "atmospheric fit." In the attempt to follow through the tolerance accumulations in a functional train involving several components we begin to bog down: too many seemingly conflicting conditions. Accumulated variations mount up alarmingly in places, and many tolerances are set which later prove to be impossible of ready attainment. Or attainable tolerances may arbitrarily be set which later do not produce interchangeability.

Many tolerances are set at "round table" conferences. The inventor groans if a variation of more than one one-thousandth of an inch is suggested, while the milling-department foreman is made happy by a tolerance of a thirty-second of an inch. Somehow the tolerances are finally set, component drawings brought up to date, and the special equipment of fixtures, gages, and cutting tools designed and built. So far, in spite of many small difficulties, all has seemed fairly clear sailing, and hope is strong that the imminent production schedule will be met.

As the special equipment becomes available, the fixtures are set up on their belted machines and tried out. Many fixtures and gages have to be sent back to the tool room for correction. Certain operations will not produce to gage. These require changes to improve. Certain others will produce to gage only by careful nursing of the operation. "Let's go—we must meet the production schedule." Finally all the machine operations are ready and a few of each of the components are delivered to the assembling department.

Our troubles are about to begin. Certain parts will not assemble without being changed—investigation shows an affected surface to be outside its gage limits. Certain other components will not assemble, although everywhere within their gage limits. Or a few guns may assemble without fitting, but not satisfactorily perform the required functions. Apprehension justly arises that the components have not been correctly specified. The main office seems to be cruelly insistent about guns in the shipping cases.

We now begin to realize the import of the word "trouble." A detachment of "trouble shooters" is hastily organized, many suggestions considered—some adopted—and changes to equipment are started. The production schedule has already been badly bent, but hope still lingers that by extra effort we can yet swing in with the final quota. The necessity of frequent "explainings" to the main office does not add to our peace of mind and ability to secure results. Yet important decisions have to be made as to the continuing or stopping of machining operations. Continuing may accumulate a mass of useless components. Stopping may unduly delay progress and result in no components for the assembling department to practice upon. During the "tuning up" stage, machining on certain components may be stopped and started several times.

In time the components carrying the newly adopted changes come to the assembling. In general the original troubles seem settled. But new ones crop out in unexpected places, some as unanticipated results of previous changes. The necessities of still more changes develop from time to time and these are made. Matters are improving, however, as one by one the troubles are run down.

After much travail it is one day realized that tentative assembling can be started. This soon grows into "guns in the warehouse"

<sup>1</sup> U. S. Armory.

Contributed by the Machine Shop Section of the A.S.M.E. and presented at the Machine-Tool Meeting, New Haven, Conn., Sept. 15-18, 1924.

in increasing numbers. But many months have passed and an entirely new schedule must be set up if we are to retain any hope of hitting it. During the course of the entire production troubles frequently arise, but we now have at hand those who have become proficient in tracing and solving the troubles to which this particular mechanism seems subject.

Several factories may have had contracts for the mechanism whose production is pictured. Each factory has had its own special troubles and very frequently its own solution. Eventually the product of one plant became differentiated from that of another.

Many of those who have been actors in the above picture have concluded that approximately the travail described is inseparable from getting production under way. A thorough survey, however, after participating in a number of such pictures, indicates otherwise. The net result of all the necessary changes shown in the picture was finally the adoption of attainable tolerances with limits adjusted to secure interchangeability.

Groping in the dark of cut-and-try methods is very tedious, costly, and inconclusive.

#### TROUBLES AND DELAYS AVOIDED BY INITIAL PROPER DESIGN OF COMPONENTS

Nearly all of the troubles and delays at the start of and during the course of production may be avoided by initial proper design of the components to be made. The possibility of such design has been amply demonstrated.

Most plants are not engaged in the continuous launching of new models. Their engineering organizations are consequently reduced to those necessary to handle production routine, upkeep, etc. An engineering organization capable of correctly analyzing and determining proper manufacturing design and of designing correct production equipment for a new model can rarely be improvised. Months are required to develop such an organization.

It would seem that the service of analyzing a manufacturing design, as well as a proper equipment design to produce the same, could advantageously be supplied by a concern whose business is that of building gages and special tools. Continuous engagement would permit the development of an able engineering corps along the lines of consistent progress. The effect of a few organizations of this nature would soon become apparent and they would do much to improve our industrial position when brought into competition with reviving European industry based on cheaper labor.

A mechanism of the class discussed contains from 100 to 300 component parts, all but one or two of which are of steel, frequently alloy or high-carbon steel. The components are machined from forgings or from the solid bar, and many of them receive heat treatment. There are no unmachined surfaces. In the infantry rifle about 1500 distinct operations, 700 of them being machining operations, are required for its various components. The machine gun requires many hundred distinct machining operations. To control each machining operation one or more limit working gages is necessary. A similar set of gages bearing the adopted limits should be used to inspect every machine operation on substantially every component. Many surfaces are formed by second or finishing operations.

The majority of machining operations consist of milling; next drilling and reaming. Profiling, slotting, shaving, boring, turning, grinding and screw-machine operations are frequent.

To maintain the factory discipline necessary to secure interchangeability and easy mass production, all work must be rigidly inspected. Any component not entirely within its gage limits should be rejected. The tolerances adopted for each operation, therefore, must be readily attainable with the equipment when operated by the class of workmen available during war-time production. Such tolerances only will permit the fair rejection of any work which may be outside its gage limits.

#### TOLERANCES ATTAINABLE BETWEEN PROPER LOCATING POINTS AND A GIVEN SURFACE TO BE MACHINED

Experience in volume production of the class under discussion has suggested the following attainable tolerances between proper locating points and the surface considered:

	Tolerance, inches
When surface is formed by milling, profiling, slotting, or shaving..	0.008
With slightly more care.....	0.006
With second or finishing operation.....	0.004
Finishing a small, simple spot.....	0.002
Surface grinding on magnetic chuck.....	0.003
Greater care and use of revolving chuck.....	0.002
(Close parallelism can be secured by the latter method.)	
Axial position of fairly short jigged holes.....	0.002
With refined equipment and skill.....	0.0005
Position of end of milling cut when procured by ordinary "knock off" of power feed.....	0.030
End of milling or shaving cut if hand fed against stop.....	0.006
Hand fed with skill against special stop.....	0.003
Position of shoulders or ends of holes dependent upon ordinary spindle stops.....	0.015
With greater care.....	0.006
Skill with special stops.....	0.002
In the case of generated sizes dependent upon the cutting tool being moved to a stop, such as turning, boring and center grinding, in diameter.....	0.006
With some care, in diameter.....	0.004
With skill and refined equipment, in diameter.....	0.002
Grinding short pieces with skill, in diameter.....	0.001
In the case of sizes dependent upon the dimensions of the cutting tool these tolerances are readily attainable: width of slots formed by milling, shaving, etc.....	0.008
If second cut.....	0.004
If second cut and tool frequently changed.....	0.002
Diameter of fairly short holes or stems if drilled or hollow milled....	0.004
Single-reamed or box tooled.....	0.002
Second-reamed or box tooled.....	0.001
Second-reamed, with skill. (As for locating holes or for driving fit).	0.0006
Diameter of long holes such as in rifle barrel, where several reamings are done.....	0.0015
Special care, with some selection.....	0.0006
Diameter of rifling grooves.....	0.003
With special care.....	0.0015

The above list of tolerances procurable by various methods will serve as a guide. Special conditions in certain operations may require departures. Experience has shown that ordinarily little will be gained by the adoption of tolerances much in excess of those suggested at the larger end of the range. Too great tolerances breed carelessness in production. Cost begins to mount increasingly as the smaller end of the range is specified.

#### REQUIREMENTS OF TOLERANCES FOR MASS PRODUCTION

Tolerances for mass production are required to cover the legitimate variations demanded by the following:

- Lack of rigidity in belted machine, even in good condition
- Spring in cutting tool or arbor
- Adjustment of cutting tool with respect to position and shape or size of tool

- Variation due to minute clearance between components, locating holes and their locating pins on machining fixture.

Other variations caused by undue spring of cutter, improper locating points on component, faulty design of machining fixture, etc. are not legitimate variations and should be avoided by proper methods and correctly designed equipment.

As part of its final design each component should be adapted to be located in its standard machining fixture. With few exceptions the best location is obtained by a plane locating surface on the component. Two holes of ample size and of accurate spacing and diameter are carried in and normal to the locating surface. If the component does not functionally require such a plane surface and holes, these locating points should be introduced upon it for machining purposes. The objectionable portions of the locating points would be removed by a final operation.

#### ESSENTIAL ELEMENTS OF BEST MACHINING FIXTURE

The essential elements of the best machining fixture consist of a locating plate carrying two locating pins and mounted on the non-movable part of the fixture. The plate is provided with repairable raised contact spots. The component is moved, in parallel, on to the locating pins to contact with locating plate, by a movable jaw driven preferably by a quick-action locking cam which holds the work immovably under the cutter. Opening of the jaw draws

the work, in parallel, off the pins. Stops approximately position the work laid in the open jaw in such a manner that a simple closing of the jaw perfects the correct location of the component.

In this type of fixture it is to be noted that the component is automatically positioned correctly in the second and third planes by the locating pins, and that the most favorable conditions are provided to correctly position it in the first plane. The chances of error in location are thereby reduced to less than one-eighth the chances existing where the workman must exercise his own care to insure correct positioning in all three planes. The best results cannot be expected from the time-honored practice of hammering down the work into a vise.

In providing manufacturing equipment the fixture adopted as standard for each component can be built to the required number on a small manufacturing basis. This frequently reduces the cost below that incurred by building a variety of fixtures for a given component, even though this variety may at first seem expedient. A type or standard fixture for each component also permits a greater concentration of attention to details in fixture design. Position gages may also be designed along the lines of a type for each component.

Reference blocks should be provided for the setting and easy checking of the gages required for each operation. Given proper design of the components, production possibility is based upon the integrity of the gages. Both working and inspection gages are subject to wear, according to conditions. A periodic gage inspection of ample frequency should be made a rigid part of production routine. The system of gage checking based upon the use of accurately made model parts has proven unfeasible. The finished model components frequently do not carry their locating points and in addition are too much subject to distortion. Many of the reference blocks can be advantageously provided by accurately forming, on an unfinished component, the surfaces of the desired machine operations.

Upon the manufacturing design of ordnance matériel of the class discussed will depend not only its excellence of performance but its capabilities of being produced in large quantities by mass-production methods in a number of independent plants. Clearly the final designer of the component parts of the mechanism must have at his fingers' tips a thorough knowledge of the best methods of machining, fixturing, and gaging appropriate for each machine operation. Without previous detailed experience in mass production, the designer cannot bring to bear a proper knowledge and decision upon the subject.

In the proper design of ordnance matériel or similar mechanism, no pains should be spared to arrange the surfaces of the components for easy machining and gaging. A limit analysis is useless which contemplates the setting of unattainable tolerances with the methods specified. Full benefit from our present knowledge of limit gaging, work holding, and machining can only be attained when these are applied to the mass production of a design which is correctly based upon these methods.

Let it be assumed that mass-production equipment is ordered for the manufacture of a weapon just adopted. One or more properly functioning models are available, also probably the drawings to which these models were made. As the combination of inventor and production designer in one individual is so highly unusual, the usual models will merely show that functioning is possible with components of the dimensions contained in such models. These models must therefore be considered as being merely a successful laboratory experiment, upon which are based hopes of mass production of similar mechanisms which will perform the functions demonstrated by these models.

#### ANALYSIS OF POSSIBLE EFFECTS OF ACCUMULATIONS OF THE TOLERANCES DEMANDED BY MASS-PRODUCTION METHODS

We are now at a stage whose importance is all too frequently not realized. That the component parts in the models properly function, proves only that they will do so in the few models in which they may have been tried. This carries no proof that component parts made with the variations demanded by mass-production methods will correctly assemble in all combinations, to perform the intended functions. Such proof can be had only by a mathematical analysis of the possible effects of accumulations of the tolerances demanded by mass-production methods.

In this analysis, proper locating points should first be chosen for each component. This set of locating points should be made standard for that component and should be used for all machining operations and all position gaging. Diameter of holes, pins, screws, etc. should also be reduced to the fewest sizes permitted by the requirements.

The drawing for the component part should clearly specify the locating points and, where necessary, indicate the methods of producing them. The positions of all the elements limiting the tolerance zone of each finished surface should be independently dimensioned from the locating points, excepting in cases of which the following are examples:

1 The limit widths of a slot to be finished in one setting of the machine are given directly, while the limit location of the desired slot wall is referred to the working points. This arrangement is most fair to the machine adjuster and also makes possible the use of simple plug gages for width.

2 Another exception is the case of a demanded special relationship between two surfaces formed by separate operations. In this case the best procedure will be outlined later. While it has been argued that each surface should be located from that other surface on the same component to which functionally it is most closely bound, experience on the type of work discussed has shown that the best results are obtained by locating substantially all the surfaces from standard locating points properly chosen for that component.

If various locating points are used for machining and gaging a component, the resultant maze of tolerance accumulations could not, in many instances, be untangled by even the famed legal expert from the City of Brotherly Love.

The failure to use the same locating points for all the machining and position-gaging operations on a component is bad practice and its effects are insidious. It frequently results in itself absorbing the permissible variation of a given surface. In many such cases has been witnessed a condition which left to the actual operation "less than no tolerance." Good engineering should not waste or absorb any of the permissible tolerances. These should all be given, as intended, to the actual machining operations.

Having determined the locating points of a component and the steps for obtaining them, the general characteristics of the machining fixture standard for the component should next be determined.

#### SELECTION OF TOLERANCE AND LIMIT ANALYSIS

Choosing of tolerances, and limit analysis, are now in order. The adoption of attainable tolerances and the correct analysis of their effects under all conditions is the crux of interchangeable manufacturing and mass production. Attempt should be made to adhere, as closely as functional conditions will permit, to the larger range of obtainable tolerances suggested in this paper. In analysis the simple male and female engagements may be solved first; then the surfaces entering only into limited functional trains; and lastly, the surfaces entering into all the functional trains for that component. As the tolerance of each involved surface adds to the final variation accumulated through a functional train, it is generally desirable to shorten these trains as much as possible in the design.

Frequently several components are involved in a functional train; also several different trains may involve a particular component. All of the possible ramifications of these must be traced out and considered. Complete tolerance analysis involves methods of logic beyond the present experience of all but a few individuals. A textbook illustrating the technique suitable for tolerance analysis and specification is needed to disseminate knowledge in this branch.

In analysis, only the limits of the tolerances considered are carried through in the equations. Functional and other requirements must be fulfilled all through a mechanical train by the opposed conditions of maxima and minima. This proof assures that all possible combinations of the involved surfaces, when anywhere within their respective limits, will always satisfy the requirements. It therefore follows that any place within the respective limits will be functionally as satisfactory as any other place within, and no preference need be expressed regarding desirability of machining a given surface to its "high" or to its "low" limit. "Middle of the Limits" is a good slogan for the production departments.

Occasionally in analysis it will appear that one or more functions of the mechanism may be secured only by the observance of tolerances so small as to render prohibitive the cost of interchangeability. In this case the mechanism performing that particular function should be redesigned or changed to one permitting easily obtainable tolerances. If a satisfactory change is not discovered and due decision is made to fix minute tolerances, then the special producing means insuring the degree of precision demanded by such tolerances should be determined and specified. We must not calmly step over such a point and go on hoping that somehow during production the gods will be kind. Increased delay and expense will be incurred if the trouble is not solved at the start. The gods do not especially favor production engineers.

In analyzing tolerances it should be borne in mind that necessary clearance between parts is as definite a function as the required operative contact. This becomes of particular importance in firearms, where the demands of outside shape of the weapon result in the permitted space being almost entirely filled with components. Lack of room must ever be faced by the firearms inventor. In spite of this, and in addition to performing many other functions, the mechanism must sustain and operate under a force of the intensity of about 50,000 lb. per sq. in.

#### TOLERANCE DIAGRAMS

Concurrent with tolerance analysis should go the preparation of the necessary diagrams. These should show graphically, for each function, the extreme conditions of contact or clearance resultant from the maxima and minima of the involved surfaces. Basic figures for points of departure should be given. On these diagrams should be expressed the direct limit dimensions adopted for each surface concerned, also, step by step, the accumulating resultant limits through the particular mechanism train considered. The resultant limits should be so marked as to clearly distinguish them from the direct limits. Basic dimensions should carry no limits and are distinguished by a different mark.

These diagrams, with the basic dimensions and figures expressing both direct and resultant limits, are the record sheets of the tolerance analysis. The diagrams should be suitably made and carefully preserved as they represent the history, step by step, of the considerations used in the limit determination. The diagrams, particularly so at first, will be useful during the production of the mechanism. Questions of change in model, tolerance changes, different methods, etc. can be intelligently decided in a short time with their aid. The analysis diagrams with their recorded information will be useful to save duplication of effort and to secure continuity of plan during production, when the designer may be engaged elsewhere. The diagrams, properly made, demonstrate that the respective limits will produce the desired results of function and interchangeability. Faith in the limits is necessary for factory discipline during production.

#### REQUIREMENTS OF COMPONENT DRAWINGS

Component drawings should be made on a sufficiently large scale to permit clear delineation of all surfaces and intersections and to furnish sufficient space for the dimensions. Basic dimensions, suitably distinguished as such, should be entered without limits. The chosen locating points should be clearly shown. The various surfaces should be considered as divided into their proper machining operations during the limit analysis. From the analysis diagrams the adopted limit dimensions necessary to control each operation should be transferred to the component drawing. Resultant limits should not appear on the component drawing.

The contour to be formed by each operation should be dimensioned to provide complete information as to the shape of the cutting tool, and the positions of the essential points in this contour should be given direct to the working points and independent of any other surface. Rare exceptions may be made if a close special relationship is desired between two surfaces formed by separate operations. In this case the standard fixture holding the component is moved on an auxiliary slide to bring one of these surfaces in contact with a fixed stop on the machine platen while machining the other surface. Another exception may be in case of a relatively unimportant surface permitting wide limits; for example, the "run-out" of a mill cut resulting from stopping the cutter in the

component. The latter exception permits the use of a very simple gage from the end of cut to the nearest definite "landmark," and should be so specified on the drawing.

The component drawing should carry all the necessary dimensions for the cutting tool and for the gages required to control each operation. Each limit dimension is to be exemplified in gages of some form. Unnecessary dimensions are to be avoided. The positions of the dimensions should indicate how the component is to be located in fixture and gage, and the correct portions of the surfaces to be gaged for the control of each operation. Routine gages to explore the total surface formed by an operation are expensive both to construct and to use. Seldom will this be required.

In the later detailed design of actual fixture and gages for each operation, no departures from the specified method, locating points, and limits should be permitted. If reason for departure can be shown and a change is adopted, it should be incorporated through the limit analysis and the component drawing. The limit-analysis diagrams should correspond in every detail to the methods specified by the component drawings.

Tolerance may be defined as a zone within which the desired surface must wholly lie. The adopted limits bound this zone. Dimensions specify the plane, cylinder, sphere, cone, etc. forming the boundaries of the tolerance zone.

On the component drawings the boundaries of these tolerance zones must be defined to permit one—and only one—construction. As full faith must later be given every dimension, possibilities of misunderstanding must be avoided. Where necessary, explanatory notes should be carried on the drawing.

In producing the class of mechanism discussed, all dimensions are interpreted by gages. The gages are set and checked by reference blocks. Component drawings are not used by the production department. During the tolerance analysis the actual dimensions of both maximum and minimum are necessarily used in computation and are so expressed on the analysis diagrams. The component drawings are primarily used to specify directly the maximum and minimum dimensions for the respective gages. On the component drawings, therefore, all dimensions other than basic and so marked, should be expressed by the actual dimensions specified for maximum and minimum, thus:

#### CORRECT DESIGN FOR INTERCHANGEABLE MASS PRODUCTION MUST BE BASED ON A FUNDAMENTALLY CORRECT TOLERANCE ANALYSIS

The correct design of a mechanism for interchangeable mass production must be based on a fundamentally correct tolerance analysis. As this involves a preliminary determination of method, fixture and gage for each operation, it permits balancing various types against each other and the selection of the simplest types of method, fixture, and gage to insure attainment of the result sought in each machine operation.

Every opportunity exists here to save time and money in selecting methods and in building equipment, as well as in production.

The time required to determine and specify a correct manufacturing design is extremely small when compared with the results obtainable. Indeed, these results can be had in no other way. The alternate method of "cut and try" during production is costly and entails many delays. Even then the latter can only approximate the results obtainable by a correct analysis of the design.

In case of war the correctness of knowledge and specification as to exactly what is to be made in ordnance matériel may well be the factor which determines defeat or victory. All plans of organization for mass production may be either vitiated or made successful by the degree of excellence entering into the design of the matériel. In spite of our present satisfactory methods of machining and gaging, the neck of the production bottle lies in badly determined manufacturing design of the components sought.

Attempt has been made in this paper to show the steps required in the preparation of correct manufacturing design. When such designing becomes prevalent the neck now usually choking volume production will become enlarged to the proportions of that in the chemist's test tube. This result, in war or peace, will spell great benefit to industry.

# Economic Features of Heat-Exchanger Design

Discusses Factors Determining Economic Area of Heat Exchangers, Particularly as Applied to Oil-Refinery Operations—Presents Graphic Method of Analysis Simpler and More Direct Than the Methods Generally Used

By FRANK L. MAKER,<sup>1</sup> AND MAX W. THORNBURG,<sup>2</sup> EL SEGUNDO, CAL.

THE oil-refining industry offers many opportunities for the conservation of heat. Since crude oil in its liquid state cannot be separated into marketable products, it is necessary to convert part of it, by the addition of heat, into the vapor phase in order to separate the various fractions of different boiling points and values. It is then necessary to abstract the heat in the vapor, so as to return it to the liquid phase for further treatment or for sale. The portion which was not evaporated, or "bottoms," may need to be cooled for convenient handling or storage.

One of the most conspicuous advances in oil distillation during recent years has been the practical abandonment of "batch" processes in favor of continuous operation, in which an uninterrupted flow of crude feed stock, or oil to be separated into its fractions, is pumped into the stills, and the finished or partly finished products and residuum are taken out continuously. With this method of operation it is possible to save much of the heat in the vapors and bottoms that was formerly wasted, by transferring it to the incoming feed.

Furthermore, most crude stills are operated at high temperatures; this results in high flue-gas temperatures. In some cases it may be practicable to save some of this heat in the flue gas to make steam or to heat incoming air.

Refinery operations thus offer a broad field for the use of "heat exchangers," which transfer the heat energy from the hotter to the colder fluid without permitting them to mix, the heat circulating in the system.

But heat exchangers mean investment in equipment with its attendant depreciation, operation and maintenance costs, and also, generally, an increase in the cost of pumping the fluids on account of the necessary pressure drop through the exchanger. Their function is to take the heat which would otherwise be wasted, and which must sometimes be otherwise removed at more or less expense, and use it to replace heat which would otherwise have to be supplied by burning additional fuel. The savings in fuel thus made must pay back, during the useful life of the equipment, the original investment and all of the fixed operating charges. This profit will include allowance for the risk of the equipment or the plant of which it is a part becoming obsolete.

The percentage of the total available heat transferred or saved depends upon the design and operating characteristics of the exchanger, the physical properties of the fluids, their quantities, temperatures, velocities relative to the surface, etc.; and where the above factors are fixed, it depends upon the amount of total transfer surface. The amount of heat transferred increases as the surface is increased, but not in direct proportion, because as the temperatures of the two fluids approach each other the amount of heat transferred through each increment of area becomes less. The cost of the additional equipment, including the additional pumping charges, attendance, etc., increases approximately in proportion to the increase in surface. There is therefore a point beyond which it is not economical to go, and the additional heat saved by increasing the surface beyond this point will not pay a profit considered attractive. On the other hand, if less surface than this is installed, some heat will be wasted which it would be profitable to recover.

The ordinary cut-and-try method of designing heat exchangers is a long and tedious process to determine this economical limit and to compute the area of exchanger surface required. In order to determine this point it is necessary to express the relation between the area and the percentage of the available heat which is

transferred, and also the relation between the area and the total charges. The principal object of this paper is to present a simple method of solving these problems, using graphical means.

## ASSUMPTIONS FOR CALCULATIONS

The assumptions made both in the cut-and-try method, and in the more rational method as presented in this paper are as follows:

- 1 The fluids move in a countercurrent direction
- 2 The specific heats of the fluids remain constant (or a suitable mean value can be used)
- 3 Radiation is neglected
- 4 The heat-transfer factor is constant, or a suitable mean value is used
- 5 The total cost per year of the exchanger varies with the area in a linear relationship.

## NOTATION

- $C_h$  = specific heat of hotter fluid  
 $C_c$  = specific heat of colder fluid  
 $W_h$  = weight of hotter fluid per hr.  
 $W_c$  = weight of colder fluid per hr.  
 $K = \frac{C_h W_h}{C_c W_c}$  or  $\frac{C_c W_c}{C_h W_h}$ , whichever is less than 1  
 $CW$  = smaller of the two products  $C_h W_h$  and  $C_c W_c$   
 $T_{h1}, T_{h2}, T_{c1}, T_{c2}$  = initial and final temperatures of hotter and colder fluids  
 $H_1$  = maximum heat possible to be transferred from hotter to colder fluid  
 $= C_h W_h (T_{h1} - T_{c1})$  or  $C_c W_c (T_{h1} - T_{c1})$ , whichever is the smaller  
 $H$  = heat actually transferred by a given surface  
 $= C_h W_h (T_{h1} - T_{h2}) = C_c W_c (T_{c2} - T_{c1})$   
 $A$  = area of transfer surface of exchanger, sq. ft.  
 $U$  = heat-transfer factor, B.t.u. per sq. ft. per deg. fahr. per hr.  
 $E$  = efficiency of heat exchanger  
 $= \frac{H}{H_1} = \frac{\text{Heat actually transferred}}{\text{Heat available for transfer}}$   
 $Q = \log_e \left( \frac{1 - EK}{1 - E} \right)$   
 $V$  = value of heat saved in dollars per million B.t.u.  
 $B$  = increase in annual cost, including profit, for each additional square foot of transfer surface  
 $X$  = load factor = part of year exchanger is in operation  
 $R = \frac{114.2 B}{XU(T_{h1} - T_{c1})V}$

## TRIAL-AND-ERROR METHODS OF DESIGN

The cut-and-try method of designing heat exchangers ordinarily followed usually involves the following steps:

- 1 *Given Data:*
  - a Initial temperatures  $T_{h1}$  and  $T_{c1}$  of the two fluids
  - b Quantities  $W_h$  and  $W_c$  of both fluids
  - c Specific heats (or heat capacities)  $C_h$  and  $C_c$  of both fluids.

2 *Data Assumed:* The heat-transfer factor  $U$  in B.t.u. per sq. ft. per deg. per hr. is assumed from experience with similar exchangers, fluids, and flow conditions. It is modified principally by the velocity and viscosity; and after the design is made it is necessary to check back to see that the working conditions corre-

<sup>2</sup> Asst. Chief Engineer, Manufacturing Dept., Standard Oil Co. of California. Mem. A.S.M.E.

Presented by Mr. Thornburg at a meeting of the Los Angeles Section of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS, June 20, 1924.

spond with those on which the assumed  $U$  was based, and particularly that these conditions can be met with a reasonable pressure drop through the exchanger.

3 From the given data a guess is made at the probable final temperature of one fluid, and the corresponding temperature of the other fluid is computed. (The final temperature of one of the fluids may be also one of the given data, as in the case of a cooler for cooling oil from one temperature to another. In this case the quantity of other fluid may have to be computed, as, for example, the quantity of cooling water required. This simplifies the problem.)

4 The mean temperature difference is then computed by applying Grashof's formula

$$T_m = \frac{(T_{h1} - T_{c2}) - (T_{h2} - T_{c1})}{\log_e \left( \frac{T_{h1} - T_{c2}}{T_{h2} - T_{c1}} \right)}$$

and the area then computed by the formula:

$$A = \frac{\text{Heat transferred}}{\text{Heat-transfer factor} \times \text{Mean temperature difference}}$$

5 With the final temperatures, size of exchanger, etc. thus assumed and checked, as per step 2, the value of the heat saved per year can be computed and the cost per year estimated.

6 By assuming a number of such temperatures and computing the corresponding areas, it is possible to plot a curve showing the relation between the area and the annual value of the heat saved, and another curve of the relation between the area and the annual cost. A third curve plotted from the difference of these two will show the net return and the area giving the largest net return will be the economical limit.

This necessarily involves a considerable amount of work, so much so that judgment and precedent alone are often relied upon to determine the desirable area and final temperatures.

#### PRESENTATION OF EXACT METHOD

The method presented herewith simplifies this work considerably and may be explained as follows:

The initial temperatures  $T_{h1}$  and  $T_{c1}$  of the two fluids are generally among the given data, as well as the average specific heats of  $C_h$  and  $C_c$  and the quantities per hour  $W_h$  and  $W_c$ .

The hotter fluid cannot be cooled by heat exchange to a lower temperature than the initial temperature  $T_{c1}$  of the colder fluid, and the colder fluid cannot be heated to a higher temperature than the initial temperature of the hotter fluid  $T_{h1}$ .

The maximum heat that the hotter fluid can lose is:

$$H_h = (T_{h1} - T_{c1})C_h W_h$$

and the maximum heat the colder fluid can absorb is:

$$H_c = (T_{h1} - T_{c1})C_c W_c$$

Since the heat given up and that absorbed are equal, neglecting radiation, the smaller of these two quantities is the maximum heat transferable. We will denote it by  $H_1$ . Denoting the smaller of the two products  $C_h W_h$  and  $C_c W_c$  by  $CW$ , the maximum amount of transferable heat will be

$$H_1 = CW(T_{h1} - T_{c1})$$

A given exchanger will transfer only a certain proportion  $E$  of this maximum possible amount. This factor  $E$  may be taken as a basis for comparing exchangers with identical initial conditions but different areas; it will be termed the "efficiency of the exchanger."

If we further express the relative heat capacity of the two fluids by  $K$ ,

$$K = \frac{C_c W_c}{C_h W_h} \text{ or } \frac{C_h W_h}{C_c W_c}$$

whichever is less than 1. The following equation can be written for the relation between area and efficiency (see appendix for derivation):

$$A = \frac{CW \log_e \left( \frac{1-EK}{1-E} \right)}{1-K} \quad [1]$$

or, letting

$$Q = \frac{\log_e \left( \frac{1-EK}{1-E} \right)}{1-K} \quad [2]$$

$$A = \frac{CW}{U} \times Q \quad [3]$$

For the given and assumed data  $CW/U$  is a constant for the problem, and  $Q$  is then proportional to the area. By assuming different

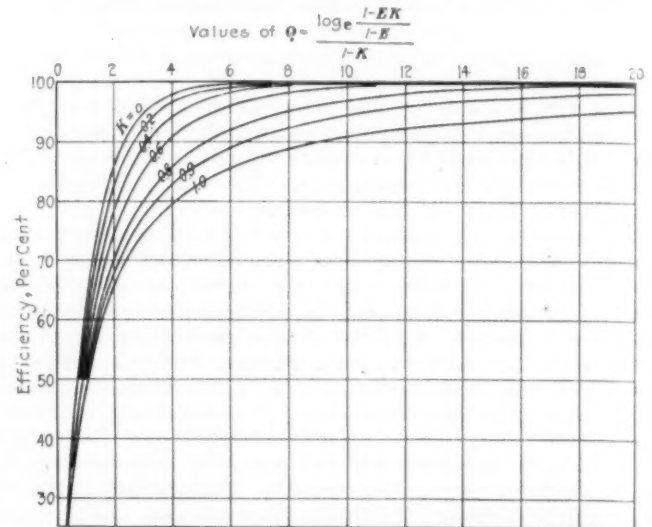

FIG. 1 AREA-EFFICIENCY-CURVES FOR HEAT EXCHANGERS

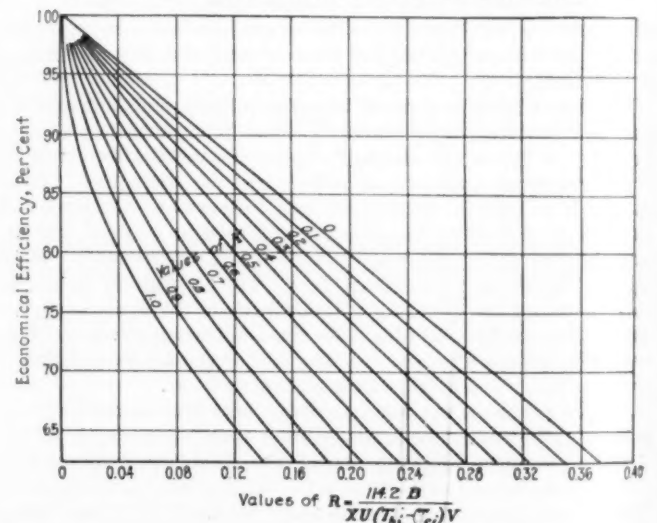

FIG. 2 EFFICIENCY FOR MAXIMUM SAVING (RELATION BETWEEN  $E$  AND  $R$  FOR VARIOUS VALUES OF  $K$ )

values of  $K$ , a series of curves can be plotted showing the relation between  $Q$  (or by a change of scale the relation between the area) and efficiency (see Fig. 1). These curves rise rapidly at first and then bend rather sharply to the right, approaching the 100 per cent line, but not reaching it.

On the steep part of the curve a small change in area produces a large change in efficiency, but on the flatter part a large change in area produces a very small change in efficiency. It is evident that there is an area at which the annual cost of an additional square foot of exchanger will be just equal to the value of the additional heat saved, and it will not be economical to go beyond this. The final step in the solution of our problem is to locate this point.

It can be shown that this point may be determined by the equation

$$(1-EK)(1-E) = R \quad [4]$$

in which

$$R = \frac{114.2 B}{XU(T_{h1} - T_{c1})V} \quad [5]$$

where  $B$  = increase in annual cost per sq. ft. of additional surface, including pumping charges and profit

$X$  = load factor = part of year exchanger is in operation, and

$V$  = value of heat saved in dollars per 1,000,000 B.t.u.

It will be noted that the expression for  $R$  contains the factors which define the annual cost of operating the heat exchanger, and the value of the available heat—all of which factors are known for any given problem. Substituting these known quantities in Equation [5] gives a value of  $R$  for the problem, and this in turn gives a quadratic equation for the economical efficiency [4], which may be solved by substituting in this equation the previously computed value of  $K$ .

To simplify these computations further, the chart of Fig. 2 has been devised, giving graphically the relation between  $E$  and  $R$  for various values of  $K$ .

Finally, Figs. 1 and 2 have been combined in the form shown in Fig. 3. This makes a convenient working diagram, the use of which will now be explained by examples.

#### USE OF CHARTS

The following is the procedure for the use of these charts in solving problems where the area of the heat exchanger is required.

1 Note the data on the fluids:

$$W_c, W_h, C_c, C_h, T_{c1}, T_{h1}.$$

2 Compute  $K = \frac{C_c W_c}{C_h W_h}$  or  $\frac{C_h W_h}{C_c W_c}$  (whichever is less than 1).

3 For the type of heat exchanger assumed, assume a heat-transfer factor  $U$ , basing it upon the velocity and previous experience with similar type of exchangers.

4 Estimate the increase in annual charges,  $B$ , per sq. ft. of additional surface for the assumed type of heat exchanger, and also the value  $V$  of the heat saved per 1,000,000 B.t.u.

5 Note whether the service is continuous or not. If it is,  $X$  has a value of 1. If in service half the time  $X = 0.5$ , and so forth.

6 Compute  $R = \frac{114.2 B}{XU(T_{h1} - T_{c1})V}$

7 On Chart 2 or 3 find the value of

$E$  corresponding to this value of  $R$  and computed value of  $K$ .

8 On Chart 1 or 3 find the value of  $Q$  for this value of  $E$  and compute the area

$$A = \frac{CW}{U} Q$$

9 Find the final temperatures  $T_{h2}$  and  $T_{c2}$ , if required. The temperature change of the fluid which has the largest  $CW$  is  $KE(T_{h1} - T_{c1})$  and the temperature change of the other fluid is  $E(T_{h1} - T_{c1})$ .

EXAMPLE I. Design a heat exchanger for heating feed stock by hot residuum for the following conditions:

Feed, 5000 gal. per hr. of crude, or  $W_c = 38,500$  lb. per hr.

Residuum, 4000 gal. per hr., or  $W_h = 32,000$  lb. per hr.

Initial temperature of residuum = 500 deg. Fahr. =  $T_{h1}$

Initial temperature of feed = 65 deg. Fahr. =  $T_{c1}$

Specific heat of both residuum and feed, approximately 0.5

Load factor  $X = 0.9$ .

Assume a double-pipe exchanger with total rate of increase in annual charges of \$3 per sq. ft., including profit, and giving a heat-transfer factor  $U$  of 35 B.t.u. per sq. ft. per deg. per hr. The heat saved reduces the fuel consumption on the still. With fuel oil at \$1.50 per 42-gal. barrel weighing 8 lb. per gal. and having 18,700 B.t.u. per lb. and taking the furnace efficiency at 60 per cent, the cost per million B.t.u. is

$$\frac{1.50 \times 1,000,000}{42 \times 8 \times 18,700 \times 0.6} = \$0.40 = V$$

With these data we can now find the value of  $R$ :

$$R = \frac{114.2 \times 3}{0.9 \times 35(500 - 65) \times 0.40} = 0.0625$$

The value of  $K$  is  $\frac{32,000}{38,500} = 0.83$ , and from the economical efficiency chart, Fig. 2, or from Fig. 3, for these two values we find  $E = 80.5$  per cent.

Turning to Fig. 1 or Fig. 3, for a value of  $E = 0.805$  and  $K = 0.83$ , a value of  $Q$  is found equal to 3.1. The required area is now found to be

$$A = \frac{C_h W_h}{U} Q = \frac{0.5 \times 32,000}{35} \times 3.1 = 1420 \text{ sq. ft.}$$

The final temperatures of the two fluids may now be computed as follows:

$$T_{h2} = T_{h1} - E(T_{h1} - T_{c1})$$

$$= 150 \text{ deg.}$$

$$\text{while } T_{c2} = T_{c1} + KE(T_{h1} - T_{c1})$$

$$= 355 \text{ deg.}$$

EXAMPLE II. Oil heater using exhaust steam. Oil, 800 bbl. per hr. = 40,000 gal. per hr., or  $W_c = 312,000$  lb. per hr.; specific heat of oil =

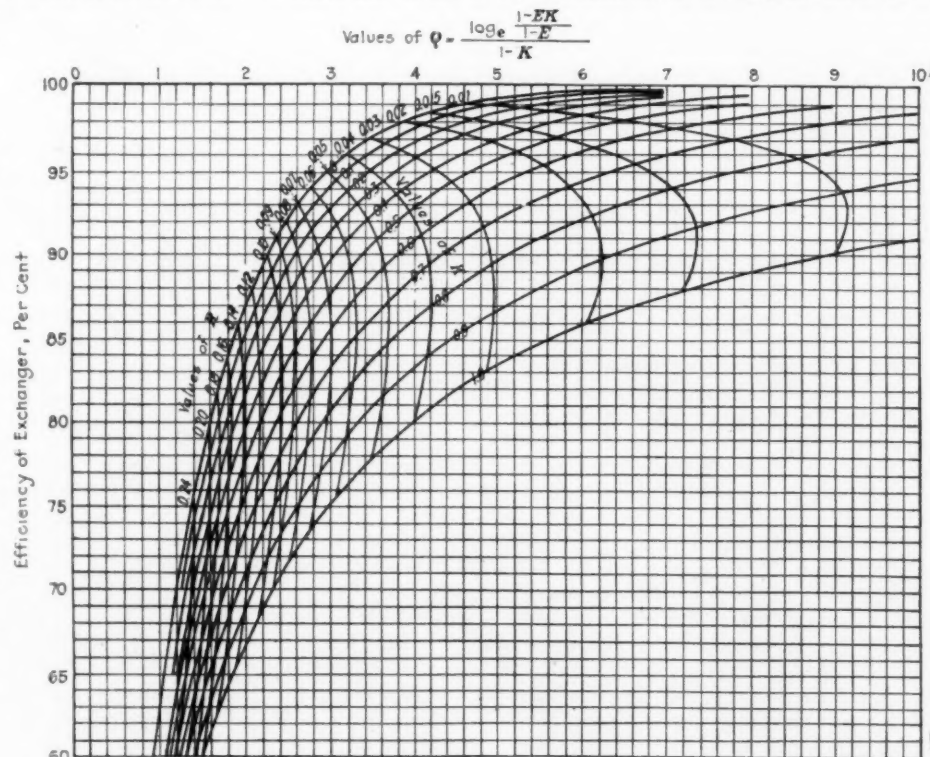

FIG. 3 AREA-ECONOMICAL EFFICIENCY CURVES FOR HEAT EXCHANGERS

0.5. Available steam unlimited at no cost. (In this case where the steam is condensing at constant temperature, the specific heat of the steam as such should not be taken. The quantity  $CW$  is rather the total heat given out by the fluid for a temperature change of one degree. In the case of steam condensing at constant temperature this can only be interpreted as infinity, and the value of  $K$  is  $1/\infty$  or 0.)

$B = \$1.80$  per sq. ft. Heater is in service, say,  $1/3$  of time, or load factor  $X = 1/3$ . Value of heat saved = \$0.50 per 1,000,000 B.t.u.

$$U = 150, T_{h1} = 212, T_{c1} = 90$$

whence

$$R = \frac{114.2 \times 1.80}{1/3 \times 150(212 - 90) \times 0.5} = 0.0674$$

and

$$E = 0.9325$$

$K$  being 0. For this value of  $E$ ,  $Q = 2.72$ , and

$$A = \frac{312,000 \times 0.5}{150} \times 2.72 = 2820 \text{ sq. ft.}$$

The outlet temperature of the oil will then be

$$T_{c2} = 90 + 0.9325(212 - 90) = 90 + 113 = 203.8 \text{ deg.}$$

In this case, even though the exhaust steam is valued at nothing, it would not pay to heat the oil to more than 204 deg. Fahr. if the heat can be subsequently put into it at \$0.50 per million B.t.u., because of the additional charges and profit required by the equipment. This is a case where the proper temperature could only be determined by economic considerations.

In cases where one of the final temperatures is fixed by the necessities of operation, it will not be necessary to compute  $R$  or use Fig. 2 at all. The necessary efficiency can be computed from the temperature relations and

the value of  $Q$  found on Fig. 1 directly. Care should be taken, however, to see that operating necessities really govern, and not the dictum of the operator as to what is desirable. An explanation of the economics should in this case bring forth the reason for a variation from the economic area, if it is necessary.

The specific heat as well as the heat-transfer factor are assumed to be constant in this work. Average values should be taken. The error from variation in specific heat will probably be within the limit of the error of the assumptions. In the case of vapors condensing at decreasing temperatures, such as oil vapors, the quantity equivalent to the specific heat should be obtained by computing both latent and sensible heats and dividing by the weights.

#### COST OF EXCHANGER AND VALUE OF HEAT

The cost of the exchanger has been assumed to be a linear function of the area. An installation of any size of heat-exchanger surface will probably be made up of standard units for which an average price per square foot can be estimated. In addition to the standard units there will probably be a setting of some sort and necessary pipe-line connections which will not vary much with the area. The cost can therefore be represented by an equation of the form

$$M = N + BA$$

It will be necessary of course to have an approximate idea of the type of heat exchanger which will be used, in order to make this estimate.

From the first cost of the installation the annual charges should be computed, figuring the life conservatively. To this should be added the estimated annual maintenance and repair charges, the attendance, if any, and the cost of cleaning if this is required periodically. The nature of the fluid will determine whether cleaning is required.

In general a double-pipe exchanger, that is, one having one pipe inside of another, will only be profitable for small quantities with high temperature differences, as this type is relatively expensive compared with a drum containing a number of tubes with the necessary baffles to secure the desired flow condition. This is exemplified in condenser practice where large condensers for steam are of the tube type contained in drums and smaller condensers or coolers, such as ammonia condensers, are of the double-pipe type.

The value of the heat to be taken is not always merely the value of the fuel saved. In some processes, as in condensing vapors, a heat exchanger transferring the heat from the condensing vapor to feed stock might be computed to have an economic area less than that necessary to condense all the vapor if the value of the fuel alone is taken. However, in this case a necessary part of the operation is to condense all the vapor, and if this is not done in the heat exchanger it will have to be done with some sort of condenser. The cost of doing this by some other means can properly be added to the value of the heat saved by the heat exchanger in computing the economic area of the heat exchanger.

In other cases, especially where the heat medium is steam which is generated by an existing power plant, the cost of the steam is generally taken to include all attendance and fixed charges on the boiler plant. However, if the heat exchanger saves only a small part of the steam being generated in the plant, such reduction would probably not lower the operating costs of the boiler plant, as unless this reduction were very considerable the attendance would not be decreased nor the fixed charges, and the only real saving would be practically the cost of the fuel and water.

There may be other cases where the use of heat exchangers may increase the capacity of units to such an extent that it will not be necessary to build additional units which increased demands might otherwise require. In this case the value of the heat should be taken to include the fixed charges and attendance on the equipment, as well as the value of the fuel.

In other cases the temperature of the feed stock may have an effect on the process, the high temperature of the feed stock, for instance, possibly increasing the yield in a process which might be worth much more than the value of the fuel saved alone, and can properly be allowed for in computing the value of the heat to be used in determining the economic area.

These various cases are mentioned to show the necessity of making an engineering estimate of the situation instead of taking the accountant's "cost" figures as a guide.

It should be noted that the life to be taken is not necessarily governed by the heat-exchange equipment itself, as the equipment of which the heat exchanger is an auxiliary may have a shorter life and the salvage value of the heat exchanger may be small. It is well to be conservative in making these estimates.

One point should be noted in regard to the area which will return any given profit on the investment. It is not correct to take the area such that the total net earnings, minus the operating charges, divided by the total investment is equal to the minimum profit. This will be made clear by referring to Fig. 4, where curve  $ACB$  represents the rate at which the gross earnings increase as the exchange surface increases, and the straight line  $AB$  represents the

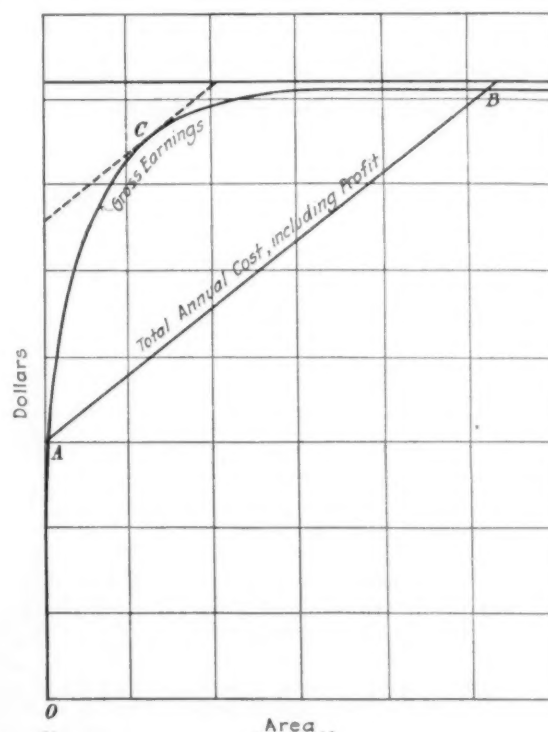

FIG. 4 CHART ILLUSTRATING MOST ECONOMIC POINT IN AREA SELECTION OF HEAT EXCHANGERS

total annual cost of the exchanger, as the area increases, including the minimum attractive profit. This intersects the earnings curve at two points, A and B, where the total annual earnings are just equal to the total annual charges, including profit. An area less than that corresponding to point A or greater than that corresponding to point B will not return a profit equal to the minimum acceptable. The rate at which the annual cost increases is the slope of the line  $AB$  and appears in the formula as term  $B$ . Similarly the slope of the curve  $ACB$  at any point represents the rate at which the total earnings increase as the area increases. This is very rapid at first but the curve becoming nearly horizontal after bending sharply to the right indicates that the earnings are then increasing very slowly. The large rate of earning of the first area helps maintain the average up to the point  $B$ . At point  $C$ , where the tangent to the curve is parallel to the line of total cost, the rate of increased earning is just equal to the increased cost, and all additional area beyond this point will not pay the minimum acceptable profit. The point  $C$  is determined mathematically in the appendix and gives the maximum area which will pay the charges and minimum attractive profit, although the average return on the whole exchanger will be higher than the minimum profit.

#### Appendix

The derivation of the formulas for economical efficiency is as follows, using the notation already given:

The initial temperatures of the two fluids being  $T_{h1}$  and  $T_{c1}$ , it is obviously not possible to cool the hotter fluid below  $T_{c1}$  or raise the temperature of the colder fluid above  $T_{h1}$  by any transfer of heat between them.

The maximum available heat from the hotter fluid is then

$$H_{1A} = C_h W_h (T_{h1} - T_{c1})$$

and the maximum heat the cooler fluid, can absorb is

$$H_{1c} = C_c W_c (T_{h1} - T_{c1})$$

In general, these two will not be equal and the lesser quantity governs, and the following two cases are therefore to be distinguished:

Case I:  $C_h W_h$  is less than  $C_c W_c$

Case II:  $C_c W_c$  is less than  $C_h W_h$

CASE I. Here the maximum heat which can be transferred is determined by the hotter fluid. The hotter fluid could possibly be cooled from  $T_{h1}$  to  $T_{c1}$ . If it is actually cooled to  $T_{h2}$ ,

$$E = \frac{T_{h1} - T_{h2}}{T_{h1} - T_{c1}}$$

$$\frac{C_h W_h}{C_c W_c} = K \quad (K \text{ is less than } 1)$$

$$T_{c2} - T_{c1} = K(T_{h1} - T_{h2})$$

$$= EK(T_{h1} - T_{c1})$$

$$T_{c2} = T_{c1} + EK(T_{h1} - T_{c1})$$

$$T_{h2} = T_{h1} - E(T_{h1} - T_{c1})$$

and

$$A = \frac{H}{U} \frac{\log_e \left( \frac{T_{h1} - T_{c2}}{T_{h2} - T_{c1}} \right)}{(T_{h1} - T_{c2}) - (T_{h2} - T_{c1})} \text{ by Grashof's formula,}$$

and since  $H = EH_1$ , it can be shown that

$$A = \frac{H_1}{U(T_{h1} - T_{c1})} \frac{\log_e \left( \frac{1 - EK}{1 - E} \right)}{1 - K}$$

or

$$A = \frac{C_h W_h}{U} \frac{\log_e \left[ \frac{1 - EK}{1 - E} \right]}{1 - K} = \frac{C_h W_h}{U} Q$$

CASE II:

$$E = \frac{T_{c2} - T_{c1}}{T_{h1} - T_{c1}}$$

$$\frac{C_c W_c}{C_h W_h} = K_1 \quad (K_1 \text{ less than } 1)$$

and

$$T_{h2} = T_{h1} - EK_1(T_{h1} - T_{c1})$$

$$T_{c2} = T_{c1} + E(T_{h1} - T_{c1})$$

$$A = \frac{H}{U} \frac{\log_e \left[ \frac{T_{h1} - T_{c2} - E(T_{h1} - T_{c1})}{T_{h2} - EK_1(T_{h1} - T_{c1}) - T_{c1} + EK_1(T_{h1} - T_{c1}) + T_{c1}} \right]}{T_{h1} - T_{c1} - E(T_{h1} - T_{c1}) - T_{h2} + EK_1(T_{h1} - T_{c1}) + T_{c1}}$$

and since  $H = H_1 E$ , it can be shown that

$$A = \frac{C_c W_c}{U} \frac{\log_e \left( \frac{1 - EK_1}{1 - E} \right)}{1 - K_1}$$

$$= \frac{C_c W_c}{U} Q$$

In the expression for the area  $A$  thus found for both cases,  $C_c W_c/U$  is a constant for the given conditions of the problem, so that  $Q$  is proportional to the area. For each value of  $K$  a curve can be drawn showing the variation of the efficiency  $E$  as  $Q$  changes. The computation for these curves presents no difficulty except for the value of  $K = 1$ , which gives for  $Q$  an indeterminate quantity of the form  $0/0$ . By differentiating it can be shown that  $Q = E/(1 - E)$  in this case.

For a given set of conditions where the total heat available for transfer is  $H_1$ , the area required is

$$A = \frac{H_1}{U(T_{h1} - T_{c1})} \frac{\log_e \left( \frac{1 - EK}{1 - E} \right)}{1 - K}$$

If the total annual charges, including minimum profit and pumping, are expressed in an equation of the form

$$M = N + BA$$

where  $M$  is the total annual charge,  $N$  is a constant, and  $B$  is the increase in annual charges for each additional square foot of exchange surface added, then the total annual charges for the area giving efficiency  $E$  is

$$M = N + \frac{BH_1}{U(T_{h1} - T_{c1})} \frac{\log_e \left( \frac{1 - EK}{1 - E} \right)}{1 - K}$$

The total value of the heat saved per year, if the load factor is  $X$ , is

$$P = \frac{8760EH_1VX}{1,000,000}$$

where  $V$  is the value of the heat in dollars per 1,000,000 B.t.u.

The rates of increase of cost of service and value of service as the efficiency

is increased are the derivatives of these two quantities with respect to the efficiency, and the value of the maximum economic efficiency is the value which will make these two derivatives equal.

The rate of increase of the cost of service is

$$\frac{dM}{dE} = \frac{BH_1}{U(T_{h1} - T_{c1})(1 - K)} \frac{(1 - E)(-K) - (1 - EK)(-1)}{(1 - E)^2}$$

$$= \frac{BH_1}{U(T_{h1} - T_{c1})(1 - EK)(1 - E)}$$

The rate of increase of the value of service is

$$\frac{dP}{dE} = \frac{8760}{1,000,000} H_1 V X$$

The economical area will be that at which the rate of increase of the cost of service is just equal to the rate of increase of the value of the service. Equating the two derivatives and transforming the equation,

$$KE^2 - (1 + K)E + 1 - \frac{114.2 B}{U(T_{h1} - T_{c1}) V X} = 0$$

$$E = \frac{1 + K \pm \sqrt{(1 + K)^2 - 4K \left( 1 - \frac{114.2 B N}{U(T_{h1} - T_{c1}) V X} \right)}}{2K}$$

Representing by  $R$  the quantity  $114.2 B N / U(T_{h1} - T_{c1}) V X$ ,

$$E = \frac{1 + K - \sqrt{(1 + K)^2 - 4K(1 - R)}}{2K}$$

This equation may be easily plotted by putting it in the form

$$R = KE^2 - (1 + K)E + 1$$

and a curve of  $E$  against  $R$  for several values of  $K$  is given in Fig. 2.

## Planning the Future Power System

WATER powers may be divided into two classes, run-of-river developments, and those that have storage capacity, either natural or artificial. Large water storage can do much toward insuring a continuous power supply from a given stream, but experience has shown that over a period of years the largest storage capacity is likely to be entirely depleted. A power supply from a steam plant can be practically assured by providing an adequate fuel supply against any emergency that may arise that would interfere with obtaining fuel. If coal is not available from one source, it may be obtained from another. Or if one class of fuel is not available, there is the possibility of changing to another. Therefore, there are a number of courses that may be taken advantage of in an emergency to insure a fuel supply to a steam plant. No such flexibility exists with the storage capacity of a water plant as with a steam plant. For an adequate water supply the changing characteristics of nature must be contended with. For periods of years the supply may always be in excess of demands, then over another period nature may not be so bountiful and an acute shortage may be the result. When such conditions arise, there is nothing that will meet the emergency but adequate steam capacity, as has been the experience in different parts of the country during the last five or six years.

The necessity of steam reserve in large water-power developments has changed the whole economic aspect, not only of making the developments, but also in operation. Where systems covering wide areas of country are interconnected, there may be run-of-river plants in one locality and plants that have storage capacity in another. The peak loads in one area may occur at a different time from those of another, due either to a difference in time or to the characteristics of the load, or both. At the various seasons the rainfall may be different on one watershed from that on another, or the rainy seasons of the different sections may not coincide. Into such a diversity of water-power supply supplemental power must be provided by steam to insure against the effects of protracted droughts. If the steam plants are to give a maximum of service, they must be located at the most logical points.

To take into consideration all the factors and arrive at the most economical solution of the problem will require a careful study, not only of the individual systems, but of the interconnected system as a whole.—*Power*, Nov. 4, 1924, p. 731.

# "Manit" System for Measuring and Stimulating Labor Effort

By HASBROUCK HAYNES,<sup>1</sup> CHICAGO, ILL.

*The paper describes a system of wage payment and production incentive based on a unit of labor effort known as the "Manit" (man-minute) in which the worker receives a bonus for his production in excess of sixty manits per hour. The system also includes incentives for minimizing spoiled work and a bonus for supervisors.*

SLAVERY and serfdom, with no compensation except a scant living ration, was the first step toward commercially organizing human effort. Later, with the freedom of man, "day work" developed so that the laborer could voluntarily hire out at so much per day. As human time became more and more valuable, the hourly basis replaced the daily basis of pay. This took place especially when the hours of the working day dropped from 16 to 14 to 12 to 10, and more recently to 8 hours per day.

Piece work, which dates back to medieval times, was the first attempt to establish an output basis for compensation. This was a modification of contract work to the individual, with an agreed price per piece.

The Halsey premium plan, which guaranteed an hourly wage with a premium for saving time as against past performances, was the next progressive step. This was one of the first time-sharing plans. It was used by Frederick A. Halsey in the late eighties and the early nineties of the last century.

The Taylor differential piece-work system with a low and a high piece rate was the first to have a stop-watch time-study basis for setting the task. It was an important phase of the "scientific management" developed by Frederick W. Taylor, also in the eighties and nineties of the nineteenth century.

The Gantt task with bonus was a forward step made by Henry L. Gantt in the first decade of the twentieth century. He used a guaranteed hourly rate with day work below standard and piece work above standard.

The Emerson efficiency plan of wage payment is a guaranteed hourly rate and a standard time with variable bonus at two-thirds standard time and becoming constant at 100 per cent efficiency or standard. This plan was devised by Harrington Emerson in the early years of this century. The Emerson efficiency scale from 67 to 100 per cent or higher was the first real rating basis for the comparison of different operators and different departments.

The Bedaux premium point system devised by Charles E. Bedaux reverts somewhat to the Halsey premium plan. This system has been developed since the World War. The Bedaux point or "B" is a minute of work including rest and delay allowances, 60 B's constituting an hour of work.

A number of other wage incentive plans have been devised and applied by different engineers from time to time, but possibly these mentioned above are the better known and have been the more widely successful.

## THE "MANIT" SYSTEM

The "Manit" System is a recent development in labor-incentive methods. It is based on the man-minute as a unit for measuring labor effort. It is an intensive plan which not only measures and stimulates labor effort, but also furnishes the management a complete control of all labor losses. It provides special incentive both to the workers to speed up and to the supervision further to encourage the workers and to reduce delays to a minimum. It is applicable to all classes of manual labor.

Standard times for production performances, established and checked through scientific methods, are expressed in terms of "manits" instead of man-hours, which latter is the customary unit for recording labor effort. A "manit," as employed in this system, is

equal to a standard man-minute of work. The regular hourly wage of the worker is not disturbed, but to justify the wage he must produce on a daily average at least sixty manits of work in every sixty minutes of time.

When the manits of work produced in a day exceed the man-minutes of time actually taken, bonuses are paid to the workers and their supervisors according to the excess manits produced. The bonuses to the supervisors (but not to the workers), are charged with the idle minutes of employees waiting for something to do. This idleness may be due to equipment breakdowns, or to no material or orders to work on, or to other causes beyond the control of the workers. Better quality of workmanship is stimulated through manit credits or debits, which act, as the case may be, as quality bonuses or spoilage penalties to the workers.

## LABOR TIME LOSSES

The accompanying chart, Fig. 1, shows graphically the proportion of labor losses in the average day-work department where the

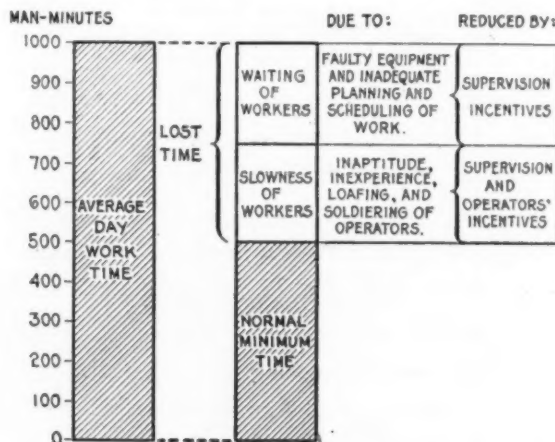

FIG. 1 LABOR LOSSES IN THE AVERAGE DAY-WORK DEPARTMENT

employees are paid merely for the time they put in, largely irrespective of individual output. From numerous experiences it has been discovered that the average day worker takes about twice as long to do his work as is really necessary without over-exertion. That part of his time which is lost has been found on an average to be divided about equally for various classes of industrial work into

- Waiting time, which is beyond the workers' control
- Slowness, which the worker should be able to correct.

Waiting time, for which the supervision is largely responsible, is minimized through the supervision incentives. Such lost time as this is due to breakdowns of equipment or to no material or orders for the worker to work on.

Slowness, expressed in inaptitude, inexperience, loafing, and soldiering of workers, is largely due to the state of mind of the operator. With proper incentives for him to speed up and with training and encouragement from his foreman this loss is likewise minimized.

Periodically for comparative purposes all labor time losses are converted into labor money losses. Thus every possible means is constantly brought to bear to stimulate labor effort and to reduce labor losses and labor costs to a minimum. As a positive indication of results obtained, labor savings effected are accurately recorded and periodically accumulated.

It has been said that the Manit System has been developed largely on the principle—"Watch the minutes and the hours will take care of themselves." This clearly states the idea, and while it might appear difficult to catch every wasted minute, still, as they are eliminated there are fewer and fewer of them to record.

<sup>1</sup> Pres., Haynes Corporation, Engineers. Assoc. Mem. A.S.M.E. Contributed by the Management Division and presented at the Spring Meeting, Cleveland, Ohio, May 26 to 29, 1924, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. All papers are subject to revision.

## SOME FEATURES OF THE MANIT SYSTEM

The following is a more detailed description of this system:

1 All time standards are expressed in terms of manits, each of which is equal to a standard man-minute of work. A worker must do his work in less time than standard to earn a bonus.

2 All time standards established for each operation or job permit the normal or average worker to make up to as high as a 30 per cent bonus over and above his hourly wage, provided he does his work in as short a time as the normal minimum time. The expert workers can make even more than 30 per cent additional.

3 The normal minimum time for each operation, from which the standard time is calculated by allowing for bonus and the company's share in the time savings after standard, is determined from stop-watch observations of the elements of the work. These observations are confined to the productive or effort time to perform

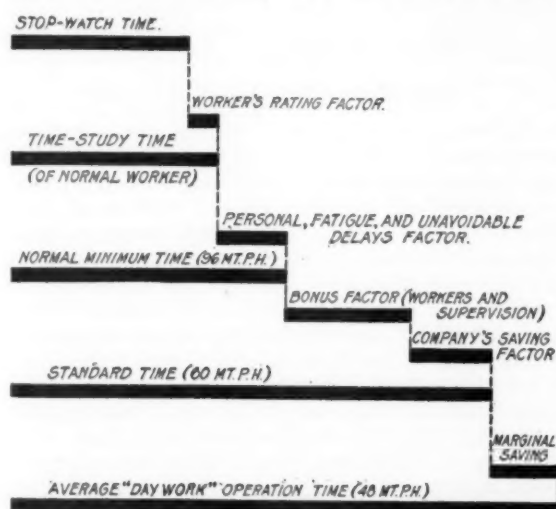

FIG. 2 FACTORS ENTERING INTO THE SETTING OF STANDARD TIMES FOR THE MANIT SYSTEM

the operation. Should the worker studied be faster or slower than the normal worker, the stop-watch time is modified by the observer's rating of the operator with respect to the normal operator. To the normal time-study time thus obtained a proper allowance, according to the circumstances, for fatigue and for personal and other unavoidable delays is added to obtain the normal minimum time. The normal worker should therefore reduce his time on each operation first to the standard time and finally to the normal minimum time.

4 Fig. 2 shows graphically the steps to be taken in setting standards for the Mani System. This refers to a case, as explained more fully later, where the workers and the company share equally in the value of the time saved after standard has been reached—the supervision receiving its portion from the company's share. It will be noted that the day-work time was more than three times the stop-watch time and about twice the normal minimum time.

5 The performances of all employees, gangs, and departments are rated weekly on a manit-per-hour scale, where 60 manits per hour is standard. Therefore at standard the worker must turn out 60 manits of work in 60 minutes of time. From 82 to 96 manits per hour is the normal ultimate—according to the percentages of time saved less than standard time—shared with the employees. The normal ultimate rating corresponds to the normal minimum time. It is the rating at which the worker makes a 30 per cent bonus.

6 In industries where the production conditions are standardized all the value of the savings in time is given to the workers and supervision after reaching and exceeding the standard rating. Where the conditions are unstandardized an equal division of the savings is shared between the company and the workers after the standard rating has been exceeded. In this latter case the supervisor's allotment comes out of the company's share. In each case the supervision's allotment is one-fifth that of the workers, which allotment is merely a fund out of which supervision bonuses are paid, as is later described.

7 The pre-bonus margin in manits per hour that each operation,

gang, and department is below the standard rating of 60 manits per hour is accurately determined for several weeks, or months if desired, prior to bonus installation. This is done in order to check the adaptability of the standard times set to seasonable changes of volume and product, and to predetermine accurately the cost margins or potential savings.

8 Waiting time, due to breakdowns of equipment, waiting for material or orders, or to any other causes beyond the control of the workers, is not charged against the bonus time of the workers but only against the bonus time of supervisors.

9 Bonuses are paid to supervisors, such as superintendents, foremen, and gang bosses, out of the supervision bonus fund above mentioned, based on the manit-per-hour ratings of the departments, gangs, or employees directed after deducting waiting-time losses.

10 The normal supervisor has the same ultimate opportunity to make as high as 30 per cent bonus over and above his regular salary that the normal worker has. To attain this amount of bonus he would have to have no waiting time and the employees under him would have to be averaging a 30 per cent bonus, which is equivalent to the normal ultimate rating.

11 To control quality of workmanship, no credit in manits produced is given a worker in calculating his bonus for labor expended by him which fails to pass inspection. To further control quality in extreme cases, the cost of material spoiled (including the labor of preceding operations) converted into manits is also charged against the output of the worker responsible.

12 Where a certain amount of spoiled work seems inevitable, spoilage standards from past performances are established. As these are diminished or exceeded, credits or debits in manits, as the case may be, corresponding to the saving or loss effected are applied to the worker's output in calculating his bonuses. These credits and debits act as extra bonuses or penalties for decreasing or increasing spoilage.

13 All labor losses due to such workers as are performing below standard, to waiting or idle time, and to spoiled work are recorded and periodically converted into money losses. This provides a complete control for planning and scheduling on the exception principle.

14 The time, production, bonus and control records required by the system are handled with slight, if any, permanent additions to the company's regular shop and office clerical force. This is made possible by the simplicity of records, by the reduction in the number of productive workers to be kept track of that are required for the same volume of business, and through the tendency of shop clerks to take a faster gait as the workers about them improve.

15 Net savings in labor cost after installation as compared with pre-bonus cost are recorded weekly and accumulated by departments as direct evidence of financial results obtained.

The Mani System is a comprehensive yet simple plan, first, for accurately measuring labor effort and for checking work standards established against seasonable changes and for cost margins; second, for increasing production and reducing labor costs to a minimum; third, for stabilizing labor and supervision through fairly administered incentives; fourth, for bettering quality of workmanship; fifth, for furnishing complete managerial control of all labor losses; and sixth, for accurately reflecting net savings made.

## Utilization of Operating Economies

CERTAINLY there is a need among industrial executives for a broader understanding and systematic application of the economies of industry. There are, as every engineer knows, great opportunities for economies in balancing and in keeping up to date in equipment, in reducing the daily material production wastes, in restricting labor turnover, and in conservation of labor.

There is also a great possibility of economy in organization concentration—the operation of every man from top to bottom toward the definite results for which the industrial unit is aiming. Nor can the more important economies of industry be satisfactorily obtained except through the methods developed by industrial engineering and the introduction of detailed systems, reports, reward plans, production planning and routing, and constant research methods.—B. A. Franklin in *Management and Administration*, September, 1924.

# SURVEY OF ENGINEERING PROGRESS

A Review of Attainment in Mechanical Engineering and Related Fields

## AERONAUTICS (See also Testing and Measurements)

### Pilotless Airplanes

THE author discusses briefly the recent progress in telemechanics, with particular application to the problem of pilotless flight. This latter is of importance both from a military and a pacific point of view. The author points out the effect that would be produced by sending over a large city ten times a day a fleet of 300 pilotless planes, each capable of dropping a ton of explosives or asphyxiating gases. The cost of the necessary equipment would be reasonable considering the effect produced, while the danger to the operators would be practically nil.

In times of peace pilotless airplanes would be of value for long-distance flights such as the "Cape to Cairo," or that from New York to London. Here pilotless airplanes used for the transportation of mail would be capable of rising to immense heights, so great, indeed, as to make pilot flight impossible. There is good reason to believe that winds of very high velocity prevail at extreme altitudes, so that the planes would be capable of developing speeds relative to the ground of the order of 400 m.p.h. Here again such speeds could hardly be used with human pilots aboard, because of the extreme discomfort that they are apt to produce.

The author considers the question of pilotless flight, i.e., flight governed from a distant source by radio waves, as essentially solved. The problem of interference, either accidental or deliberate, has been essentially eliminated by employment of so-called selectors. The selectivity of waves has already reached such a stage that, according to a report of General Ferrié, a boat controlled at a distance from an airplane flying above it was sent crashing (imitating a torpedo) against the sides of a cruiser whose officers were informed in advance as to what would happen and did their best to put the wireless control of the boat out of commission by the cruiser's own sending.

The next question is in regard to the stability of the pilotless airplane in the air. This problem the author considers to have been solved by the invention of the Sperry gyroscope stabilizer, three such stabilizers being used on pilotless planes. The next problem is automatic control of the plane in starting. Here there is first a danger of excessive "zooming," which would bring on a crash. The next danger is that the plane might attempt to rise before it had developed sufficient speed, which likewise would result disastrously. Anemometric apparatus interconnected with the gyroscopic stabilizers is introduced to obviate this danger. The devices are arranged in such a manner that the plane cannot be set for rising until it has attained the proper speed. To insure safe landing a landing "leg" about 6 ft. long is used, which touches the ground as the plane comes down, cuts out all contacts, shuts off the gas, and progressively puts out of commission the various stabilizing devices. Moreover the arrangement is such that all of this takes place not suddenly but with a sufficient lapse of time so as to obtain a smooth landing. Upon this latter being effected, automatic brakes come into action and stop the plane within roughly 100 yd.

At distances not in excess of, say, 20 km. (12 miles), when it was assumed that weather conditions would remain during the period of flight without change, pilotless airplanes have been sent out controlled exclusively by horo-barometric devices. A schedule of flight was set and adhered to without any intervention by the passenger who carried on the experimental plane merely to protect it from accidents. For example, the following schedule was worked out. The plane was to fly north for 5 min.; then northeast for 4 min.; rise to a height of 1200 m. (4000 ft.); drop bombs at a predetermined moment, and then return to the starting point. In this case the plane was controlled by a clock-operated perforated ribbon governing the operation of the various motors.

The author closes by a somewhat significant remark. "The pilotless airplane offers universal possibilities of a value beyond the scope of imagination. But one has to pay for everything one gets, and here there is offered the menace of a merciless and terrible aerial bombardment, unless indeed secrecy is preserved as to devices that would give France preponderance in the air." (Edmond Marcotte in *Arts et Métiers*, vol. 77, no. 45, June, 1924, pp. 210-214, *dg*)

## AIRCRAFT ENGINEERING

### Light-Plane Competition at Lypnpe

THE light-plane competition at Lypnpe was conducted in a manner which was considered by the participants and the English technical press as extremely and, many believe, unnecessarily severe—so severe, in fact, that quite a number of planes were eliminated in the preliminary trials. Nevertheless nine planes participated in the final and hardest event, the speed trial.

As complete information in regard to the various trials and performances of the entrants is given in the original papers from which this abstract is made, only certain conclusions reached from the consideration of these facts will be reported here.

The tests have shown that the light-plane problem is essentially an engine problem, and the best results were obtained by the planes equipped with the Bristol Cherub engine. While this engine required very careful nursing like all other engines, it was stated that with another year of development work it will give 40 hp. and be as reliable as any high-powered aero engine.

It would appear that there are two ways to attack the light-plane engine problem. One is to go on developing the 1100-cu. cm. high-speed engine until reliability combined with low weight and high power is attained. Another way is to go for a larger engine, say, a 2000-cu. cm., and to limit the piston speed.

The tests were of a character to show clearly what the engines could do. In the take-off test the planes were required to show the shortest distance it would take them to clear a 25-ft. barrier. The prize was taken by a plane which did it after a run from standing start of only 215 yd. In the alighting tests in which the machines were required to clear a barrier 6 ft. high and pull up in the shortest possible distance, the best-performing machine came to rest 66.7 yd. from the barrier. In the low-speed test the slowest machine flew at a speed as low as 37.22 m.p.h. In the high-speed test only two machines were able to finish, the rest having failed because their engines would not stand the strain of doing two sets of five laps each, the greatest top speed having been shown at 70.11 m.p.h. ### Efficient Methods for Burning North Dakota Lignite for Steam Generation

DATA of experiments carried out at the University of North Dakota steam-heating and electric plant, using North Dakota lignite for fuel. The article deals mainly with two methods: the burning of pulverized lignite in suspension, and the burning of raw lignites on non-sifting grates.

Most of the lignites in North Dakota are woody in structure and brownish black in color. They are relatively high in moisture and low in ash content, while the combustible matters are about equally divided between fixed carbon and volatile matter, with the sulphur content usually very small. The heating value is relatively low when calculated on the wet basis, but moisture-free or even air-dried lignites have relatively good B.t.u. values.

Physically the lignites are easily handled. They crush readily in a single-roll crusher, and after crushing they may be conveyed and stored without any particular difficulties. In air drying the larger lumps split up into thin slabs and become quite fragile, so that probably the best size for economical handling for power-plant purposes is a 4-in. or smaller. This may be further crushed at the plant to any required smaller size, as determined by the method of stoking and load conditions on the boiler.

North Dakota lignite on being exposed to heat does not coke, but disintegrates and crumbles to a fine dust, which, when burned on a grate, offers high resistance to air flow and renders uniform fuel bed and air distribution very difficult. Unless great care is exercised in controlling the thickness of the fuel bed and the air pressure, a considerable amount of the fines may be blown through the boiler setting unconsumed.

As regards the use of non-sifting grates and mechanical stokers, the author points out that the improved non-sifting grates cost about twice as much as the common grate. These grates are used in connection with the sprinkling-type stoker or coal feeder, which is relatively cheap to operate, reliable, and fairly efficient, and therefore suitable for small plants. In general, it is said that any non-sifting, forced-draft overfeed stoker that offers little or no agitation to the fuel bed has a good chance in burning North Dakota lignite satisfactorily. Certain conditions as to thickness of bed, size of coal, and draft requirements have to be observed.

The possibilities of utilizing North Dakota lignite in pulverized form are next considered, and the author comes to the conclusion that for the smaller plant the unit system where the coal is burned as it is pulverized without storing is the most economical.

The author proceeds next to the discussion of the burning of the pulverized fuel and states the results obtained with an experimental unit. He comes to the conclusion that lignite when dried to 10 and 12 per cent and pulverized approximately to 40 per cent through a 200-mesh screen is an ideal fuel for burning in suspension. The high content of volatile matter with this moisture reduction and the somewhat fibrous nature of the lignite as compared to the granular appearance of bituminous particles make for freedom of combustion. The increased heating value of the dried lignite also recommends this coal as a fuel for steam production. The original article contains a table giving the average results of a study of the combustion jet along a horizontal plane. (Geo. B. Wharen, Mem. A.S.M.E., Professor of Mechanical Engineering, University of North Dakota, in *The Quarterly Journal of the University of North Dakota*, vol. 14, no. 4, June, 1924, pp. 365-382, e)

## INTERNAL-COMBUSTION ENGINEERING (See also Shipbuilding; Motor-Car Engineering)

### Diesel Engine with Airless Injection and Precompression Chamber

This article first concerns itself with a description of the Deutz motor with airless injection. With horizontal motors the system originally used gave satisfactory results, but only indifferent results were obtained when the same system was applied to vertical motors, in which the path of the fuel jet previous to its reaching the cylinder appears to have been too short. The remedy for this was found in providing the cylinder with a recess, usually of a hemispherical shape.

The performance of the engine as finally developed appears to be quite satisfactory. With fuel having a heating value of 10,000 cal. per kg. (18,000 B.t.u. per lb.) and a load of 360 hp., the fuel consumption per effective horsepower-hour was 224 grams (0.492 lb.) at one-quarter normal load, 168 grams (0.369 lb.) at three-quarters normal load, 167 grams (0.367 lb.) at full load, and 177 grams (0.389 lb.) at 25 per cent overload.

This fuel consumption would indicate a thermal efficiency at full load slightly in excess of 38 per cent. Furthermore this type of

engine presents the advantage that its fuel consumption is to a large extent independent of the load; for example, between half-load and 25 per cent overload the consumption varies less than 7 per cent. A good deal of the credit for the performance of the motor belongs to the hemispherical shape of the combustion chamber, which is practically uniform and offers but little cooling surface; hence the high thermal efficiency, to which the motor adds the advantage of a very high mechanical efficiency—estimated at 85 per cent. Tests carried out by Professor Mayer of Stuttgart show the engine to have considerable flexibility and the ability to carry overloads running as high as 40 to 50 per cent.

The other engine type described is shown in part in Fig. 1; its characteristic feature is that it is provided with a precompression chamber, which is a chamber of comparatively small volume into which a charge of combustible is delivered and ignited spontaneously as a result of compression. This compression, accompanied by a certain amount of combustion, forces a considerable amount of burning fuel into the main combustion chamber which is joined to the precompression chamber by a passage *O* of proper shape and

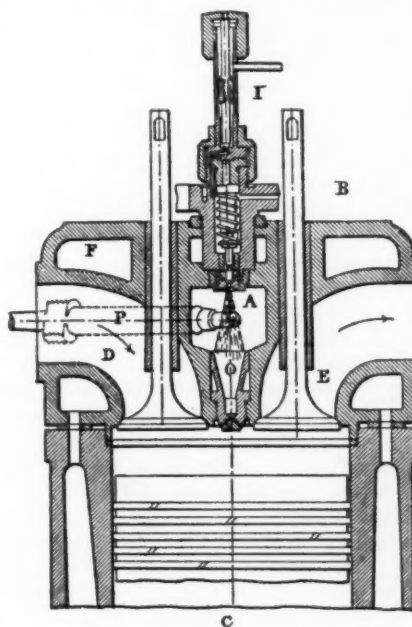

FIG. 1 UPPER PART OF THE CYLINDER OF A DIESEL ENGINE WITH AUXILIARY PRECOMPRESSION CHAMBER

of gradually decreasing section. This transforms the pressure into velocity, and the impetus given to the fluid fuel in its passage from one chamber to the other insures nebulization. It would appear therefore, that the purpose of the precompression chamber is to attain automatically the same results that are secured by the use of compressed air in the ordinary Diesel engine.

As shown in Fig. 1, the precompression chamber *A* opens into the passage *O* with its tapering section. This precompression chamber is cast into the head *B* of the working cylinder and is located between the inlet valve *D* and the exhaust valve *E*. It is, however, also protected by the water cooling jacket *F*, with the exception of the bottom wall where it joins the delivery passage *O*. In its upper part it is equipped with an automatic needle valve located axially to the system *AO*, and the passage *O* to the working cylinder *C* is located in the same axial direction. On the outside the body containing the delivery passage *O* is provided with fins the purpose of which is to retard the flow of heat toward the water-cooled surfaces in the cylinder head. All this causes the precompression chamber to rapidly attain a high temperature, and the jet of liquid fuel when it strikes the hot walls of the delivery passage *O* is made ready for complete combustion equally as well as is the fuel striking the hot wall of a semi-Diesel motor. To start the engine cold the fuel in the precompression is ignited by a roll of nitrated paper *P*. (Prof. Adolf Nagel before the World Power Conference in London, abstracted through *Le Génie Civil*, vol. 85, no. 15, Oct. 11, 1924, pp. 318-319, 2 figs., d)

## MACHINE SHOP

### The Working of Stainless Steel

AN EDITORIAL based on an address by Miss C. Griff, managing director of the Stainless and Non-Corrosive Metal Co., of Birmingham, before a conference of engineering societies held at Wembley.

It would appear from this that while the brands of steel used for cutlery are hard, other brands soft enough to machine are being developed. Even these, however, are not yet always easily machinable, though the blame should not always be placed on the material. An example is cited of a large iron casting which had defied numerous high-speed tool steels to remove its skin expeditiously, until finally a special 18 per cent tungsten tool steel was tried, when a good cut was taken without trouble. It is claimed that had this casting been of stainless steel it would have been condemned as impossible to machine.

Experience in nearly every process of working stainless steels has been gained in connection with the making of an article so simple as a can opener. For this purpose it was decided to use the "Immaculate" brand for the  $\frac{1}{8}$ -in. square top portion, cutting it for the full lengths for the tang and milling the required taper. The idea of forging this out, in order to save material, was tried, but it then required too much heat treatment to get it back to as good a condition for working as it was in previous to forging. Therefore it proved more economical to use more steel than to forge the tangs from short lengths. Provided high-speed drills and cutters are used, no trouble has been experienced in milling and drilling the  $\frac{1}{8}$ -in. square rod as received from the mills.

With regard to the working of stainless-steel sheet, this has been tried for trays and weighing-machine pans. Some sheet rolled down to 28 S.W.G. was stamped and beaded as if it had been tin, without any sign of cracking at the bend. Then came the problem of the removal of scale and the bottoming of the pits in polishing, and it was found that to use cold-rolled sheets was the only satisfactory method. It is stated that in 75 cases out of 100 it is cheaper to pay the extra cost for cold-rolled sheet, for, besides lessening the costly process of polishing, it eliminates the risk of subsequent corrosion. Pickling can sometimes be substituted for cold rolling; it is much less costly, approximately only 1d. per lb. extra on the black hot-rolled-sheet prices.

Incidentally, it may be mentioned that the Stainless & Non-Corrosive Metal Co. allow 15 to 25 per cent more for labor on stainless steel than for the working of mild steel. (*Machinery* (Lond.), vol. 25, no. 627, Oct. 2, 1924, p. 8, p)

## MACHINE TOOLS

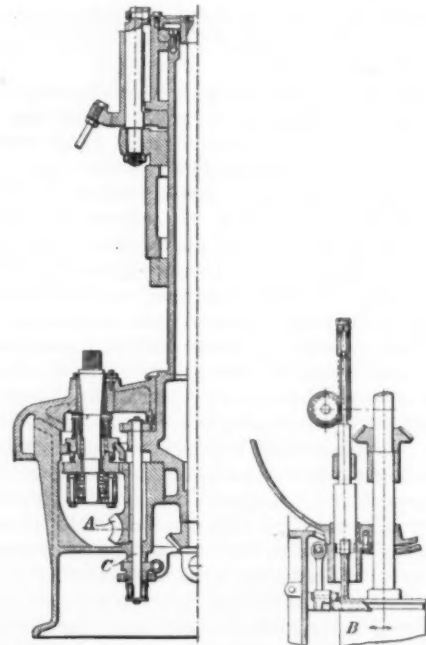

### The Ryder Automatic Vertical Chucking Machine

DESCRIPTION of a new vertical automatic machine for chucking work, shown by Thos. Ryder & Son, Ltd., of Bolton, England, at the Wembley Exposition. The machine accommodates six chucks, on five of which work proceeds simultaneously, the sixth being idle so that the operator may remove the finished piece and chuck in a new one to be machined. The tool will take pieces up to 4 in. by 6 in. The machining is done by five heads on the center turret and two traversing slides. The tool-holding arrangements allow of a wide variety of operations, but all work is done normally at one speed. Change gears, however, enable this to be varied, and in addition it is possible to secure reduction of speed for tapping, etc. by revolving the tap holder; this requires a special gear which normally does not form part of the machine.

The tool has a large revolving table mounted on a box base, with the traversing slides on each side as described above. The table carries the six chucks which hold the rotating work, and is indexed around the center column or turret. The column carries a heavy sleeve on which tools are mounted to correspond with five positions of the work, and the sleeve is fed up and down by a large revolving cam drum at the head of the column. The main drive is by single belt pulley through change and worm gears to a horizontal shaft carrying a worm in mesh with a large wormwheel. This worm is carried on a sleeve mounted on a large boss forming part of the base. At its upper end the sleeve is cut with a spur ring which meshes with wheels on the six chuck spindles. The table is umbrella-shaped so that it clears quickly of chips, while the manner

in which it projects over the sides of the base effectually protects the working parts in the interior. During operations the table is stationary; between operations it is indexed from one position to another.

The indexing motion is shown in plan in Fig. 3, and, in elevation, part of it may be seen in Fig. 2. Taking these together, a revolving drum *B* is utilized to time, by means of a face cam on its end, the stroke of a plunger, an extension of which carries a guided rack. This rack is in mesh with gear wheels on the small vertical shaft *C*, Fig. 2, and the motion imparted by the rack is then transmitted to a pinion immediately under the table. This is in gear with a ring fixed to the table center, and the table is thus caused to revolve. The vertical spindle *C* is provided at its lower end with a ratchet gear, so that the rack stroke is only effective in one direction. Working in conjunction with this rotary table motion is the locating and locking device shown in Fig. 3. A cam on the same drum drives this gear also, being timed to depress the horizontal arm of a bell-crank lever, which motion in turn withdraws

FIGS. 2 (LEFT) AND 3 (RIGHT) INDEXING GEAR OF THE RYDER VERTICAL AUTOMATIC MACHINE

a locating plug and lock from its socket in the table. The lock is spring-loaded and on release shoots into the next table socket as it comes around. The lock and sockets are of nickel-chrome steel hardened.

The principal operation motion is the drive for the traverse of the large sleeve forming the tool slide on the central column described in detail in the original article. This includes a cam which provides for the lowering of the slide and for its subsequent return to its highest station. During the complete revolution of the table the chuck spindles revolve constantly except when each is brought to rest in turn at the last or first station to give the operator a chance to remove the finished pieces and insert fresh ones as the chuck arrives at this point. The chuck spindles are driven by their gears through spring-loaded compound friction and positive clutches. As the spindle approaches the chucking station these clutches are opened by means of cam plates fixed to the body which lift the clutches clear due to flanges, with which they are fitted, running up inclines. The spindle is then stopped and the piece can be removed and replaced. When the rotation of the table is continued the double clutch is lowered again into gear, the friction first engaging and the positive clutch following this up shortly afterward. (*Engineering*, vol. 118, no. 3064, Sept. 19, 1924, pp. 399-400, and a plate of drawings, d)

### British Centerless Grinder

DESCRIPTION of a centerless grinder built by the Birmingham Small Arms Tools, Ltd., of Sparkbrook, Birmingham, differing

materially from the centerless grinder made in this country by the Cincinnati Milling Machine Co. in that the latter makes use of the periphery of the wheel and the other of the fly face of a cup wheel.

In this machine, as stated, a single cup wheel is employed and the work is supported by a roller steady between two blades. A drawing of the grinding wheel and spindle is given in Fig. 5, while Fig. 4 illustrates the work holder. The spindle is carried in bearing rings which are split in one place and adjusted by expander bolts to the desired degree of fit. They are lubricated by ring oilers. The spindle thrust is taken on a bearing consisting of a set of alternating steel and phosphor-bronze plates. At the back end a ball thrust bearing and compression spring is furnished. Sight-feed lubricators supply the ring-oiler wells. Two sizes of machines are made, for 16-in. and 12-in. wheels, respectively. Fig. 5 shows details of the larger. The smaller head is somewhat simplified and the pulley is at the end of the spindle.

In this machine the work is traversed across the wheel face as the result of tilting the work holder. For a coarse feed the tilt is considerable, while for a fine feed for finishing the tilt is slight. The maximum inclination possible is 10 deg., but in practice 3 deg. serves for most purposes, reduced to a

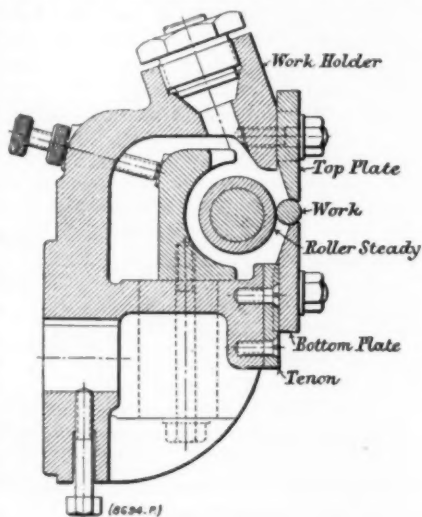

FIG. 4 WORK HOLDER OF COVENTRY CENTERLESS GRINDER

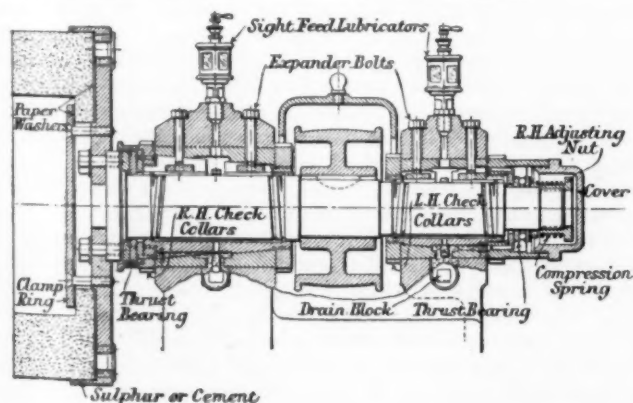

FIG. 5 COVENTRY CENTERLESS GRINDER

minimum for finishing. The roller of the work holder is driven through a telescopic shaft by belt from the pump shaft at the back of the machine, and its speed can be varied to suit different diameters of work. The supporting blades are beveled and are set for the work to project just far enough to be ground without the wheel's touching the plate faces. The wheel is fitted with a diamond truing device, by which a point is traversed across the face, which in the 16-in. wheel is 3 in. wide, and for the 12-in. wheel,  $2\frac{1}{2}$  in. wide. In the larger machine pieces from  $\frac{1}{4}$  in. to  $1\frac{1}{8}$  in. in diameter and  $6\frac{1}{8}$  in. long can be ground by the use of two sets of work-holder blades, while in the smaller two sets of blades make it possible to grind work from  $\frac{1}{8}$  in. to  $\frac{3}{4}$  in. diameter by  $4\frac{1}{2}$  in. long.

For such work as small rollers, gudgeon pins, and other cylindrical parts it is claimed that the time can be cut down with these machines to one-quarter or one-sixth of that for center grinding. (*Engineering*, vol. 118, no. 3064, Sept. 19, 1924, pp. 404-405, and plate of drawings, d)

### Cutting Tools Made of Cast Iron

WHEN only a few pieces are to be turned to a special form it is sometimes possible to cut down the tool expense and still obtain satisfactory results by using chilled-cast-iron tools. A forming tool of this kind provided with a shank that can be gripped in an ordinary tool post is shown in the original article. The upper surface of the formed part of this tool is made very hard by chilling when the mold is poured. When carefully sharpened a tool of this kind which has been properly designed will give good service for a short time, especially in cutting through scale or the tough outer skin of castings. It also gives exceptionally good results in machining phenolic condensation products, which are very hard on steel tools.

In casting it a detachable rectangular piece or print is used, made about 1 in. deep, 1 in. wide, and 3 in. long. This piece has a slight taper or draft which permits it to be easily withdrawn from the mold. A piece of cold-drawn steel 1 in. square by 3 in. long is placed in the cavity left in the mold by the withdrawal of the print. The hot iron flowing into the mold strikes the "chill" and is thus cooled suddenly. The surface that is in contact with the chill becomes glass-hard if kept in contact until fully solidified.

A tool made in the manner described can sometimes be hardened if heated to a bright cherry color and quenched in water. It is, however, difficult to quench the work at exactly the right point; and furthermore the edges of tools made in this manner are very brittle and easily nicked.

The original article contains certain practical instructions for making such tools. (*Machinery*, vol. 31, no. 2, Oct., 1924, pp. 129, 1 fig., p)

### MARINE ENGINEERING (See also Power Plants)

#### Air-Jet-Propelled Launches

BRIEF description of the Schroeder system, which consists essentially of a ship propelled by air ejected below the water line. It is to be applied on a 35-ft. launch for which tenders have been invited by a British engineering firm.

Underneath the ship is a series of grids perforated in such a way that the jets of air, which in this case are being forced through them by a Sturtevant blower driven by a 3-hp. internal-combustion engine, are expelled up under the rising floor which forms a sort of double tunnel astern. It is expected that the air will be expelled at the rate of about 23 m.p.h. and the vessel propelled at the rate of 8 or 9 m.p.h. The system is proposed especially for shallow waters. (*Shipbuilding and Shipping Record*, vol. 24, no. 15, Oct. 9, 1924, p. 431, 1 fig., d)

### METALLURGY

#### Influence of Sulphur, Oxygen, Copper, and Manganese on the Red-Shortness of Iron

THIS investigation was undertaken in order to throw light on some disputed matters as to the elements in iron which cause it to be brittle when worked in a forge or otherwise above a red heat. Sulphur is generally admitted to be a cause of this defect, but data as to the minimum percentage of this element necessary before red-shortness disappears are rather meager. Oxygen has been considered by many metallurgists to be as important in this regard as sulphur. The opinions on the effect of copper are quite variable. Manganese is conceded generally to be a corrective for the red-shortness caused by sulphur, and is thought by many to prevent or help prevent the red-shortness supposed to be caused by oxygen. Data as to the amounts of manganese to be used are given in the literature on the subject, but are in some cases contradictory.

Much of the discrepancy in views regarding the effects of some of these elements is due to studies having been made on commercial steels in which it is difficult to insure that the element or elements studied are the only important ones present. This investigation has therefore been made using electrolytic iron or commercially pure iron as raw material. The melts were small (900 gr. approximately) and made under fairly good control in carbon-helix vacuum furnaces or in a high-frequency induction furnace under air. The copper added was over 99.9 per cent pure and the manganese over 98 per cent. The carbon content of the samples in most cases did

not exceed 0.06 per cent. The ingots were forged to  $\frac{1}{2}$ -in. bars and then tested for red-shortness by bending back and forth over a blacksmith's anvil in a temperature range of 1100 to 500 deg. cent. (2012 to 932 deg. Fahr.). Samples classed as free from red-shortness were those which stood such a test without breaking.

The conclusions of this study are:

1 Sulphur is the principal element responsible for red-shortness. In order to prevent red-shortness in iron not more than 0.01 per cent sulphur should be present.

2 Oxygen in amounts up to 0.20 per cent does not cause red-shortness in pure iron if the sulphur is below 0.01 per cent.

3 Manganese may prevent red-shortness in iron when present to the extent of three times the sulphur percentage if the oxygen percentage is not above 0.04 per cent.

4 The presence of considerable amounts of oxygen in irons (0.10 per cent and above) tends to reduce the efficiency of manganese in preventing red-shortness. The hypothesis is advanced that this is because some of the manganese reported in such irons is present as oxide.

5 Copper (0.05 to 0.5 per cent) is of minor importance in its effect on red-shortness of pure iron, but in some of the specimens described in this paper it tended to decrease the red-shortness. (J. R. Cain in *Technologic Paper of the Bureau of Standards*, vol. 18, no. 261, July 30, 1924, pp. 327, 335, 5 figs., ep)

## MOTOR-CAR ENGINEERING

### Producer Gas as Motor-Truck Fuel

A DESCRIPTION of a number of European devices for operating motor trucks on producer gas, of which only two can be described here on account of space limitations.

The Etia gas producer operates on charcoal with steam injection and is an improvement on the Parker producer. Among other things, it is so designed as to contain enough fuel for several hours, and also has a charging hopper. The ashpit of the generator supports the whole apparatus and is a sort of a circular casing. Inside it is formed by a double perforated cone. Above it is the furnace, a hearth lined with graphite, which insulates it from the air. This furnace is surrounded by a metal sheet provided with passages to permit the entrance of the air of combustion. In the lower part are located the grate and ashpit, the former being capable of oscillating and rotating. The gas produced goes into a device which frees it of dust and into a cleaner designed with the special view to lightness. These apparatus are formed of two sheet-iron cylindrical bodies, one enclosing the other. The gas descends into the annular space between the two apparatus, passes the lower part while it is rising and goes into a pipe which leads to the cleaner and washer. The air of combustion in its turn passes through a nest of tubes which cross the heat recuperator.

The washer consists of a bed of coarse gravel placed on a perforated sheet or special grate and the gas is forced to pass through it in an upward direction. The perforated sheets break it up into fine bubbles which insure good cleaning, while the entrained water is retained in the gravel bed. The gas producer operates with the assistance of the steam which is added to the air admitted to the generator. This steam is provided by a little furnace incorporated into the dust eliminating apparatus (Fig. 6).

Among the other apparatus described in the article (Autogaz, G. P. A., Lion, Imbert, and Berliet), the Renault unit deserves particular mention both because of its construction and also because of the company that stands back of it. In this case the apparatus consists of three parts: a furnace, a gas suction chamber, and a fuel reservoir.

The furnace is of a portable type and consists of a sheet-iron case connected with the suction chamber by four bolts. Inside it is provided with eight elements made of refractory brick, the edges of which have angular tongues and grooves so that the pressure produced by the bolts which hold the unit together forces the bricks against each other and insures the airtightness of the furnace even though no mortar is used. Instead, a sheet of asbestos board is placed between the bricks. Because of this construction the furnace can be installed or dismantled very easily.

Beyond the furnace is located a cast-iron grate capable of oscillation on three supports, which permits its rapid cleaning.

A centrifugal gas cleaner is used. This consists of a turbine fan,

the gas entering at the center and being carried to the periphery where it acquires a high circumferential velocity which, in turn, throws all foreign matter, even the finest, against the outer wall. The matter which is projected against the wall is carried off by a small stream of water properly projected. The injection of water produces also a freshening action on the gas and a precipitation of any tarry matter it may contain. The gas comes out of the apparatus through a hole located along the central axis of the device, which prevents foreign matter from coming back with it.

Notwithstanding the efficiency of the cleaner and the great care taken, a certain amount of dust is carried along by the gas and ultimately reaches the motor. Some of this dust is carried out with the exhaust, but the rest gets caught in the lubricating oil and this, if not attended to, will result in rapid wear of the engine parts. To prevent this the engines are equipped with an oil regenerator which forms an indispensable part of the gas-producer-motor prime mover. This regenerator consists of a vessel rotating at a very high speed, 4000 to 5000 r.p.m. The oil arrives from the oil pump at the center of the vessel and is conveyed to the periphery where the

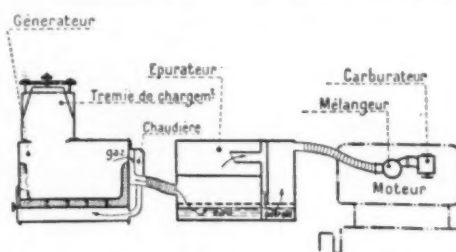

FIG. 6 AUTOGAZ GAS PRODUCER

(Générateur = producer; chaudière = boiler; tremie de chargement = charging hopper; epurateur = cleaner; mélangeur = mixer; eau = water; pétrole = gasoline.)

circumferential velocity is at a maximum. The foreign matter is eliminated by centrifugal action.

The operating characteristics of producer-gas engines were rather discouraging at first because of the reduction of engine output as compared with gasoline engines of the same size and trouble from dirt on spark plugs and cylinders due to the presence of dust in the gas. The former was obviated by resorting to an increase in compression ratio, and the latter by a better cleaning of the gas and by oil regeneration. Heat recuperation from gas coming out from the producer makes it possible to employ high temperatures, which permits increasing the hydrogen content in the gas, while the heat economy brought about by recuperation makes producer operation at high temperature feasible and economical.

A car equipped with such apparatus (Autogaz) has been in operation for two years in Morocco doing regular work and carries an Arabic inscription which, translated, reads, "Transportation from Casablanca to Marrakech, by the Grace of God." A small 18-hp. car has been running for a year in Madagascar, making regular trips of 50 kilometers (31 miles) with numerous stops. Other instances where gas-producer-operated motor cars exhibited satisfactory reliability and operation are cited. (E. Weiss in *La Nature*, no. 2635, Oct. 4, 1924, pp. 214-221, 12 figs., d)

## POWER-PLANT ENGINEERING (See also Railroad Engineering)

### Aluminum-Coated Grate Bars

THE common grate bar as used in the furnaces of marine boilers does not at first sight appear to be amenable to any considerable degree of improvement, but experiments carried out on a number of German vessels appear to indicate that by the simple expedient of coating it with aluminum a definite improvement is obtained. In one plant on land where the aluminum-coated bars were tried, no change was noticeable after the bars had been in service for six months, whereas ordinary bars installed in the same furnaces had suffered losses of about one-fifth, due to burning, and had to be renewed. The main advantage of the coated bars, however, consists not so much in their longer life as in the fact that the working of the fires is so much easier. With ordinary grate bars it is found that at a temperature of between 800 deg. and 900 deg. Fahr. clinker is formed, which sticks to the bars, thus impeding the flow

of air, lowering the efficiency of the combustion, and causing the temperature of the bars to rise still further. With the aluminum-coated grate bars a coating of aluminum oxide is formed which does not melt below a temperature of 2300 deg. fahr., and the clinkers thus do not stick to the bars as the temperature is always below this figure. The air passages thus remain clear, and the cleaning of the fires is much easier. A special process is employed for coating the bars with aluminum and they are more expensive than ordinary grate bars, but the greater cost is, it is stated, more than compensated for by the longer life and the lower fuel consumption obtained. (*Shipbuilding and Shipping Age*, vol. 24, no. 15, Oct. 9, 1924, p. 419, d)

### The Stal Boiler Unit

DESCRIPTION of a unit comprising a combined boiler, superheater, economizer, and air heater, built by the Stal Turbine Co., of Finspong, Sweden, and designed primarily to be used in connection with the Stal-Ljungström turbine as the latter is especially adapted for the utilization of steam at high pressures and temperatures.

When the working pressure of the steam is increased the boiler must be designed with the utmost care as to the elastic limits of its elements. The proper circulation of the water is another factor which must be carefully considered.

In the design of the Stal sectional-type boiler due attention has been paid to the following points:

The two separate headers are arranged in staggered position, and in this way kept closer; the distance between the sections can be considerably diminished so that the number of sections and also the number of connections for the water circulation will be increased for a certain width of the boiler.

Owing to this arrangement the area of the connections between the boiler drum and the sections will be 40 to 50 per cent greater than in a corresponding sectional boiler of the usual type, provided that the tube diameter and floor space are the same in both cases.

The double-row headers also allow a staggered spacing of the boiler tubes, so arranged as to provide as far as possible a constant gas velocity, determined so as to obtain the highest possible heat transmission with comparatively low draft loss.

As the distance between the tube rows is decreased, the tubes could easily be so arranged that the gases would come into contact with practically the whole tube circumference, as is clearly seen from the cross-section in Fig. 7.

The area of the circulating tubes being increased and the resistance thus decreased, it follows

that the circulation will be more free and rapid; consequently the evaporation and efficiency of the boiler will be increased. The risk of local overheating also will be minimized.

Both the air and water heaters are arranged above the boiler. In most cases, however, it would prove less expensive to utilize either an air heater or an economizer of correspondingly larger dimensions to absorb all the available heat in the flue gases. The air heater is very suitable in case the feedwater has a very high temperature, making it impracticable to absorb much heat from the gases. The water-heater or economizer tubes at the feed end and the headers are placed in a horizontal position, one above the other. The combustion air is taken from the top of the boiler room, thus utilizing its heat.

The Stal boiler is built in all the usual sizes and for pressures up

to 800 lb. per sq. in. A boiler designed for 600 lb. per sq. in. and 750 deg. fahr. has been in use in the company's works since 1919. The article presents results of three tests. (Boilers, Superheaters and Economizers. *Serial Report of the Prime Movers Committee* 1923-1924, Technical National Section, National Electric Light Association publication no. 24-74, September, 1924, pp. 14-15, 2 figs., d)

### The Legal Side of Smoke Abatement

A COLLECTION of data on the police power as embodied in laws, ordinances, and court decisions for the regulation of the smoke nuisance in American cities and states.

It would appear that smoke was not considered a nuisance at common law until the decision of Chancellor Coke about 1616 in the Aldred case, when it was declared to be a nuisance against which a court might issue an injunction and the aggrieved person might recover damages.

The growth of the police power kept pace with social growth. In very recent times legislatures have extended it in many directions specifically by delegating power to pass ordinances to control smoke and to outline methods for its abatement.

The English law deals with smoke abatement as a health measure and places the enforcement of the law in the hands of the health departments of the various municipalities or parishes.

In the United States the department which shall enforce it is designated in the ordinance itself. It has been placed under the supervision of many departments. In New York, Chicago, Baltimore, and some other cities it is under the supervision of the health department. In Philadelphia it is under the boiler-inspection department. In Denver the building inspector performs the duties required by the ordinance. In Cincinnati it is an independent department. In Columbus, Ohio, it is a division of the department of public safety. In Toronto, Canada, the department of public property has charge of smoke regulation.

During the World War there was a general let-up in the enforcement of smoke-abatement ordinances. The available coal was of a poor grade and the constant order and demand from Federal sources was for increased production. Even after the war the effort toward readjustment, and the unsettled conditions of mining labor and of the coal market up to within a year or so, made the rigorous enforcement of smoke ordinances generally impracticable and inadvisable.

A typical history of smoke abatement in American cities is illustrated by the case of St. Louis, Mo. The first time the question of smoke nuisance was raised in that city was by a private suit at law, the famous case of Whelan vs. Keith, brought before a justice of the peace in St. Louis, and ultimately carried to the State Supreme Court. The defendant claimed that if the shed upon which the smoke is alleged to have escaped was entirely upon the premises of the defendant and no smoke pipe encroached or was carried off, on, or into the premises of the plaintiff, the plaintiff is not entitled to recover. The State Supreme Court found, however, that the evidence showed that the plaintiff was injured by the defendant's negligent or willful misuse of his property, although neither the shed nor the smoke pipes projected over or into the plaintiff's property. Possibly as a result of this case the first smoke-abatement ordinance in the State of Missouri, and one of the earliest in the United States, was passed. This did not directly prohibit the emission of smoke but ordered a minimum height of smokestack above adjoining buildings, which, in effect, was equivalent to a smoke-abatement measure. More than 25 years later ordinances were passed to prohibit explicitly the emission of dense black and thick gray smoke and declaring the latter a nuisance. These ordinances were sustained by the courts.

Ordinances alone do not make cities free of the smoke nuisance. Thus, for example, in Baltimore, Md., notwithstanding that a smoke-abatement ordinance was passed 18 years ago, no convictions have been secured. The ordinance placed the power to abate the smoke nuisance with the commissioner of health. Under the ordinance he can bring suits against offenders, and during the early days when it was first passed the commissioner did so, but ineffectively. In later years no efforts have been made to enforce the ordinance. This may be due to indifference or to lack of general interest or to a bad ordinance, and, as a matter of fact, the smoke-

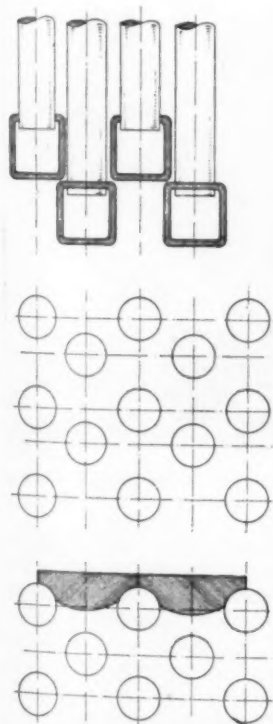

FIG. 7 CROSS-SECTION SHOWING TUBE AND HEADER SPACING IN NEW STAL SECTIONAL BOILER

abatement ordinance of Baltimore appears to be one of the weakest in the United States both in its general construction and in the fact that no restriction is placed on the smoke emitted from the furnace of any manufacturer. Moreover, courts have decided that municipalities may not be made defendants in suits because of neglect to enforce certain ordinances, which means that municipalities cannot be compelled to enforce ordinances.

An effort to put teeth into the smoke-abatement ordinance was made in 1913 with the aid of the Women's Civic League. This met the opposition of the mayor of that day, based on the expressed opinion that manufacturers would not locate in a city where an anti-smoke ordinance was in force.

A general survey of the situation would indicate that, in the large cities especially, the efforts toward smoke abatement are either lukewarm or fail in producing results. This is the case, for example, in such large cities as Buffalo, Chicago, Detroit, and Pittsburgh. There are a few cities where a more earnest effort to control the situation is made, for example, Cincinnati, Ohio, and Milwaukee, Wis. New York, partly because its fuel has been largely anthracite, also belongs to the class of cities where the smoke situation is in general satisfactory.

On the other hand, there are a few places, chiefly small ones, where the smoke nuisance has been solved. Among these is the village of Wilmette, Ill., where smoke offenders are promptly prosecuted and the village is approximately free from smoke. Anthracite coal is generally used, even though during the last two winters it cost \$17.85 a ton. The following ordinances may be cited as an example for others:

*Section 886. Dense Smoke a Nuisance.* Section 7: The emission of dense smoke from the smokestack of any locomotive, or from any chimney or smokestack anywhere within said village, shall be deemed, and is hereby declared to be, a public nuisance.

*Section 887. Smoke Nuisance. Penalty.* Section 8: The owner or owners of any locomotive engine, and any person or persons employed as engineer or otherwise, in operating such locomotive, and the proprietor, lessee, or occupant of any building, or the person in charge of the furnace therein, who shall cause, permit, or allow dense smoke to issue or be emitted from the smokestack of any such locomotive or stationary furnace or the chimney or smokestack of any buildings within the corporate limits, shall be deemed and held guilty of creating a nuisance.

Some data on smoke abatement in foreign cities are cited and a bibliography of the subject is appended. (Lucius H. Cannon, Librarian, Municipal Reference Library, St. Louis Public Library, St. Louis, Mo., in *Smoke Abatement*, publication of St. Louis Public Library, Aug.-Sept., 1924, 319 pp., illustrated, g)

## RAILROAD ENGINEERING

### Electric Locomotive for the Detroit and Ironton

DESCRIPTION of a new type of electric motive power adopted for use on the Ford Railroad, The Detroit, Toledo and Ironton. In this case trolley power is supplied at 22,000 volts (twice as high as any previously used in this country) by 25-cycle alternating current. This is delivered to a transformer feeding into a single-phase motor, which in its turn drives a direct-current generator supplying power to eight axle-hung direct-current series-type traction motors. The alternating current is conducted through an oil circuit breaker to the primary side of the transformer. The direct current, which can be regulated from zero to 600 volts, is delivered by the motor-generator set to the traction motors connected permanently in parallel.

The use of such a combination permits employing an economic form of transmission from the central generating station and yet be entirely free from such troubles as surges encountered in alternating-current operation. The system used also permits employing a rugged electrical construction of the motors. There are further possibilities for the simplification of the mechanical parts due to the high space and weight efficiency obtained in the traction motors. (Fred Allison, H. L. Maher and L. J. Hibbard (Assoc. Mem. A.S.M.E.), in *Railway Age*, vol. 77, no. 16, Oct. 18, 1924, pp. 685-686, 1 fig., d)

### The First Krupp Turbine Locomotive

THE Krupp Co., of Essen, has completed the first turbine locomotive in Germany employing a steam condenser. Externally the

turbine locomotive does not materially differ from the reciprocating engine locomotive except in its cleaner lines and greater lack of cumbersome details, as would appear from an illustration in the original article. In the forward part of the locomotive frame is located the turbine and transmission-drive aggregate, the size of which appears from Fig. 8. The turbine unit consists of a forward and reverse turbine located in separate housings at the two ends of the gear drive, the forward turbine being at the right, looking in the direction of drive, and the reverse turbine at the left. The turbines are of the Zoelly type and have been supplied by Escher-Wyss & Co., and run at 6800 r.p.m., developing 2000 hp. at a train speed of 80 km. (50 miles) per hr. Both turbines are coupled to the layshaft of the drive.

The lubrication of the turbine bearings and gear driveshafts and teeth is supplied by a gear-driven oil pump located on the left side of the locomotive and driven directly from the gear driveshaft. The oil from the turbine passes through an oil cooler which is supplied by water from the circulation pump of the condenser.

The steam from the turbines exhausts to a surface condenser located immediately back of the turbines and connected thereto. In addition to this the exhaust chambers of the forward and reverse turbines are interconnected by a large pipe so that a part of the exhaust steam of the turbine that is in operation (i.e., the forward or reverse as the case may be) passes through the casing of the idle turbine and then reaches the condenser. This arrangement is used in order to get the steam to distribute itself as evenly as possible

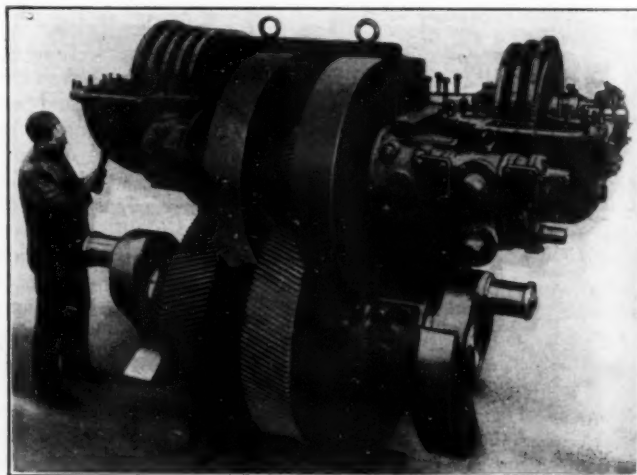

FIG. 8 MAIN TURBINE AND GEAR-DRIVE SET OF THE KRUPP TURBINE LOCOMOTIVE

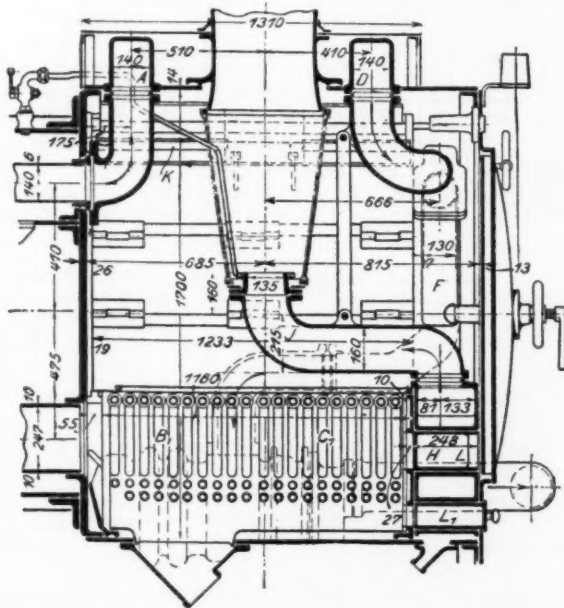

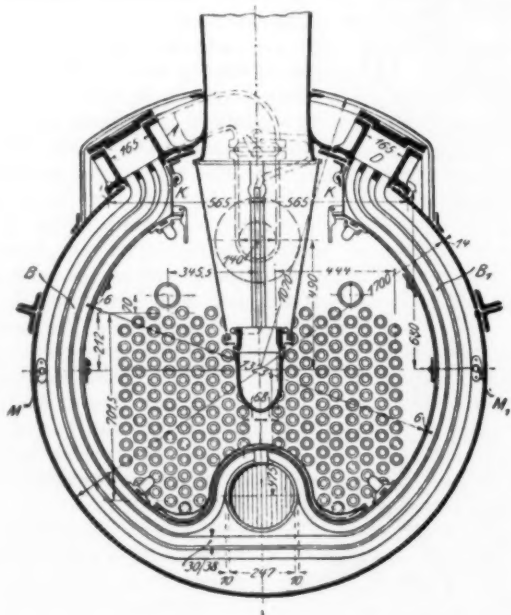

through the various sets of the condenser tubes. The condenser itself is divided into two cylindrical chambers located one back of the other and connected by flexible pipes. This division was decided on for erectional reasons, as it is easier to install on a locomotive two cylindrical condensers and the weights are smaller than would be the case with a condenser of the usual rectangular cross-section. The steam which is not condensed in the first condenser goes together with the air into the second condenser where it is condensed, the air is removed from the upper part of this condenser. The condensers carry at their outer ends water chambers interconnected by the condenser tubes. The cooling water flows first through the first condenser so that the steam as it enters the condenser comes at once in contact with the coldest tubes. From there the water flows to the second condenser and then to the cooler. Both condensers are arranged in such a manner that their tubes are fully accessible as soon as the covers on both sides are removed. The tubes are not rolled in.

Back of the condensers are located the auxiliary apparatus consisting of cooling-water circulation pump, feedwater pump, and air compressor for the brakes. These auxiliary devices are driven by an auxiliary turbine supply with live steam and delivering the exhaust into the main condenser.

The boiler is of standard locomotive construction except as regards the smokebox, which is divided into two parts which are separated by a double door.

The original article shows an interesting picture of the cab of the turbine locomotive with its gages, which unfortunately cannot be reproduced for technical reasons.

The condenser-water cooler is located in the rear part of the tender and consists of individual cooler cells set in four rows one above the other and in several rows side by side. In the middle of the cooler unit is located a fan (shown in the original article) which divides the cooling unit into two parts. This fan draws in the air from both sides through the cooler units and forces it out into the open. The individual cooling cells contain Raschig rings. These are thin sheet-iron rings of about the same height as their diameter. Being simply dumped in, they are all irregularly distributed. The water coming from the condenser flows over them in a state of fine subdivision. Air is drawn in through the mass from below through a number of openings in the side wall, and because of the irregular distribution of the rings a powerful turbulence of the air takes place, resulting in intimate contact between the air and water.

FIGS. 9 AND 10 THE SCHMIDT SMOKEBOX SUPERHEATER  
(All measurements in mm.)

The cooled water is collected in special chambers and delivered to a container at the bottom of the tender by vertical pipes. From this container the water is picked up by a circulation pump. The installation is capable of absorbing 6,000,000 cal. per hr. at an air temperature of 30 deg. cent. (86 deg. Fahr.).

While no data of tests are presented, it is claimed that the coal consumption of the turbine locomotive is from 20 to 30 per cent lower than that of a reciprocating-engine locomotive. From another statement in the original article it would appear that the first cost of the turbine is considerably higher than that of the reciprocating-engine locomotive. (*Kruppsche Monatshefte*, vol. 5, Aug.-Sept., 1924, pp. 129-136, 8 figs., dA)

#### Locomotive Superheaters

LOCOMOTIVE superheaters must satisfy the following three essential requirements: (a) They must heat the steam in an economical manner to the desired temperature, 350-380 deg. cent. (662 to 716 deg. Fahr.); (b) With a moderate first cost they must show a moderate cost of maintenance, while the life of the equipment must be as long as possible; (c) The construction of the superheater must be such that it will be neither inaccessible itself nor affect the operation of parts of the locomotive or make them inaccessible, a requirement that is not easy to fulfil in view of the crowded character of the space on a locomotive. What the author does next is to proceed to examine the various types, twelve in all, of superheaters used or tried on German railroads.

The Schmidt furnace-flue superheater is the first to be discussed because it was the first to be more or less successfully tried. This superheater did not give entire satisfaction because the steam pas-

sages were excessively restricted, which resulted in excessive velocity of the steam combined with a very strong drop in pressure. The velocity of the gases in the large pipes must have been also very high, with an accompanying high temperature of the exhaust gases. Furthermore, the requirements (b) and (c) were not satisfied because it did not prove possible to keep the furnace flue tight while in operation.

The furnace-flue superheater was therefore replaced by the Schmidt smokebox superheater (Figs. 9 and 10). Here the cross-sections of the steam passages were made large enough to hold the drop in pressure within reasonable limits while maintaining a sufficiently high steam velocity. The economic results on locomotives equipped with these superheaters were entirely satisfactory, and on running overload (as was inevitable with the comparatively small locomotives used) steam temperatures in excess of 380 deg. cent. (716 deg. Fahr.) were obtained. The steam passages were so arranged that over about half of its path the steam flowed in counter-

current to the gases, this being done in order to improve the heat transfer. Unfortunately, however, the life of this construction proved also to be short, because of the difficulty of maintaining the 250-mm. (10-in.) flue tight.

As soon as the troubles with the furnace flue were properly understood, an effort was made to eliminate them by decreasing the pipe diameter through a return to the longitudinal location of the superheater units. Essentially the endeavor has succeeded and resulted in the standard construction of the large-pipe superheater of the German State Railways (Figs. 11 and 12) which has been adopted nearly everywhere abroad with scarcely any changes. Here the steam flows with three reversals through 180 deg. in four tubes located in a single fire tube.

With this arrangement it has proved to be a comparatively simple task to obtain suitable steam and gas velocities for ordinary boiler lengths by properly dimensioning the diameters of the steam and fire tubes.

The success of this type had a good deal to do with the establishment of the general popularity of the fire-tube superheater. It also led to the discussion of the question as to the zone in which the process of superheat should be located, a question which the author discusses in some detail. The experimental work carried out with this in view is also briefly described.

Superheaters of an entirely different character from those described above are represented by the box type, of which the Pielock and Esslinger are mentioned especially. Of these the Pielock (Figs. 13 and 14) has a box inserted into a cylindrical boiler through which pass all the fire tubes, and the arrangement is such that the steam guided by baffles travels the longest possible way, crosswise

to the tubes, and circulates around them. With this superheater only steam temperatures of 230 to 260 deg. cent. (446 to 500 deg. fahr.) can be obtained. The trouble is due to the fact that the velocity of the steam freely flowing around the tubes was much too small to insure proper heat absorption. The transfer took place in cross-flow, while the hot gases were led straight along. Furthermore, the Pielock superheater could not be located in the region of the greatest temperature difference, because if this were done the superheater tubes not cooled by water would be rapidly raised to a white heat and destroyed.

The Esslinger box superheater is based on the same idea but

extent than the stream of gas in the inner pipe which is cooled by the steam only and moves in parallel flow with the steam. The result of this is that too little heat is removed from the inner stream of gas and it escapes at too high a temperature. A test on a small scale with a single unit has shown that the thermal efficiency of this type is no better than that of the standard type.

Two other superheaters described in the original article, namely, the Dauner and the superheater built by the German Evaporator Co., seek to solve the problem by concentrating the superheater surface in the hot zone, while only the inlet and outlet pipes are located in the forward part of the fire tube.

Neither of these designs has shown any clear advantages during tests. A design somewhat similar to Dauner's is embodied in a Swedish superheater built by the Uddeholm Tube Co.

Extensive tests were made with superheaters on German locomotives. As originally installed, the superheater on one of the locomotives gave a temperature of only 300 to 320 deg. cent. (572 to 608 deg. fahr.). The superheater surface was then increased by installing additional units and some other changes, were made which resulted in the temperature of superheat being raised to 340 deg. cent. (644 deg. fahr.). The most important factor which contributed to the better performance was the shifting of a part of the superheater elements into the hot zone. It was also

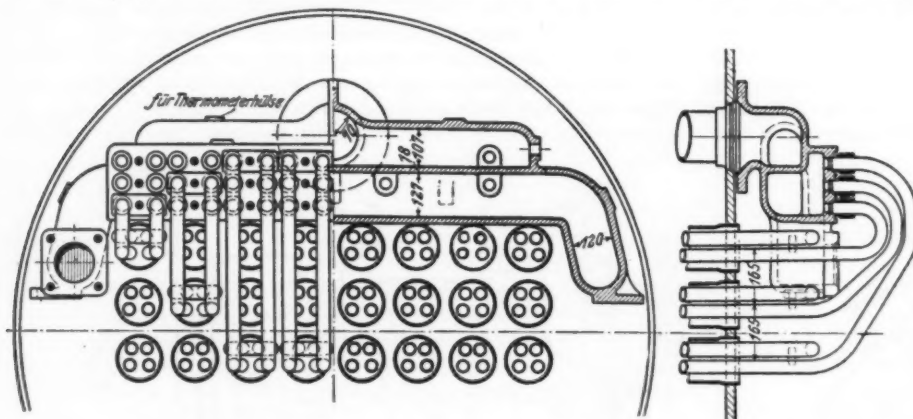

claimed that the installation of additional tubes resulted not only in the increase of heat transfer, but also in the increase of the cross-section of the steam passages, which permitted an increase of velocity of the flow of steam.

The author points out the necessity of properly proportioning of the fire tubes so that they will permit maintaining a suitable velocity of the gases. He further points out that the best results were obtained when the ratio  $F/Q$  was 400 to 420 ( $F$  in square meters is the sum of the areas of walls where gas friction occurs, and  $Q$  in square meters

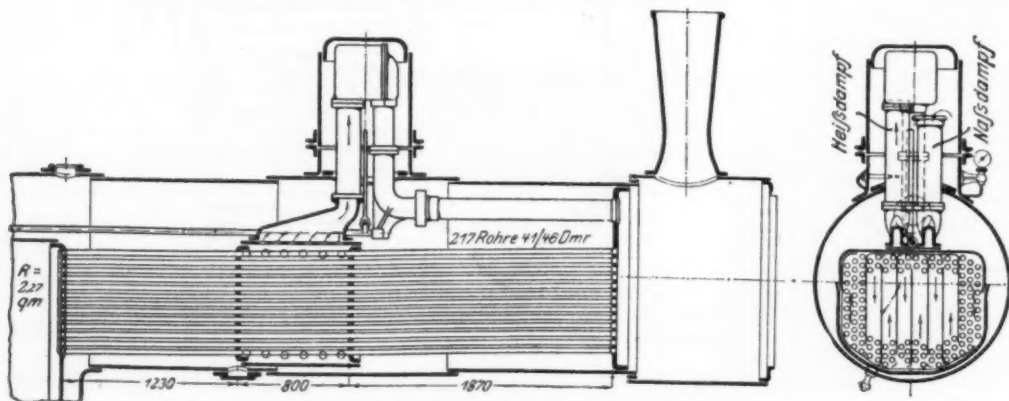

is the free cross-section of the tubes). (R. T. Wagner in *Zeitschrift des Vereines deutscher Ingenieure*, vol. 68, no. 37, Sept. 13, 1924, pp. 951-956, dca)

#### Recent Developments in Locomotive Design in Germany

IN GERMANY as elsewhere strenuous efforts are now being made to increase the efficiency and economy of locomotive operation by the use of superheat, feedwater heating, and the employment of higher temperatures and pressures, as well as the use of condensation. At first considerable difficulties were encountered in the employment of condensation because of the lack on locomotives of cooling water and the restricted possibilities of granting it the necessary space and weight, and because of the use of steam for increasing the stack draft. Most of these have been largely overcome and numerous classes of condensers have come up for consideration for use in locomotives. The author classifies them in accordance with the degree to which the steam, water, and air are intermixed or kept apart. Jet condensers with evaporation coolers are suitable for reciprocating-engine locomotives as the feedwater is already somewhat contaminated notwithstanding the use of oil separators, and further contamination through addition of impurities from cooling air is not so objectionable. The unit is also very light and may be placed close to the steam cylinders. It has not been used on locomotives, however, because of the fear of what might happen as a result of bringing oil into the boiler, even though small amounts of

FIGS. 11 AND 12 THE SCHMIDT SMOKE-TUBE SUPERHEATER  
(All measurements in mm.; für thermometerhülse = for thermometer plug.)

FIGS. 13 AND 14 THE PIELOCK SUPERHEATER  
(All measurements in mm.; Rohre = tubes; heissdampf = superheated steam; nassdampf = wet steam.)

applied in another way, and is noticeable for its good structural design. In this superheater the cylindrical boiler is "interrupted" by the superheater chamber; thus making it consist of two nests of fire tubes located in series with a smokebox in between the two. The superheater tubes are set in a winding manner crosswise through the box so as to be impinged upon by the gases flowing crosswise. With this construction also no very high temperatures have been obtained, 280 deg. cent. (536 deg. fahr.) being about the limit. Even though the steam was properly led, the gases in the box had a comparatively low velocity and therefore gave up only a small amount of their heat. Here also it proved to be difficult to locate the superheater in a zone of high temperatures as then the rear nest of fire tubes became too short (only 400 mm. or, say, 16 in.) and stiff, and this affected the life of the tube walls; the cooling of the box walls also became difficult.

The author proceeds to a description of several types of superheaters in which an attempt was made to use tubes of comparatively small diameter. None of these seems to have given satisfaction, so that the German State Railways appear to have come to the conclusion that their efforts should be limited to developing the standard type with large tubes. In this connection the author mentions other designs, such as the Platz-Jakobsen, in which the steam is led back and forth through a fire tube in two concentric tubes. The structure is such that the stream of gas between the fire-tube wall and the inner tube leaving the steam bath is cooled to a greater

oil cannot do much harm in the boiler and, as a matter of fact, on some railroads oil is deliberately introduced into the boiler to make scale more brittle.

Jet condensers with surface cooling are rather difficult to use because of the large surfaces required, but they avoid the loss of water encountered in evaporator coolers. This advantage is not of sufficient importance to justify the use of this type on locomotives.

The surface condenser with evaporation cooling is the type used in the Krupp turbine locomotive. The condenser is set as close to the turbine as it can be in order to make the very large exhaust piping as short as possible. The feedwater is here free from oil and the contamination of the cooling water is harmless.

The surface condenser with surface cooling is a type in which the intermediary member of the cooling-water equipment can be eliminated when, as in the Ljungström turbine locomotive, the cooler and condenser are combined in a single unit. In order to avoid excessive length of piping the turbine has to be located in immediate proximity to the cooler, and both must be on the same running gear—which is contrary to the usual practice in which the boiler and prime mover are on the locomotive and the cooler on the tender.

From this it would appear that generally the surface condenser with evaporation cooling is the most suitable type, although the Ljungström surface cooler has given very remarkable results.

Essentially condensation is applicable to both reciprocating and turbine locomotives. A three-cylinder uniflow locomotive has been built with a cylinder bore of 750 mm. (30 in.) and given an output of over 2000 hp. with a piston speed of 5 meters (16.4 ft.) per sec. The uniflow engine is here fully applicable because of the great pressure head, and the condensers are smaller because the exhaust steam pressure and the temperature head are large as compared with the cooling air.

The maximum torque of the steam turbine at starting is about twice as great as at the optimum velocity, and from this it would appear that the use of reduction gearing or electrical transmission is unnecessary. On the other hand, the steam consumption during the period immediately after starting is very high, but falls off on reaching the critical velocity to that of a reciprocating locomotive, and when the velocity increases still further, goes below it.

The reliability and efficiency of reduction gearing is such as to satisfy all practical requirements. The problem of reverse drive has not been satisfactorily solved. Ljungström uses for this purpose an intermediary member in the reduction gearing, a method which may be questioned. Krupp and Zoelly use reverse turbines which are only big enough for maneuvering. From the practice employed in Diesel locomotives it seems possible that ultimately the turbine shaft will be located along the longitudinal axis of the locomotive and the drive shaft will be driven through two sets of bevel gears, some kind of a coupling, for example, magnetic, being employed to connect either one or the other set of gears, depending on the direction of motion.

The resort to higher pressures requires also the use of higher steam temperatures, but in the case of the turbine there is no difficulty in their employment as far as the prime-mover elements are concerned. The situation is somewhat less satisfactory in regard to the boiler and superheater. The employment of higher pressures and temperatures requires that a superheater be located in the flue or what corresponds to it. The high-pressure superheater has to be supplied with really hot gases in order to make it possible to attain with certainty a steam temperature of 400 deg. cent. (752 deg. Fahr.). This and the fact that it is impossible to build a Stephenson-type boiler to operate safely at a pressure of more than 20 atmos. (280 lb.), make it necessary to resort to the development of new types of boilers; and it would appear that only water-tube boilers can be here considered, as they permit locating the live-steam superheater at any place where the desired temperature conditions are present and also permit building the furnace in such a manner as to make the employment of pulverized fuel possible. This latter is important because of the great desirability of using low-grade fuels and semi-coke on locomotives. Water-tube boilers can be used in the restricted space available in locomotives only provided essentially pure feedwater is used. This requirement may be fully satisfied by the employment of surface condensers.

Side by side with improvement in steam utilization goes increase

in boiler efficiency. Steam condensation makes it necessary to add to the usual locomotive auxiliaries machinery for driving the suction blower, the cooling-air fan, and the air and cooling-water pumps. The exhaust steam from these auxiliary apparatus becomes available at various pressures and is used by Ljungström in accordance with the range of pressures for gradually preheating the feedwater up to a temperature of 140 deg. cent. (284 deg. Fahr.).

Ljungström also uses the exhaust gases for preheating the air of combustion, not so much in order to increase the combustion temperature as to protect the exhaust-gas blowers by lowering the temperature of the exhaust gases.

The development of the steam locomotive lies apparently in the direction of quite a complicated plant, which may, however, be made quite reliable notwithstanding this complication provided the questions of attendance and maintenance are properly handled. As a matter of fact, simplicity and ease of maintenance by no means always go hand in hand. From the heat-economics point of view modern developments should result in a material improvement of thermal efficiency, say, from the present value of 15 per cent to about 20 per cent.

The author proceeds next to the discussion of internal-combustion locomotives and describes briefly several types, none of which, however, seem to have given satisfaction. He points out, though, how in some designs an approach to satisfactory performance is reached by the employment of gear drives with magnetic couplings and balancing weights. At the same time he calls attention to the fact that in Germany, at least, the prospects of the Diesel locomotive do not appear to be very bright because of the comparative lack and high cost of liquid fuel.

He mentions finally the hydrogen locomotive, for which gas is produced by the electrolytic decomposition of water. The idea is to produce hydrogen in this way, using current from central stations during their slack periods, and to carry it in containers on the locomotive. The hydrogen is used simply as fuel to make steam. The author presents calculations which show that under these conditions a sufficient price could be charged for the hydrogen gas to make its production worth while as an off-peak load for central stations under certain conditions. (Prof. F. Meineke in *Zeitschrift des Vereines deutscher Ingenieure*, vol. 68, no. 37, Sept. 13, 1924, pp. 937-942, 13 figs., etc.)

## REFRIGERATING ENGINEERING

### Small Domestic Refrigerating Machines

THE author considers the difficult problem of designing and building a small domestic refrigerating machine as having been solved, and describes some types on the European market. The first of these is the "Frigorigène." In this the compressor is enclosed in an airtight jacket consisting of two copper spheres, the first of which forms the condenser and also contains the compressor, while the second constitutes the evaporator. The compressor is freely mounted on a hollow shaft passing through the spheres and is held in a vertical position by its own weight. The shaft and spheres are rotated by a motor while the compressor remains vertical and stationary, a handle actuating the pistons of the compressor, which is of the two-cylinder type.

Sulphurous acid is used as the working liquid. It is evaporated in the second sphere forming the evaporator and delivered by suction through the hollow shaft into the cylinders of the compressor. It is there strongly compressed and then permitted to escape into the jacket of the first sphere, which constitutes the condenser. There it is liquefied by contact with the metal wall which is cooled by being washed by cold water. The liquefied gas then goes to the evaporator and is there evaporated, taking up heat from the brine.

The compressor consists of two short cylinders, and as it works in the same atmosphere as that which it handles, minor leaks are immaterial. The quantity of gas admitted to the cylinder is regulated not by valves but by the oscillating movement of the cylinders. An ingenious arrangement is used for lubrication. The working fluid in liquid form as well as the lubricating oil are introduced in a predetermined quantity at the time the apparatus is erected at the shop. Both are carried away by the gyratory motion of the sphere and separated according to their densities

by centrifugal force. The oil is then carried to the compressor by a proper device. Sulphurous acid was selected as the working fluid because of the fact that it develops only innocuous pressures in the event that by negligence or accidentally the supply of cooling water should happen to be cut off.

In the "Autofrigor" refrigerator a vertical shaft is used. The working fluid is methyl chloride, and in this apparatus as in the preceding one, all the working fluid and lubricant necessary for several years of operation is put in at the time of the erection of the device.

Comparatively little is known of the third apparatus, the "Frigorator," except that the compressor is of the rotary valveless type and the condenser is of the countercurrent type.

The "Polaire" refrigerator works on a principle different from all the others, because refrigeration is produced by a gas liberated from a solution by heat and reabsorbed by the solution on its losing temperature. The advantage claimed for this system is that it does not employ any compressor, motors, or moving apparatus. The operation of the device is as follows:

*First Stage* (lasting approximately  $1\frac{1}{2}$  hr.). A supersaturated solution of ammonia contained in a heating cylinder is brought to boiling by electric or gas heating. The ammonia gas which is formed passes into the separator where it is freed from entrained water vapor. The anhydrous gas then goes to a condenser formed by coils cooled by water circulation. The gas is there liquefied and eventually collects in the lower part of the evaporator.

*Second Stage* (lasting approximately twice as long as the first one). The testing of the liquid being completed (which takes place when the temperature in the heater has reached approximately 115 deg. cent. = 419 deg. fahr.), the heat is automatically cut off and the cooling of such solution as remains in the heater is accelerated by a circulation of cold water. Under these conditions the liquid ammonia passes back to the gaseous state and returns to the heater where it is absorbed by the water. The change of state which it undergoes in the rest of tubes of the evaporator causes a pronounced drop in temperature, which is used for refrigeration. As soon as this takes place the first part of the cycle recommences automatically. (Chas. Schlumberger in *Bulletin de la Société Industrielle de Mulhouse*, vol. 90, no. 6, June-Aug., 1924, pp. 405-412, 3 figs., d)

## SHIPBUILDING

### A 20,000-Ton Diesel Electric Liner

DESCRIPTION of a suggested propelling-machinery arrangement for a 20,000-ton liner as suitable for the transatlantic trade.

The fuel bill is a large item of running expenses of ships which makes it of importance in considering ship design. Of the factors materially affecting the cost of fuel the following two are particularly mentioned: The price per unit of heat energy available, and the overall efficiency from the heat energy in the fuel to the work done at the propellers. As regards the former, it is pointed out that coal having 14,000 B.t.u. per lb. at 25 s. a ton gives the same price per unit of energy available as oil with 18,500 B.t.u. per lb. at a cost up to 33 s. per ton.

For a 20,000-ton liner may be used either a steam-turbine plant with mechanical speed-reduction gears to the propellers or Diesel engines. There is now being built for the Union Castle Line at Belfast a 20,000-ton liner to be engined with direct-drive Diesels. The author of the paper favors the use of a number of small high-speed Diesels in combination with electric drive, that is, on the multiple-unit system, for the following reasons: Greater reliability, as part of a multiple-unit plant may be shut down without stopping the ship; the size of the parts in the smaller engines makes repairs easier; the engines are simpler by not having to be reversible, maneuvering being operated by the electrical apparatus; power per cylinder does not have to be too large; small high-speed engines can be totally enclosed and therefore designed for a very efficient lubrication system.

The author believes that at the present stage of development it does not seem practicable to engine a liner of 12,500 shaft hp. with Diesels except by the use of electric drive.

The author compares in particular the relative merits of the two systems that would appear most competitive, that is, steam tur-

bines with mechanical gears and the Diesel-electric, the proposed Diesel-electric equipment to have eight Diesel engines, four alternating-current generators, and four induction motors. The propellers are to be designed for 16 knots at 120 r.p.m. as compared with 80 r.p.m. for turbine ships. The higher mean speed of propellers involves a probable loss in propulsive efficiency of about 2 per cent. The computation of Diesel-engine efficiencies is based on the results obtained with the motorship *Havelland*, a cargo boat built by Blohm and Voss of Hamburg for the Hamburg-American Line. One of the unusual features of the design described here is that instead of the usual direct current, alternating current is recommended because of its lower initial cost, greater robustness, and necessity for less attention in service. The main generators would have to be specially designed, however, for the duty required and the author gives the specifications. Two induction motors are to be used on each shaft.

The estimated performances of boilers and gear turbines on the one hand, and the Diesel-electric plant on the other, are given. It is considered that in a round trip of 28 days, of which 18 days are spent at sea and 10 days in port, there would be a saving of 27 per cent on the fuel cost, but the cost of the propelling machinery would be, for practically the same weight of the plant, £100,000 for steam and £150,000 for the Diesel-electric plant, the insurance and depreciation charges being also higher with the Diesel. Because of the saving in fuel oil, the total profits would be higher for the motorship than for the Diesel. (Percival J. Higgs in *Transactions of the Institute of Marine Engineers*, vol. 36, Aug., 1924, original paper pp. 197-222, 11 figs. and discussion pp. 222-234, d)

## SPECIAL PROCESSES

### New Lock-Joint Brass Tubes

DESCRIPTION of a method for making these tubes developed by William Jaquiere. The machine used in this method forms the tube from a sheet of brass, locks it, and draws it down to smaller sizes in one operation.

A strip of brass is fed into the machine from an ordinary reel of sheet brass. Small wheels bend the strip into a "U," in the same direction, close against the sides of the "U." That is, the edge of the right-hand side of the "U" is bent back almost parallel with the edge. The edge of the left side of the "U" is bent also to the right, being bent back inside the "U" nearly parallel with the sides. As the strip proceeds through the machine the right-hand bent edge is caught under the left-hand bent edge and the two are locked together by the pressure exerted as the new-formed tube is passed through a die. The tube then passes through another die which reduces it and it comes out on an ordinary draw bench where it is caught by the automatic pulley of the bench and redrawn.

The draw benches are automatically operated, two of the tube-forming machines being operated in conjunction with one bench so that one can draw tubes at the rate of 25 ft. per min. (*The Metal Industry*, vol. 22, no. 9, Sept., 1924, p. 372, 1 fig., d)

## TESTING AND MEASUREMENTS

### Work of Fatigue Panel of Aeronautical Research Committee

SHORTLY after the war the Aeronautical Research Committee appointed a Board to investigate the problem of the fatigue of metals. The main problems with which the Board is dealing may be stated in a series of questions: Why does it require a large number of alternations of strain to cause a fatigue fracture? Does this failure originate within a crystal or between the crystals: if within a crystal, does it begin in the middle or at a boundary? Does the failure occur in tension, or by shearing? How is the plane of the initial failure related to the axes of the principal stresses and to the crystal lattice (if it occurs within a crystal)? How is fatigue failure connected with hysteresis in elasticity?

One of the first questions dealt with was standardization of nomenclature. Fatigue limits are quoted by the Board in terms of strain rather than stress in many cases, for reasons explained in the original article.

One of the practical difficulties in studying fatigue is that it takes such a long time to determine a fatigue limit, and a search

was made for quicker methods of finding it. A successful method was found by Mr. Gough at the National Physical Laboratory. It consists in finding the limit of proportionality for a rotating test piece (Woehler), i.e., the stress at which the deflection of the rotating test piece ceases to be proportional to the load. A mirror is fixed on the end of the Woehler test piece and accurately adjusted so that its plane is normal to the axis of rotation. A telescope and scale fixed in front of the mirror, and at a considerable distance from it, enable the deflections to be accurately observed. Gough found that the limit of proportionality determined in this way corresponded very closely with the fatigue limit determined by long runs in the ordinary way. The whole test can be completed in an hour, on a single test piece. Subsequent investigations, however, have shown that this test does not always give true results.

Another method of quickly finding the fatigue limit was then investigated. Hopkinson had pointed out that there should be a rapid rise of temperature of the test piece when the fatigue limit was passed owing to hysteresis, so Mr. Gough, Professor Haigh, and Dr. Griffith made experiments on these lines. The results were quite unexpected. It was found by Haigh, when nickel was tested in this way, that there were a series of "heat bursts," or sudden evolutions of heat which rapidly died away again, as the load was steadily increased. The same phenomenon was afterward observed with other metals, e.g., in hard steels, though not so strongly marked. Griffith found that in Armco iron heat was generated at quite low stresses, and that there was no marked increase when the fatigue limit was passed. Gough also found that the heat generated gave no clear indication of the fatigue limit. These results confirmed earlier tests by Rowlett, who had shown that there was elastic hysteresis at quite low stresses. Griffith's method of testing is particularly good, as it enables him to photograph the load-strain hysteresis loops while running the test and simultaneously to measure the heat generated.

A third investigation, on somewhat similar lines, has been made by Professor Mason, though with a rather different object. Mason measured the amount of work being put into the Woehler test piece by an extension of Gough's method of measuring the deflection. If work is being put into the test piece, its deflection will not be exactly vertical, but slightly to one side. The sideways deflection measures the arm of the couple doing work on the specimen. Mason measured this sideways deflection. His results confirm the fact that there is no sudden change in the work being done on the test piece at the fatigue limit. No general method has so far been found for quickly ascertaining the fatigue limit, though Gough's method can be used successfully in many cases and the high-speed tests referred to later require only about an hour each.

While experimenting with Gough's mirror apparatus, Professor Lea found that the limit of proportionality could be raised (some 30 per cent in his samples) by removing the load and then reapplying a slightly larger load. He showed that this change represented a real raising of the fatigue limit. Gough has extended these experiments and has succeeded, by a slightly different procedure, in raising the fatigue limit still further. It appears that the metal is hardened in some way by fatigue, if the strain is not excessive. This fact has also been demonstrated by Doctor Aitchison, who showed that the Brinell tests were higher on metal that had been fatigued. The action, at first sight, appears to be somewhat analogous to the strengthening of metal by cold work, but it must be remembered that in the fatigue tests the dimensions of the test piece are unaltered, and there is nothing analogous to the rolling down or wire drawing used in applying cold work. A possible explanation of the hardening produced by fatigue is given in a paper by Gough and Hanson.

Numerous failures in airplane-engine parts had drawn attention during the war to the importance of concentrations of stress at fillets, screw threads, oil holes, and other parts where sudden changes of shape occurred, and theory appeared to indicate that under alternating stresses fatigues ought to occur at such points when the mean stress in the neighboring metal was far below the fatigue limit. There appeared to be no reason why such failures should not occur, even though the sharp corners were very minute; in fact, scratches of microscopic dimensions might start

fatigue cracks, which, once started, must spread. An investigation of this problem was therefore made in the author's laboratory by Mr. Thomas. Scratches were made by diamond points and by very finely ground steel tools; their shapes were accurately determined by making gelatine casts of the scratches and then cutting microtome sections of the gelatine and photographing them under the microscope. As a result it was found that the weakening effect of the sharpest scratches did not exceed 30 per cent—a sufficiently serious reduction of strength, though far less than theory had suggested. By comparing the shapes of the scratches made by files and emery, an estimate was made of the effect of various styles of machine finish on the strength of the metal.

Other tests are described in the original article. For example, to determine whether fatigue strength would go up if the rate of elongation were increased. Another investigation dealt with the strength of springs. (Prof. C. F. Jenkin in a paper read before Section G of the British Association at Toronto, August 11, 1924. *Engineering*, vol. 118, no. 3059, Aug. 15, 1924, p. 245, eA)

## VARIA

### Energy Expenditure of the Yale Crew

DATA of an investigation of physiological processes of the Yale crew preparing for the 1924 Olympic championship.

A few minutes before the crew left for New London, final tests were run on three men, Wilson, Kingsbury, and Spock, now rowing Nos. 2, 6, and 7 on the Varsity crew. The efficiency reached as the result of training was strikingly shown, and the results furnish a basis for calculating the energy expended during a race. The energy is actually measured by the amount of oxygen consumed each minute; one liter of oxygen giving 4.8 cal. of heat, or 2080 kg-m., or 15,000 ft-lb., or nearly half a horsepower for a minute. About one-fourth of the energy produced goes into the oar and is applied to driving the boat; a higher efficiency than most steam or gasoline engines attain.

An ordinary man sitting quiet breathes about 6 liters of air a minute and consumes about 0.25 liter of oxygen. His maximal effort involves about eight times as much air and oxygen. The ordinary class crews reach about 3 liters of oxygen consumed per man per minute during a vigorous effort.

The Varsity men are now consuming about 0.4 liter of oxygen, even when sitting at rest. They are able to carry a consumption of oxygen well up to 3 liters of oxygen per minute for the whole period of a race, and each man breathes 60 to 70 liters (15 to 17 gal.) of air a minute. For two or three minutes at a time they can get up to an oxygen consumption of 4 liters per minute. This is as high a figure as has ever been measured on man. During the first two or three minutes of a race they also run up an oxygen deficit of 4 or 5 liters. The total energy production of each man is thus well up toward four horsepower in the first few minutes, with nearly one horsepower driving the boat through each oar. The fuel consumption of a four-mile race amounts to between a quarter- and a half-pound of sugar per man.

Men who are untrained continue to breathe abnormally for a long time after exertion. The crew men can make a maximal exertion for three or four minutes, and return practically to normal within ten minutes thereafter. They have so large an oxygen intake that they are not compelled to overdraw their account, or use their "oxygen credit" to any great extent, unless very hard pushed, and they pay it back quickly and easily afterward. A number of other interesting and valuable facts have developed from this investigation which will be published in full in a scientific journal. (Yandell Henderson, Prof. of Applied Physiology, Yale University, New Haven, Conn., in *The Yale Alumni Weekly*, vol. 34, no. 2, Sept. 26, 1924, p. 38, e)

## CLASSIFICATION OF ARTICLES

Articles appearing in the Survey are classified as *c* comparative; *d* descriptive; *e* experimental; *g* general; *h* historical; *m* mathematical; *p* practical; *s* statistical; *t* theoretical. # Test Code for Gas Producers

## Tentative Draft of a Code in the Series of Nineteen being Formulated by the A.S.M.E. Committee on Power Test Codes

*The Main Committee on Power Test Codes takes pleasure in presenting a tentative Test Code for Gas Producers for criticism and comment. The Individual Committee which developed this code consists of Dr. W. T. Magruder, Chairman, W. B. Chapman, R. H. Fernald, G. J. Rathbun, C. D. Smith and H. F. Smith.*

*In 1918 the Committee on Power Test Codes was organized by the Council of the A.S.M.E. to revise and enlarge the Power Test Codes of the Society published in 1915. The committee consists of a Main Committee of twenty-five members under the chairmanship of Fred R. Low, and nineteen Individual Committees of specialists who are drafting test codes for the various prime movers and the other auxiliary apparatus which constitutes power plant equipment.*

*The Individual Committee, the Main Committee and the Society will welcome suggestions for corrections or additions to this draft of its code from those who are specially interested in the manufacture and use of Gas Producers. These comments should be addressed to the Chairman of the Committee in care of The American Society of Mechanical Engineers, 29 West 39th Street, New York, N. Y.*

### INTRODUCTION

1 General instructions for the conduct of tests are given in the division of this code entitled "General Instructions," and that division should be studied carefully and followed in detail. In particular, before any test is begun, the object sought must be determined and agreed upon by all interested parties, and must be borne in mind throughout the test.

2 The "Code on Definitions and Values" defines certain technical terms and numerical constants which are used throughout this code with the meaning and values there established.

3 The "Code on Instruments and Apparatus" discusses fully the selection, calibration, application, and use of instruments for test observations. Those parts of that code covering instruments to be used in a gas producer test should be studied in detail and followed accurately and fully in arranging for and conducting tests. In the following paragraphs, specific references are given to paragraphs in the "Code on Instruments and Apparatus."

4 This code for conducting tests of gas producers is intended primarily for tests of producers whose gas is to be used for power purposes, but also may be used for those generating gas for metallurgical and other heating purposes. The term "fuel," as herein used, includes all possible fuels—coals, coke, charcoal, refuse, and oils. In testing a gas producer, tests of the auxiliary apparatus must be frequently included, as being essential parts of the gas-generating unit. If a complete test of the gas-producer plant is desired, separate records should be made of the amounts of fuel, water, manual and skilled labor, electric current, and of the power required to operate the producer and each of its auxiliaries, the cost of each of same, and the usual calculations should be made and the proper conclusions drawn.

### OBJECTS

5 In accordance with the "General Instructions" the objects of the test should be definitely determined and recorded before the preparations are made. If the object relates to the fulfilment of a contract-guarantee, an agreement should be made between the interested parties concerning all matters about which disputes may arise, as noted in Par. 2 of the "General Instructions," and the points agreed upon should be stated in the Report of the Test. Some of the objects for which tests of this character may be made are to determine:

- (a) The maximum and most efficient capacities of the producer plant and of each of its several elements
- (b) The efficiency of the producer as a whole in making gas, and the efficiencies of each of its several elements
- (c) The ability of the producer to use a particular kind of fuel, and in a particular way
- (d) The labor and power required to operate the producer
- (e) The quantity of cooling water required
- (f) The cleanness of the gas delivered
- (g) Comparisons of different kinds and sizes of fuels and the results obtained by using them in different ways

- (h) Comparison of the amounts of manual and skilled labor and of the electric current or power required to operate the producer and each of its auxiliaries
- (i) The causes for the faulty operation of the producer. When tests are made to determine the effect of changing one variable all the other variables should be kept constant during these tests.

### MEASUREMENTS

6 The measurements involved in the test of a gas producer and of its auxiliaries will depend to some extent upon the objects for which the test is conducted as defined in Par. 2 above. In general, these measurements will include several of the following quantities:

- (a) The general data relative to the type of producer and of each of its auxiliaries and their principal and important dimensions, as defined in Table 1, Items 7 to 35. These should be determined from the drawings and checked from the plant
- (b) The sizes and weights of each of the solid fuels, the weight of oil, and the weight of tar supplied to the producer and their physical characteristics and rates of firing
- (c) The ultimate and proximate analyses and the calorific values of the fuel and tar supplied to the producer and of the hot gas, cleaned gas, and tar delivered by the producer plant, and the specific gravity of each of the above
- (d) The weights of water and their total heats above 68 deg. Fahr. supplied to the producer and to each of its auxiliaries, and their rates of supply
- (e) The volume, pressure, temperature, and humidity of the air delivered to the producer
- (f) The temperatures of the water delivered to the producer and to each of its auxiliaries, of the steam generated, and its quality, of the gas delivered to and by each of the units of the plant wherever a change of temperature occurs
- (g) The barometric pressure and the temperature of the atmosphere, the pressures of the steam at the steam jet, in the evaporator, in the boiler and elsewhere, the suction and pressures of the gas before and after passing each auxiliary and on being measured for calorific value and quantity
- (h) The humidity of the air and steam delivered to the producer
- (i) The quantity of gas of known temperature, absolute pressure, analysis, humidity, and calorific value delivered, and the rate of generation
- (j) The amounts of gross power used in operating scrubbers, purifiers, pumps, exhausters, and each of the other auxiliaries and in cleaning, rotating and in poking the producer
- (k) The amounts of manual and skilled labor used in operating the producer and each of its auxiliaries
- (l) The scaling properties of the water
- (m) The wear and tear and length of life of the fuel-feeding devices, grates, valves, cleaning materials used, and of engines, motors, and other auxiliaries
- (n) The size of coal should be determined by screening a sample, using screens referred to in the General Instructions.

### INSTRUMENTS AND APPARATUS

7 The apparatus and instruments required for producer tests are:

- (a) Measuring rods, rules, or tapes
- (b) Platform scales and weighing vessels of ample capacity for weighing fuels, ashes, and waters
- (c) Fuel sampling and analyzing appliances and appurtenances, and hydrometers
- (d) Fuel calorimeter and its appurtenances, including extra calibrated thermometers
- (e) Steam calorimeters, including extra calibrated thermometers
- (f) Gas calorimeters, both sampling and continuous, with sampling tubes, and an ample supply of suitable water at a constant pressure and at a temperature preferably as much below the temperature of the air of the room and of the burnt gases as the outlet temperature of the water is above that temperature
- (g) Gas-analyzing apparatus and appurtenances
- (h) Tar determinator
- (i) Soot determinator
- (j) Moisture determinator
- (k) Gas meter, venturi meter, pitot meter, orifice meter, or other suitable apparatus, for measuring the gas output with accompanying thermometers, thermometer wells, and manometers or pressure gages
- (l) Manometers, draft and pressure gages
- (m) Water meters, or other water-measuring apparatus, for measuring

feed and scrubber waters and steam meters, or the equivalents, for measuring the steam used by each of the units of the plant. If water is weighed, the use of 2 1/2-in., or larger, quick-opening valves for 600 to 1000-lb. tanks is recommended

- (n) Thermometers and wells
- (o) Instruments for measuring or determining the power required to rotate the producer, to poke the producer, to operate the water pump, oil-fuel pump, tar extractor, scrubber, purifier, and each of the other motive appliances
- (p) A continuous indicating calorimeter showing the heating value of the gas being delivered furnishes a valuable adjunct for both testing and operating purposes
- (q) Such apparatus, instruments, and appliances as may be needed to calibrate and insure the correctness of each of the above.

Full directions concerning the use and calibration of the above noted appliances are given in the Code on Instruments and Apparatus.

The location of the pitot tube, or orifice, if used, should be in the delivery pipe at a point either near the producer for uncleaned fuel gas, or beyond the scrubber for power and cleaned gas, and at least ten diameters beyond the last fitting, or at both points, according to the use to be made of the gas and other requirements.

#### PREPARATIONS

8 First, Paragraphs 1 to 30 of the "General Instructions" should be read and studied carefully. Next, the dimensions of the producer and of each of its appurtenances and appliances, and the physical condition of each should be carefully determined and recorded. The testing appliances, etc. should then be installed, as directed in the General Instructions, and the preparations completed for making the test, including the provision of an adequate number of suitably prepared log blanks and other supplies which may be needed for the different pieces of apparatus, appliances, and auxiliaries. With a suction producer, tests should be made for air leaks which should be stopped. The use of photographs taken of the assembled equipments is recommended.

#### OPERATING CONDITIONS

9 The method of testing, the length of the test and the operating conditions necessary to conform to the object of the test should then be determined. Care should be taken to see that these conditions are maintained throughout the test.

The character of the fuel to be used should be determined. If an untried fuel is selected, a preliminary trial of the fuel in this apparatus should be made and the best method of using it ascertained. Whatever the fuel, it should be weighed and not measured. It should be sampled for dryness and due allowance made for the moisture so used in producing gas during the test.

10 In tests of maximum efficiency and capacity of a producer for comparison with other producers, the fuel should be of the kind which is commercially regarded as a standard for such use in the locality where the test is made. Unless previously decided otherwise, the fuel selected for test of the gas producer should be the best of the class so selected, free from unusual slag-forming impurities, and of the proper and uniform size for its specific use. In making comparative tests of different producers, care should be taken to see that each producer is operated in a normal and ordinary manner and that each receives uniform and equal care and attention.

#### DURATION OF TEST

11 *Full-Time and Complete Tests.* The duration of both efficiency and capacity full-time tests of a producer, with the exceptions noted below, should be such that the probable error in weighing the coal does not exceed 2 per cent, or that the total consumption of fuel is at least twice the weight of the fuel contained in the producer when in normal operation, estimating this weight in the case of coal at 45 lb. per cu. ft. In no case should the duration be less than 24 hours after the producer has reached the desired and constant operative temperatures and conditions, except by various agreement. Tests to determine the clinkering tendencies of a fuel and the quality of the ashes will normally require five or more days in large producers.

12 *Intermittent Producers.* In cases which require the fuel bed to be entirely removed and rebuilt at regular intervals, and in producers where a complete cleaning and renewal occurs before the total consumption above stipulated has been reached, the dura-

tion should be that of one or more of the regular commercial operating cycles, or the time elapsing between a corresponding number of successive renewals of the fuel bed. The time of starting and stopping may be taken from either immediately after cleaning, or midway between two cleanings, care being taken in the latter case to see that the fuel bed is at the same level in stopping as in starting.

13 *Spot Tests.* Where the cost of making a full-time test is prohibitive, or where for any other reason it is not desired, or where a frequent check is desired on the capacity, efficiency and character of the output of the gas producer at any time, a "spot test" may be made without elaborate preparation, with the use of equipments frequently found in such plants, and with the services of an analytical chemist, provided (a) the fuel used, such as anthracite, charcoal, coke and oil, produces negligible amounts by weight of tar or other condensible carbon vapors, and (b) the cooling water is recirculated so that it will remain saturated with the CO<sub>2</sub> and other gases being produced.

For this purpose there will be needed an appliance for continuously sampling the gas, say for one hour, or else for taking a series of spot samples; apparatus for analyzing and determining the composition of the gas produced; and either a continuous gas calorimeter or the equivalent. The average heating value of the gas may be calculated from the volumetric analysis of the gas under standard conditions by the use of appropriate values of the calorific power of the constituent gases. The average volumetric analysis for the included period is then converted into an analysis by weight, from which the total weight of carbon in one cubic foot of standard gas may be determined as follows: If the sum of the proportions by volume of CO, CO<sub>2</sub>, CH<sub>4</sub>, and other carbon compounds containing one atom of carbon be multiplied by 0.03127, and if the sum of the proportions by weight of the C<sub>2</sub>H<sub>4</sub>, C<sub>2</sub>H<sub>6</sub>, and other carbon compounds containing two atoms of carbon be multiplied by twice 0.03127, or by 0.06253, and the two products added together, the sum will be the weight of carbon in one cubic foot of the gas at 68 deg. Fahr. and 30 in. of mercury = C<sub>s</sub>. The ultimate analysis and the calorific value of the coal as actually fired to the producer, and an analysis for the carbon-content of the dried ash will be necessary.

#### STARTING AND STOPPING

14 The conditions regarding the temperature of the producer and its contents, and the quantity and quality of the latter, especially of the clinker, should be as nearly as possible the same throughout the test, and particularly so at the beginning and at the end of the trial. To secure the desired equality of conditions, the starting and stopping should occur at the conclusion of the times of regular cleanings, and they should be preceded for a period of not less than 8 hours by the same regular working conditions as are intended to characterize the test as a whole. Unless the condition of the fuel bed at the beginning and end of a test can be so accurately determined, and possible differences in level allowed for, so that the error in determining the net weight of fuel used during the test shall not exceed two per cent, the tests should be abandoned as valueless. The operations of starting and stopping should be carried on as follows:

8a *Continuous Producers with Grate and No Ash Bed.* Remove the ash and clinkers from the grate and the lower part of the furnace space, taking care that the crust or closely united layer which supports the fuel above is not unduly disturbed. Then break open the crust and allow the mass to drop into the space left vacant. Introduce a poker rod through the poker holes in the upper head and stir up the fuel within, thereby causing it to settle and fill up the remaining spaces. As a final step, quickly replenish the producer with fuel to the working depth, which should be measured, fill the hopper level full, take the time, and consider this the starting time. Then clean the ash-pit, and thereafter proceed with the regular work of the test, using weighed fuel.

When the time arrives for bringing the trial to a close, the cleaning operations described above should be repeated, ending with filling the hopper, taking the time, and considering this the stopping time; finally removing the ashes and refuse from the ash-pit weighing and sampling them as directed, and replenishing the producer with fuel to the same working depth as at the start.

8b *Continuous Producers with Supporting Ash Beds.* Remove the ashes until the top of the ash bed is lowered to the normal working point. Introduce the poker rod and break down any bridge or crust that may have formed, at the same time closing up the channels that run through the fuel bed, thereby making the bed homogeneous. Then replenish the producer

with fuel to the working depth, which should be measured, to the same working depth as at the start, fill the hopper level full, take the time, and consider this the starting time. Thereafter proceed with the regular work of the test, using weighed fuel.

When the time approaches for ending the test, the operations above described are repeated, ending with replenishing the producer and filling the hopper with weighed fuel, taking the time, and considering this the stopping time. The ashes and refuse finally removed, unless already dry, are to be dried before weighing, if they have been wet down after being removed, otherwise they should be weighed both wet and dry and the water accredited to the water used during the test, or a sample should be taken and the moisture, as determined therefrom, allowed for.

**Se Intermittent Producers.** Thoroughly clean the producer of its entire contents. Introduce a weighed supply of fuel, start the fire, and build up the fuel bed to its working condition, using weighed fuel. When this point is reached, take the time, and consider this the starting time. Thereafter proceed with the regular work of the test.

When the time approaches for ending the test, burn the fuel bed as low as practicable to prepare for cleaning, note the time, and consider this the stopping time. Then completely empty the producer, quench the fire remaining in the live coals, separate and weigh the cake and ash, and deduct the weight of the former from that of the fuel as charged. Finally, dry the ash and refuse or take a sample and allow for the moisture as determined therefrom.

Some idea of the thicknesses of the ash-bed, incandescent-fuel and green-fuel zones may be obtained by the simultaneous use of several rods made of  $\frac{3}{4}$ -in. pipes, having a stop-pin, 3 in. long, inserted two feet from the upper and handled end, and long enough to extend down into the ash pit. These rods should be inserted vertically, through observation holes, or poke holes, in the top of the producer. The top level of the green-coal zone and the height of the fuel in the producer at each place will be shown by the distance that the rod is inserted below the observation hole when resting on the fuel. When forced down through the fuel and to the stop-pin and left there for two or three minutes, and until part of its length gets red-hot, when withdrawn, the red-hot part will show the thickness and position of the incandescent, or fire-zone. The depth of the ash-zone will be the distance from the lower line of visible heat in the rod to the grate blowerhood, or bottom of the producer. The green-fuel zone will be the space above the incandescent zone. Its thickness will be the difference between the distance from the top of the observation hole to the top of the fuel and to the incandescent zone. With tarry fuel, it may be indicated by the tarry deposit on the rod. The gas zone may be noted by the sooty deposit on the upper end of the rod. The average results should be the ones reported.

The depth of the fuel-bed is measured by the distance from the lower line of visible heat in the rod to the top of the green-fuel in the producer.

The distance from the top of the producer to the surface of the fuel bed may be found by direct measurement with the poker rod, noting by sense of touch when the end of the rod reaches the fuel.

The product of the proportion of ash from the sample of coal as fired and the proportion of carbon to net ashes from the sample of ashes and refuse will be the proportion of coal in the carbon of the ashes and refuse, and will be the weight of the carbon lost in the ashes per pound of coal as fired. The carbon lost in the ashes taken from the carbon in the coal as fired will give the weight of carbon passing over in the gas per pound of coal as fired.

If  $C_1$  is the carbon in 1 lb. of coal as fired

$C_2$  is the carbon in 1 lb. of the ashes and refuse from the producer

$A_1$  is the ash in 1 lb. of the coal, by analysis, then  $\frac{C_2}{1 - C_2}$  is the

carbon in 1 lb. of the net ash, and  $A_1 \frac{C_2}{1 - C_2} = C_3$  will be the carbon from 1 lb. of coal lost in the ashes, and  $C_1 - C_3 = C_4$ , the carbon gasified per 1 lb. of coal. The cubic feet of gas made per pound of coal will be the quotient obtained by dividing the carbon gasified per pound of coal by the weight of carbon in 1 cu. ft. of the gas, or  $C_4/C_5$ .

The cubic feet of gas per pound of coal multiplied by the B.t.u. per cubic foot of the gas will give the B.t.u. of output per pound of coal. The efficiency of gas making will be

$$E = \frac{C_4 \times \text{B.t.u. per cu. ft. of gas}}{C_5 \times \text{B.t.u. per lb. of coal}}$$

The desired output in B.t.u. per hour divided by the product of the efficiency and the B.t.u. per pound of coal will give the pounds of coal which will have to be fired per hour to generate the desired output. Weighing the coal input over any desired period at steady load will therefore permit the determination of the output capacity.

**15 Spot Tests with Tar-Producing Fuels.** Spot tests may be made when bituminous coals are used, if the tar and soot per cubic foot of the outlet gas are determined. With plants operating on tar-producing and soot-producing fuels, the above methods will apply only where the cooling water is recirculated and the tar and

soot are either gasified or separated and determined per foot of gas delivered. Where the tar is wasted, it must first be collected, weighed, sampled, and its weight compared with the weight of fuel used during the same time, so as to determine the amount of tar lost per pound of coal gasified. If the tar and soot per cubic foot of gas are carefully determined, the spot test method can be used with the uncleaned and hot gases from pressure producers.

In case the water is not recirculated, there will be a considerable absorption of  $\text{CO}_2$  by the cold water used in washing the gas. The carbon so lost can be determined either by comparing the  $\text{CO}_2$  contents of the gas samples taken simultaneously before and after passing the coolers, or by metering the cooling water used and determining by analysis the amount of carbon carried away as  $\text{CO}_2$  in the water.

With the use of continuously recording gages, calorimeters, and weighing and sampling devices, it is possible with producers using anthracite coal or charcoal to make spot tests and determine the instantaneous capacity and economy. Because of the simplicity of the equipment required, the decrease in the number of observations to be made, the decrease in the time consumed, and the ability to get quick results with fair accuracy and with no greater precaution than in the conventional heat-balance method, this method of testing a gas producer is commended. It was devised by H. F. Smith, a member of this committee.

**16 Short Tests.** If less complete and less expensive tests are desired than the full time tests given in Table 1, they may be made by determining the weight of the fuel used per day (132) and (133), the ultimate analysis of the fuel (85) to (90) the proximate analysis (80) to (84), the calorific values of the fuel and gas (153) to (156), the temperature and humidity of the air (66) and (50), the temperature, humidity, and pressure of the steam used (42), the analysis of the refuse (91) to (95), the temperature of the gas leaving the producer (63), the analysis of the gas made including the amounts of tar and moisture (141) to (150), (108) and (114).

It will not be necessary in these tests to meter the steam used or the gas made. The volume of gas made is determined by knowing the amount of carbon gasified per hour and the average amount of carbon in 1 cu. ft. of gas as it leaves the producer, including the carbon in the tar and soot. The amount of water vapor coming from all sources must equal the water equivalent to the hydrogen, both free and combined, in the gas, tar, and water going into the gas-main from the producer. Knowing the amount of hydrogen coming from the fuel and the amount coming from the moisture in the air; the remainder will equal the hydrogen entering the producer as steam from the boiler, and as vapor from the ash pit, water seal, and elsewhere. From these data the gas and tar produced per ton of coal and the total heat in the gas, both sensible and potential, and the thermal efficiency can be calculated.

## RECORDS

See also Code on Fuels, and Code on Instruments and Apparatus.

**17 Ashes and Refuse.** See Code on Fuels, and Code on Instruments and Apparatus.

**18 Calorific Tests and Analyses of Fuel.** See Code on Fuels, and Code on Instruments and Apparatus.

**19 Analyses and Calorific Tests of Fuels.** The quality of the gas should be determined by calorimetric test or chemical analysis or both. Continuous samples for the purpose should be taken from the delivery pipe at a point near the producer and at other points as may be needed. The calorimetric test should be made with a Junkers type of calorimeter, described in the Code on Instruments and Apparatus, or its equivalent. For an approximate determination of the composition of the gas, the Orsat apparatus may be used, and for a complete determination, the Hempel apparatus or its equivalent. These are described in the Code on Instruments and Apparatus. The frequency with which these determinations should be made depends on the uniformity of the output, but the intervals, where practicable, should not be more than one-half hour, the time taken for collecting each sample being not less than one-quarter hour.

## CALCULATION OF RESULTS

**20 Total Volume of Gas Delivered.** The volume of gas as measured by the pitot meter is determined by multiplying the effective

area of the delivery pipe in sq. ft. at the tube by the average velocity of the gas in feet per minute over that area, and the product by the duration of the trial in minutes.

The equivalent volume at standard atmospheric pressure of 30 in. of mercury and standard temperature of 68 deg. fahr. is obtained by multiplying the measured volume by the absolute pressure of the gas in lb. per sq. in. (gage pressure plus 14.74 or the equivalent barometric pressure) and by the constant 35.82 (527.6/14.74), and dividing the product by the absolute temperature of the gas (temperature by thermometer plus 459.6 deg.).

The gas as it leaves the scrubber is saturated with water vapor at the pressure due to its temperature, and this pressure is to be deducted from the absolute pressure, as observed, to obtain the net pressure of dry gas. The volume of dry gas in that case is obtained by the following formula:

$$V = V_s \times \frac{P - P_w}{P_a} \times \frac{528}{t + 460}$$

in which  $V$  = equivalent volume of dry gas at 68 deg. and 30 in. leaving scrubber

$V_s$  = observed volume of gas leaving the scrubber

$P$  = absolute pressure at the point where the volume is measured

$P_w$  = pressure of saturated water vapor at temperature  $t$

$P_a$  = atmospheric pressure (14.74 lb. per sq. in., or 30 in. of mercury)

$t$  = observed temperature of gas leaving scrubber.

$P$  and  $P_w$  are to be taken in the same units as  $P_a$ .

The volume of dry gas delivered by a gas producer can be obtained by calculation from the analyses of the fuel and of the dry gas, by the following method:

Dry gas per lb. carbon

$$= \frac{11\text{CO}_2 + 80 + 7(\text{CO} + \text{N} + \text{C}_2\text{H}_4) + 4\text{CH}_4 + 0.5\text{H}}{3(\text{CO}_2 + \text{CO} + \text{CH}_4 + 2\text{C}_2\text{H}_4)}$$

in which  $\text{CO}_2$ ,  $\text{O}$ ,  $\text{CO}$ ,  $\text{H}$ ,  $\text{CH}_4$ ,  $\text{C}_2\text{H}_4$ , and  $\text{N}$  are percentages of the dry gas per lb. Multiplying the lb. of gas per lb. of carbon by the percentage of carbon in the fuel and dividing by 100 gives the weight of dry gas per lb. of fuel and the volume of gas per lb. of fuel is found by dividing this weight by the weight of one cubic foot of the gas calculated from the analysis as shown in Par. 22 below.

The weight of carbon per 100 cu. ft. of gas at 30 in. and 68 deg. fahr. can be found directly from the analysis by multiplying the per cent by volume of each gas containing carbon by the pounds of carbon in 1 cu. ft. of the gas as follows:

$$\begin{aligned} \text{CO} + \text{CO}_2 &\times 0.03126 \\ \text{CH}_4 &\times 0.03128 \\ \text{C}_2\text{H}_4 &\times 0.06253 \end{aligned}$$

and adding the results together. The volume of clean gas delivered per pound of fuel may be found by subtracting the sum of the weights of carbon in the tar, soot and ashes, and refuse per pound of fuel from the weight of carbon in a cu. ft. of gas, all at the same temperature and pressure.

21 *Net Volume of Dry Gas Delivered.* The net volume of dry gas delivered is found by subtracting from the total volume the volume of gas that would be required for furnishing steam or power for any purposes concerned in the operation of the producer and its auxiliaries.

22 *Gross Weight of Dry Gas.* The weight of dry gas delivered is found by multiplying the volume in cu. ft. reduced to 68 deg. and 30 in. pressure, by the weight per cu. ft. of dry gas, which is found by multiplying the percentage of each component gas as found by analysis by its weight in lb. per cu. ft. at 68 deg. and 30 in., as given in the following table (calculated from Landolt and Bornstein's figures at 32 deg. and 29.92 in.), and dividing the sum of the products by 100.

H.....	0.00533	CO <sub>2</sub> .....	0.11633
O.....	0.08460	CH <sub>4</sub> .....	0.04243
N.....	0.07408	C <sub>2</sub> H <sub>4</sub> .....	0.07411
CO.....	0.07402	SO <sub>2</sub> .....	0.16940

23 *Calorific Value of Gas.* The calorific value of the dry gas per cu. ft. is obtained by means of a Junkers type of calorimeter (See Code on Instruments and Apparatus), but it may also be obtained from the analysis by multiplying the percentage of each combustible constituent gas by its heating value per cu. ft. at 68 deg. and 30 in. as given below:

CO.....	317.8	CH <sub>4</sub> .....	1002.1
H.....	329.9	C <sub>2</sub> H <sub>4</sub> .....	1595

These figures are the product of the above values of weight of gas per cu. ft. by the heating value of one pound of gas, according to Thomsen.

24 *Moisture in Gas.* The moisture in the gas leaving the producer is found by passing a measured sample of the gas through a chloride of calcium tube and weighing the amount of moisture absorbed.

The moisture in the gas leaving the scrubber is best found by calculation assuming that the gas is saturated with moisture. The calculation is made in the manner pointed out in Par. 14a.

25 *Percentage of Tar and Soot in Gas.* The percentage of tar and soot is found by comparing the total weight determined, including that collected from the various tar drips, with the total weight of dry fuel used. (Paragraph to be extended.)

26 *Sensible Heats.* The sensible heat of the gas as delivered is the sum of the products of the constituents of the gas delivered per pound of dry fuel by their respective volumetric specific heats and the total heat of the moisture content above 68 deg. fahr. The sensible heat of the coal is the product of its specific heat per pound by the temperature difference of the coal, or surrounding air above or below 68 deg. fahr.

27 *Efficiency.* The efficiency is the ratio of the calorific value of the gross dry gas per lb. of net dry fuel charged (that is, gross dry fuel less the fuel recovered, or unburnt fuel withdrawn from the producer during or at the end of the test), or of net combustible, and the calorific value of 1 lb. of dry fuel, or of combustible, respectively. The former is ascertained by multiplying the B.t.u. per cu. ft. of gross dry gas as determined by the calorimetric test by the cu. ft. of net dry gas delivered, and dividing the product by the total net weight of dry fuel charged, or of combustible, respectively.

When the producer is supplied with steam from an outside source, rather than from its own vaporizer, for the generation of gas, the total heat used to generate the steam so supplied should be added to the heat of the fuel supplied in the same length of time to determine the efficiency.

The combustible is determined by subtracting from the weight of charged fuel the moisture in the coal and the weight of ash refuse and unburned fuel withdrawn from the producer or ash pit during or at the end of the test. The "combustible" used for determining the calorific value is the weight of the fuel less the moisture and ash found by analysis.

The "efficiency of conversion and cleaning," or "gross efficiency" in the above calculation is found by using the total gross volume of dry gas delivered. The "efficiency of the plant" or "net efficiency" is found by using the net volume of dry gas delivered. By net volume is meant the gross volume less the actual gas used, or the equivalent, to operate the auxiliaries; that is, the net volume is the amount of gas available for sale or for uses outside of the producer plant.

The "cold-gas efficiency" is the sum of the products of the constituent parts of the cold gas delivered per pound of dry fuel by their higher heating values divided by the sum of the heating value of a pound of the fuel used in the producer and the heating value of the fuel used to generate the steam supplied from an outside source per pound of the fuel used in the producer.

The "hot-gas efficiency" is obtained by adding to the potential heat of the cold coal gas as above stated the sensible heat of the gas as determined in Par. 26, and divided by the sum of the higher heating value of a pound of the fuel and the heating value of the fuel used to generate the steam supplied from an outside source per pound of the fuel used in the producer.

Unless otherwise stated, the higher heating value should always be used. If the lower, or net, heating value is used, it should always be noted, so as not to cause confusion in results.

The "cold-gas" and "hot-gas" efficiencies, both "gross" and "net," should be determined for both the higher and the lower heating values for the gas.

28 *Heat Balance.* The various quantities showing the distribution of heat in the heat balance given in Table 1 are computed in the following manner:

The heating value of the dry gas is found by multiplying the cubic feet of gas at 68 deg. and 30 in. per pound of dry fuel by the higher heating value of 1 cu. ft. of gas at 68 deg. and 30 in.

The sensible heat in the dry gas is found by multiplying the weight of gas per pound of fuel by the mean specific heat of the gas and by its temperature measured above 68 deg.

The heat carried away by the scrubber is obtained by multiplying the weight of water fed to the scrubber by the number of degrees rise of temperature, and dividing the product by the total weight of dry fuel consumed.

The heat contained in the moisture leaving the producer is found by multiplying the total weight of dry gas per pound of dry fuel by the proportion of moisture in the gas and by the total heat of 1 lb. of superheated steam at the temperature of the gas leaving the producer reckoned from 68 deg. and at net pressure.

The loss due to combustible matter in the ashes and refuse is found by multiplying the proportion that this combustible bears to the whole amount of dry fuel by 14,600 B.t.u. The heating value of the combustible matter in the ashes and refuse should be determined by a calorimeter, as a check.

In the case of those producers which are supplied with steam from a separately fired-boiler, rather than solely from the vaporizer of the producer from the sensible heats of the gases generated, either the fuel used in operating the boiler per pound of the fuel used in the producer, or the total heat of the steam as delivered to producer, divided by a known, or assumed, efficiency of the boiler, should be included in the potential heats delivered to the producer, and should be used in calculating the efficiencies.

In those producers where tar, soot, and ammonia are recovered, along with the gas, the amounts of same should be included and reported in the output, and their net values deducted from the financial report of the cost of making gas.

#### DATA AND RESULTS

29 The data and results should be reported in accordance with the form given in Table No. 2, adding lines for data not provided for or omitting those not required, as may conform to the objects in view. Unless otherwise indicated, the items should be the averages of the observed data and results.

In trials having for an object the determination and exposition of the complete performance from beginning to end, the entire logs of readings and data should be plotted on charts and represented graphically.

TABLE I DATA AND RESULTS OF GAS-PRODUCER TEST  
A.S.M.E. Code of 1923

GENERAL INFORMATION	
(1)	Date of Test.....
(2)	Location.....
(3)	Owner's name and address.....
(4)	Builder's name and address.....
(5)	Test conducted by.....
(6)	Object of Tests.....
DESCRIPTION, DIMENSIONS, ETC., OF GAS PRODUCER	
(7)	Type of producer.....
(8)	Rated size, power, or capacity of producer.....
(9)	Duration of test.....
(10)	Trade name, kind, and size of solid fuel.....
(11)	Trade name and kind of oil fuel.....
	(a) Oil fuel, specific gravity at 68 deg. fahr..... deg. Baumé
	(b) Oil fuel, specific gravity..... referred to water
	(c) Oil fuel, weight per gal. at 68 deg. fahr..... lb.
(12)	Outside diameter and height of producer..... ft.
(13)	Inside diameter at hearth..... ft.
(14)	Maximum inside diameter of lining of producer..... ft.
(15)	Minimum inside diameter of lining of producer..... ft.
(16)	Actual net diameter of the gasification zone..... ft.
(17)	Height from lowest level of grate to crown..... ft.
(18)	Height from lowest level of grate to center of gas outlet..... ft.
(19)	Vertical distance between highest and lowest levels of inclined grate..... ft.

(20)	Gross diameter of grate.....	ft.
(21)	Corresponding projected area of grate.....	sq. ft.
(22)	Gross diameter of central air-inlet through grate.....	ft.
(23)	Corresponding area of same.....	sq. ft.
(24)	Gross area of grate, if inclined.....	sq. ft.
(25)	Area of air spaces in grate.....	sq. ft.
(26)	Ratio of air spaces in grate to net, or gross, grate area.....	sq. ft.
(27)	Diameter of steam-blast inlet.....	in.
(28)	Corresponding area of same.....	sq. in.
(29)	Type of blower used.....	
(30)	Diameter of steam pipe to blast inlet, or blower.....	in.
(31)	Diameter of gas outlet.....	in.
(32)	Corresponding area of same.....	sq. in.
(33)	Area of fuel bed at maximum diameter.....	sq. ft.
(34)	Actual net area of fuel-bed at gasification zone.....	sq. ft.
(35)	Area of water heating surface in vaporizer.....	sq. ft.
(36)	Method of poking producer.....	
(37)	Method of rotating producer.....	
(38)	Method of generating steam for producer.....	
(39)	Method of cooling gas.....	
(40)	Method of scrubbing and purifying gas.....	
(41)	Method of supplying water for cooling and cleaning.....	

#### TEST DATA AND RESULTS

##### Pressures

(42)	Steam pressure boiler, or vaporizer, or as delivered to producer by gage.....	lb. per sq. in.
(43)	Gas pressure, or suction, in main at point where gas is measured.....	in. of water
(44)	Pressure, or suction, at top of producer.....	in. of water
(45)	Pressure, or suction, beyond scrubber.....	in. of water
(46)	Pressure, or suction, beyond purifier.....	in. of water
(47)	Draft pressure, or suction, in ash pit or in bottom of producer.....	in. of water
(48)	Barometric pressure of atmosphere.....	in. of mercury at deg. fahr.
(49)	Barometric pressure of atmosphere in inches of mercury at 32 deg. fahr.....	

##### Miscellaneous

(50)	Relative humidity of air.....	per cent
(51)	Humidity of steam as delivered to the producer.....	per cent wet
(52)	Average depth of fuel-bed.....	deg.
(53)	Average depth of ash-bed.....	deg.
(54)	Number of cleanings.....	
(55)	Average duration of each cleaning.....	deg.
(56)	Average intervals between cleanings.....	deg.
(57)	Average length of cleanings.....	deg.
(58)	Average intervals between pokings.....	deg.
(59)	Average length of pokings.....	deg.
(60)	Ashes wet or dry.....	lb.

##### Temperatures

(61)	Temperature of feedwater entering vaporizer of producer.....	deg. fahr.
(62)	Temperature of feedwater entering outside steam generator.....	deg. fahr.
(63)	Temperature of gas leaving producer.....	deg. fahr.
(64)	Temperature of tar and soot as delivered.....	deg. fahr.
(65)	Temperature of gas in main at point where gas is measured.....	deg. fahr.
(66)	Temperature of air in room.....	deg. fahr.
(67)	Temperature of air entering the producer.....	deg. fahr.
(68)	Temperature of gas entering scrubber.....	deg. fahr.
(69)	Temperature of gas leaving scrubber.....	deg. fahr.
(70)	Temperature of gas entering purifier.....	deg. fahr.
(71)	Temperature of gas leaving purifier.....	deg. fahr.
(72)	Temperature of water entering scrubber.....	deg. fahr.
(73)	Temperature of water leaving scrubber.....	deg. fahr.
(74)	Temperature of water entering purifier.....	deg. fahr.
(75)	Temperature of water leaving purifier.....	deg. fahr.
(76)	Temperature of cooling water entering producer.....	deg. fahr.
(77)	Temperature of cooling water leaving producer.....	deg. fahr.
(78)	Temperature of ashes when being removed.....	deg. fahr.
(79)	Temperature of steam delivered to producer.....	deg. fahr.

##### Proximate Analysis of Coal Supplied to Producer

(80)	Moisture.....	per cent
(81)	Volatile matter and its nature.....	per cent
(82)	Fixed carbon.....	per cent
(83)	Ash.....	per cent
(84)	Sulphur, separately determined.....	per cent

##### Ultimate Analysis of Dry Coal

	As Fired	Dry Coal
(85)	Carbon (C).....	per cent
(86)	Hydrogen (H <sub>2</sub> ).....	per cent
(87)	Oxygen (O <sub>2</sub> ).....	per cent
(88)	Nitrogen (N <sub>2</sub> ).....	per cent
(89)	Sulphur (S).....	per cent
(90)	Ash.....	per cent

100 per cent

*Analysis of Ash and Refuse*

(91)	Carbon.....	per cent
(92)	Earthy matter.....	per cent
(93)	Moisture.....	per cent
(94)	Fusing temperature of ash.....	deg.
(95)	Nature and texture of ash.....	

## TOTALS AND HOURLY QUANTITIES AND RATES

*Total Quantities*

(96)	Gross weight of fuel charged corrected for estimated differences in weights of fuel in producer at beginning and end of test.....	lb.
(97)	Percentage of moisture in fuel.....	per cent
(98)	Net weight of dry fuel.....	lb.
(99)	Volume of air entering producer.....	cu. ft.
(100)	Its humidity.....	grains per cu. ft.
(101)	Weight of dry air entering producer.....	lb.
(102)	Ashes and refuse, wet or dry.....	lb.
(103)	Percentage of dry ashes and refuse from dry coal.....	per cent
(104)	Net combustible (Item 98-Item 102).....	lb.
(105)	Unburnt carbon in one lb. of dry ash and refuse.....	lb.
(106)	Number of cu. ft. of gross gas delivered.....	cu. ft.
(107)	Specific gravity of dry gas.....	
(108)	Weight of dry gas delivered.....	lb.
(109)	Moisture in gas leaving producer, mixed with 1 lb. of dry gas.....	lb.
(110)	Moisture in gas leaving scrubber, mixed with 1 lb. of dry gas.....	lb.
(111)	Equivalent cu. ft. of dry gas at temperature of 68 deg. and pressure 30 in. of mercury.....	cu. ft.
(112)	Net cu. ft. of dry gas at 68 deg. and 30 in.....	cu. ft.
(113)	Weight of tar and soot delivered.....	lb.
(114)	Percentage of tar and soot in gas referred to dry fuel.....	per cent
(115)	Residual tar and soot in clean dry gas.....	grains per cu. ft.
(116)	Water supplied to ashpit and water seal.....	lb.
(117)	Water supplied to vaporizer or boiler.....	lb.
(118)	Water supplied as moisture in fuel.....	lb.
(119)	Water supplied as moisture in air.....	lb.
(120)	Cooling water supplied to ash pit and water seal.....	lb.
(121)	Total water supplied to fuel bed.....	lb.
(122)	Water evaporated in vaporizer.....	lb.
(123)	Steam supplied to producer.....	lb.
(124)	Cooling water supplied to producer.....	lb.
(125)	Water supplied to scrubber.....	lb.
(126)	Water supplied to purifier.....	lb.
(127)	Total water supplied to generate steam for producer.....	lb.
(128)	Water supplied to generate steam for steam pumps.....	lb.
(129)	Water supplied for other auxiliaries.....	lb.
(130)	Total weight of water supplied to producer and its auxiliaries.....	lb.
(131)	Heat supplied to producer as steam from vaporizer, or from separately fired boiler.....	
(132)	Dry fuel gasified.....	lb.
(133)	Dry fuel per sq. ft. of main fuel bed.....	lb.
(134)	Power required for auxiliaries, mechanical or electrical.....	hp. or kw. per hr.
	Supplying air, as by turbo-blower, lb. of steam, or kw. per hr.	
	Water pumps.....	
	Tar pumps.....	
	Scrubbers.....	
	Purifiers.....	
	Poking fire.....	
	Rotating producer.....	
	Exhauster.....	
	For charging producer.....	
	Total power, mechanical or electrical.....	
(135)	Fuel supplied to auxiliary boiler for supplying steam to the producer.....	lb.
(136)	Fuel supplied to the pumps which supply water to the producer, scrubber and purifier.....	lb.
(137)	Fuel supplied to the producer for gas-making.....	lb.
(138)	Total fuel supplied to the plant and its auxiliaries.....	lb.
(139)	Manual labor	
	Labor supplied for generating steam.....	men-hours
	Labor supplied for charging producers.....	men-hours
	Labor supplied for poking fire.....	men-hours
	Labor supplied for rotating producer.....	men-hours
	Labor supplied for cleaning producer.....	men-hours
	Labor supplied for operating auxiliaries.....	men-hours
	Labor supplied for other operations.....	men-hours
	Total labor supplied for operating plant.....	men-hours
(140)	Rate of pay of manual labor	
	Rate of pay of labor supplied for generating steam.....	cts.
	Rate of pay of labor supplied for charging producers.....	cts.
	Rate of pay of labor supplied for poking fire.....	cts.
	Rate of pay of labor supplied for rotating producer.....	cts.
	Rate of pay of labor supplied for cleaning producer.....	cts.
	Rate of pay of labor supplied for operating auxiliaries.....	cts.
	Rate of pay of labor supplied for other operations.....	cts.
(141)	Costs of manual labor	
	Cost of labor supplied for generating steam.....	dollars
	Cost of labor supplied for charging producer.....	dollars
	Cost of labor supplied for poking fire.....	dollars
	Cost of labor supplied for rotating producer.....	dollars

Cost of labor supplied for cleaning producer.....	dollars
Cost of labor supplied for operating auxiliaries.....	dollars
Cost of labor supplied for other operations.....	dollars
Total cost of labor supplied for operating the plant.....	dollars

*Analysis of Dry Gas by Volume*

(142)	Carbon dioxide (CO <sub>2</sub> ).....	per cent
(143)	Carbon monoxide (CO).....	per cent
(144)	Oxygen (O <sub>2</sub> ).....	per cent
(145)	Hydrogen (H <sub>2</sub> ).....	per cent
(146)	Methane, or marsh gas (CH <sub>4</sub> ).....	per cent
(147)	Ethylene, or olefiant gas (C <sub>2</sub> H <sub>4</sub> ).....	per cent
(148)	Hydrogen sulphide (H <sub>2</sub> S).....	per cent
(149)	Sulphur dioxide (SO <sub>2</sub> ).....	per cent
(150)	Ammonia (NH <sub>3</sub> ).....	per cent
(151)	Nitrogen (N <sub>2</sub> ) by difference.....	per cent
(152)	Total combustible in dry gas.....	per cent

*Calorific Values by Calorimeter*

(153)	Higher heating value of 1 lb. of fuel as fired.....	B.t.u.
(154)	Higher calorific value of 1 lb. of dry fuel.....	B.t.u.
(155)	Higher calorific value of 1 lb. of combustible by analysis.....	B.t.u.
(156)	Higher calorific value of 1 cu. ft. of dry gas at 68 deg. and 30 in.....	B.t.u.
(157)	Lower calorific value of 1 cu. ft. of dry gas at 68 deg. and 30 in.....	B.t.u.
(158)	Equivalent cu. ft. of gross dry gas at 68 deg. and 30 in. per lb. of dry fuel.....	cu. ft.
(159)	Equivalent cu. ft. of gross dry gas at 68 deg. and 30 in. per lb. of combustible.....	cu. ft.
(160)	Equivalent net cu. ft. of net dry gas at 68 deg. and 30 in. per lb. of combustible.....	cu. ft.

*Efficiencies*

(161)	Gross efficiency of producer, based on coal as fired and steam.....	per cent
(162)	Net efficiency of producer, based on coal as fired and steam.....	per cent
(163)	Gross efficiency of producer, based on dry fuel, or on fuel and steam.....	per cent
(164)	Net efficiency of producer based on dry fuel or fuel and steam.....	per cent
(165)	Gross efficiency of producer, based on combustible, or on combustible and steam.....	per cent
(166)	Net efficiency of producer, based on combustible, or on combustible and steam.....	per cent

*Costs of Fuel and Labor*

(167)	Cost of fuel per ton of ..... lb., or per gallon, delivered at plant.....	dollars
(168)	Cost of fuel per ton of ..... lb., or per gallon, delivered at charging platform.....	dollars
(169)	Cost of fuel required for producing 1000 net cu. ft. of dry gas at 68 deg. and 30 in.....	dollars
(170)	Cost of fuel for producing 1,000,000 B.t.u.....	dollars
(171)	Cost of labor per ton of ..... lb., or per gallon, delivered at plant.....	dollars
(172)	Cost of labor per ton of ..... lb., or per gallon, delivered at charging platform.....	dollars
(173)	Total cost of fuel and labor per ton of ..... lb., or per gallon of fuel gasified.....	dollars
(174)	Cost of labor for producing 1000 net cu. ft. of dry gas at 68 deg. and 30 in.....	dollars
(175)	Cost of labor for producing 1,000,000 B.t.u. of potential heat in net gas.....	dollars

*Heat Balance Based on 1 lb. of Dry Fuel and the Products Therefrom*

(176)	Higher calorific value of 1 lb. of dry fuel (Item 85).....	B.t.u. = 100 per cent
(177)	Higher calorific value of dry gas (Item 87 × Item 89).....	B.t.u. = ... per cent
(178)	Sensible heat in hot dry gas above 68 deg. fahr.....	B.t.u. = ... per cent
(179)	Total heat of moisture in gas above 68 deg. fahr.....	B.t.u. = ... per cent
(180)	Heat removed by water of scrubber.....	B.t.u. = ... per cent
(181)	Heat removed by purifier.....	B.t.u. = ... per cent
(182)	Heat lost in residual tar and soot of dry gas.....	B.t.u. = ... per cent
(183)	Heat lost as unburnt fuel in ash.....	B.t.u. = ... per cent
(184)	Heat lost by radiation and otherwise unaccounted for (Item 144 minus sum of Items 145 to 152, both inclusive).....	B.t.u. = ... per cent
(185)	Sensible heat of fuel above or below 68 deg. fahr.....	B.t.u. = ... per cent
(186)	Sensible heat of air above or below 68 deg. fahr.....	B.t.u. = ... per cent
(187)	Total heat above 68 deg. fahr. in water and steam supplied.....	B.t.u. = ... per cent
(188)	Sensible heat of ashes and refuse.....	B.t.u. = ... per cent
(189)	Heat lost to cooling water in producer.....	B.t.u. = ... per cent

When steam is supplied to producer from an outside source, the data and results should be modified accordingly.

# Report on Code for Unfired Pressure Vessels

Final Report; to be Printed and Issued as "Rules for the Construction of Unfired Pressure Vessels"  
Unless Criticisms are Received Which, in the Opinion of the Boiler Code Committee  
and the Council of the A.S.M.E., Will Warrant Changes

## A.S.M.E. Boiler Construction Code Section VIII

TO THE BOILER CODE COMMITTEE OF THE AMERICAN SOCIETY OF  
MECHANICAL ENGINEERS:

GENTLEMEN:

The object of the code covering the construction of Unfired Pressure Vessels is to provide a safe construction for the great variety of pressure containers now manufactured and used for innumerable purposes throughout the country and under an exceedingly wide range of conditions. The efforts to give publicity which have been made in order to obtain as wide a range of opinion as possible, have brought out views which were often times diametrically opposed. In such cases the attempt has been made to frame the rules in accordance with the greater weight of opinion.

It is believed that these rules will not work undue hardship on the manufacturing industries generally, and at the same time will result in the construction of reasonably safe pressure vessels, for it is undoubtedly true that many of the failures which take place are due to the lack of proper restrictions governing both material, workmanship, dimensions and supervision.

Rules for electric induction compression welding are in process of preparation and will be submitted later on for addenda to the Code.

Respectfully submitted:

E. R. FISH, Chairman      S. F. JETER  
WM. H. BOEHM          WM. F. KIESEL, JR.  
C. E. BRONSON          JAMES NEIL  
E. C. FISHER            H. V. WILLE.

## Report on Rules for the Construction of Unfired Pressure Vessels

These rules do not apply (a) to boilers and other pressure vessels which are subject to Federal inspection and control, (b) to locomotives of all types, (c) to vessels for containing only water under pressure for domestic supply, (d) to vessels subject to temperatures exceeding 750 deg. Fahr.

U-1. The Rules in this Section apply to Unfired Pressure Vessels over 6 in. in diameter, more than 1.5 cu. ft. in volume and carrying a pressure of over 30 lb. per sq. in., constructed of steel or iron plates.

### SAFETY APPLIANCES

U-2. All pressure vessels shall be protected by such safety and relief valves and indicating and controlling devices as will insure their safe operation. These devices shall be so constructed, located, and installed that they cannot readily be rendered inoperative. The relieving capacity of safety valves shall be such as to prevent a rise of pressure in the vessel of more than 10 per cent above the maximum allowable working pressure, and their discharges shall be carried to a safe place.

U-3. Safety valves shall be of the direct spring-loaded type, with seat and bearing surface of the disk inclined at an angle of about 45 deg., or about 90 deg. to the center line of the spindle; designed with a substantial lifting device so that the disk can be lifted from its seat with the spindle not less than one-eighth the diameter of the valve when the pressure on the vessel is 75 per cent of that at which the safety valve is set to blow.

U-4. Safety valves having either the seat or disk of cast iron shall not be used.

U-5. If more than one safety valve is used, the discharge capacity shall be taken as the combined capacity of all the valves.

U-6. Each safety valve shall have full-sized direct connection to the vessel. When an escape pipe is used, it shall be full-sized and fitted with an open drain, to prevent water from lodging

in the upper part of the safety valve or escape pipe. When two or more safety valves are placed on one connection, this connection shall have a cross-sectional area equal to or greater than the combined area of these safety valves. No valve of any description shall be placed between the safety valve and the vessel, nor on the escape pipe between the safety valve and the atmosphere. When an elbow is placed on an escape pipe, it shall be located close to the safety-valve outlet, or the escape pipe shall be securely anchored and supported.

U-7. Every safety valve which is exposed to a temperature of 32 deg. Fahr., or less, shall have a drain at least  $\frac{3}{8}$  in. in diameter at the lowest point where water can collect, to prevent freezing.

U-8. Safety-valve springs shall not be adjusted to carry more than 10 per cent greater pressure than that for which the springs were made.

U-9. Each safety valve shall be tested once every day, or oftener, by raising the disk from its seat.

U-10. Safety valves for compressed-air tanks shall not exceed 3 in. in diameter and shall be proportioned for the maximum number of cubic feet of free air that can be supplied per minute as shown in Table U-1.

U-11. Corrosive Chemicals. All pressure vessels which are to contain substances having a corrosive action upon the metal of which the vessel is constructed, shall be designed for the pressure they are to carry, and the thickness of all parts subject to corrosion should be increased by a uniform amount to safeguard against early rejection.

### MATERIAL

U-12. Plates for any part of a riveted vessel required to resist stress produced by internal pressure, shall be of flange- or firebox-quality steel conforming with the Specifications for Boiler Plate Steel given in the Rules for Power Boilers, except as provided in Par. U-13.

U-13. Steel plates for any part of a pressure vessel which is to be constructed with other than riveted joints, or with any combination of riveted and other joints herein considered, shall be of the quality specified for the particular kind of joint used.

U-14. In determining the maximum allowable working pressure, the maximum allowable working stress as herein provided shall be used in the computations.

U-15. For resistance to crushing of steel plate, the maximum allowable stress shall be 19,000 lb. per sq. in. of cross-sectional area.

U-16. In computing the maximum allowable stress on rivets in shear, the following values in pounds per square inch of the cross-sectional area of the rivet shank shall be used:

Iron rivets in single shear.....	7,600
Iron rivets in double shear.....	15,200
Steel rivets in single shear.....	8,800
Steel rivets in double shear.....	17,600

TABLE U-1 MAXIMUM FREE AIR SUPPLIED IN CUBIC FEET PER MINUTE FOR DIFFERENT SIZES OF SAFETY VALVES AT STATED PRESSURES

Diameter of Valve (In.)	Gage Pressure (Pounds)													
	50	100	150	200	250	300	350	400	500	600	800	1000	1200	1600
$\frac{1}{4}$	..	..	..	..	..	..	..	53	61	70	84	97	109	128
$\frac{1}{2}$	20	32	42	51	59	67	74	111	120	147	177	205	230	270
$\frac{3}{4}$	37	59	78	96	112	127	141	176	224	232	242	346	386	423
1	58	94	124	152	178	202	224	248	286	324	390	450	500	586
$1\frac{1}{4}$	84	135	180	221	257	293	325	..	374	..	509	..	..	..
$1\frac{1}{2}$	114	186	248	302	354	400	444	..	472	..	634	..	..	..
2	189	306	410	501	592	668	741	..	..	..	..	..	..	..
$2\frac{1}{2}$	282	457	613	750	880	998	1114	..	..	..	..	..	..	..
3	393	638	856	1050	1230	1398	1557	..	..	..	..	..	..	..

The foregoing table is based on the following formulas:  
 $Q = 28 PDI$  for 45-deg. bevel-seat valves

and  
 $Q = 40 PDI$  for flat-seat valves

where  
 $Q$  = discharge in cubic feet of free air per minute.

$P$  = absolute pressure at which the safety valve opens (gage pressure plus 14.7 lb. at sea level).

$D$  = diameter, in inches, of the inside edge of the bearing surface between the disk and seat.

$I$  = vertical lift of the safety-valve disk from its seat, in inches, representing the lift for minimum discharge capacity, for satisfactory operation of the valve.

The cross-sectional area used in the computations shall be that of the rivet shank after driving.

#### CONSTRUCTION AND MAXIMUM ALLOWABLE WORKING PRESSURES

U-17. For all pressure vessels the minimum thicknesses of shell plates, heads and dome plates after flanging shall be as follows:

When the Diameter of Shell is		
14 in. and under $\frac{1}{8}$ in.	Over 14 in. to 24 in., $\frac{3}{16}$ in.	Over 24 in. to 36 in., $\frac{1}{4}$ in.
Over 36 in. to 54 in., $\frac{5}{16}$ in.	Over 54 in. to 72 in., $\frac{3}{8}$ in.	Over 72 in., $\frac{1}{2}$ in.

except that for riveted construction the minimum thickness shall be  $\frac{3}{16}$  in.

U-18. The minimum thicknesses of butt straps for double-strap riveted joints shall be as given in Table U-2. Intermediate values shall be determined by interpolation. For plate thicknesses exceeding  $1\frac{1}{4}$  in. the thickness of the butt straps shall be not less than two-thirds of the thickness of the plate.

TABLE U-2 MINIMUM THICKNESSES OF BUTT STRAPS

Thickness of shell plates, in.	Minimum thickness of butt straps, in.	Thickness of shell plates, in.	Minimum thickness of butt straps, in.
$\frac{3}{16}$	$\frac{3}{16}$	$1\frac{1}{2}$	$\frac{7}{16}$
$\frac{1}{4}$	$\frac{1}{4}$	$1\frac{3}{4}$	$\frac{1}{2}$
$\frac{5}{16}$	$\frac{1}{4}$	$1\frac{7}{8}$	$\frac{1}{2}$
$\frac{3}{8}$	$\frac{1}{4}$	$2$	$\frac{1}{2}$
$\frac{7}{16}$	$\frac{5}{16}$	$2\frac{1}{8}$	$\frac{5}{8}$
$\frac{1}{2}$	$\frac{3}{8}$	$2\frac{1}{4}$	$\frac{3}{4}$
$\frac{9}{16}$	$\frac{3}{8}$	$2\frac{3}{4}$	$\frac{3}{4}$

U-19. The maximum allowable working pressure is that at which a pressure vessel may be operated.

Where the term "maximum allowable working pressure" is used it refers to gage pressure, or the pressure above the atmosphere, in pounds per square inch.

U-20. For Internal Pressure. The maximum allowable working pressure on the shell of a pressure vessel shall be determined by the strength of the weakest course, computed from the thickness of the plate, the efficiency of the longitudinal joint, the inside diameter of the course, and the maximum allowable unit working stress.

$$\frac{S \times t \times E}{R} = \text{maximum allowable working pressure, lb. per sq. in.}$$

where  $S$  = maximum allowable unit working stress in lb. per sq. in.

= 11,000 lb. per sq. in. for steel plate stamped 55,000 lb. per sq. in. and 10,000 lb. per sq. in. for steel plate stamped less than 55,000 lb. per sq. in. and 9000 lb. for material used in seamless shells

$t$  = minimum thickness of shell plates in weakest course, in.

$E$  = efficiency of riveted longitudinal joint, per cent

$R$  = inside radius of the weakest course of the shell, in., provided the thickness of the shell does not exceed 10 per cent of the radius. If the thickness is over 10 per cent of the radius, the outside radius shall be used.

NOTE: When the safe working pressure for welded or brazed vessels is to be determined,  $E$  will be omitted from the formula and the values for  $S$  in Pars. U-68, U-82, or U-94 will be substituted for the values given above. For seamless shells,  $E$  equals 100 per cent.

#### JOINTS

U-21. The joints of pressure vessels, if of riveted construction, shall conform to the requirements of Pars. U-26 to U-35.

U-22. Pressure vessels may be fabricated by means of fusion or forge welding, or brazing, provided the rules governing the method adopted and as given in Pars. U-67 to U-96 of the Code are followed, except that base metal of flange or firebox qualities as given in the Rules for Power Boilers may be used.

U-23. Pressure vessels shall not be fabricated by means of fusion welding under the rules given in Pars. U-67 to U-79, inclusive, except:

a. Air vessels, when the diameter does not exceed 20 in., the length does not exceed 3 times the diameter, and the working pressure does not exceed 100 lb. per sq. in.

b. Other vessels, under these rules, in which the circumferential

joints only may be welded, when the inside diameter does not exceed 48 in.

U-24. Pressure vessels may be fabricated by means of forge welding when the rules given in Pars. U-80 to U-90 are followed.

U-25. Pressure vessels for use at any temperatures not exceeding 406 deg. Fahr., may be fabricated by means of the brazing process when the rules given in Pars. U-91 to U-96 are followed.

#### RIVETED JOINTS

U-26. The efficiency of a joint is the ratio which the strength of the joint bears to the strength of a solid plate. In the case of a riveted joint this is determined by calculating the breaking strength of a unit section of the joint, considering each possible mode of failure separately, and dividing the lowest result by the breaking strength of a length of a solid plate equal to that of the section considered.

U-27. The distance between the center lines of any two adjacent rows of rivets, or the "back pitch" measured at right angles to the direction of the joint, shall have the following minimum values:

(a) If  $\frac{P}{d}$  is 4 or less, the minimum values shall be  $1\frac{3}{4}d$

(b) If  $\frac{P}{d}$  is over 4, the minimum value shall be:

$$1\frac{3}{4}d + 0.1(P - 4d)$$

where  $P$  = pitch of rivets in outer row when a rivet in the inner row comes midway between two rivets in the outer row, in.

= pitch of rivets in the outer row less pitch of rivets in the inner row when two rivets in the inner row come between two rivets in the outer row, in. (It is here assumed that the joints are of the usual construction when the rivets are symmetrically spaced.)

$d$  = diameter of the rivet holes, in.

U-28. On longitudinal joints, the distance from the centers of rivet holes to the edges of the plates, except rivet holes in the ends of butt straps, shall be not less than  $1\frac{1}{2}$  and not more than  $1\frac{3}{4}$  times the diameter of the rivet holes; this distance to be measured from the center of the rivet holes to the top of the calking edge of the plate before calking. The corresponding distance for circumferential seams shall be not less than  $1\frac{1}{4}$  times the diameter of the rivet holes.

U-29. a. The strength of circumferential joints of pressure vessels the heads of which are not stayed by tubes or through braces, shall be at least 50 per cent of that required for the longitudinal joints of the same structure.

b. When 50 per cent or more of the load which would act on unstayed solid head of the same diameter as the shell, is, in consequence of the holding power of the tubes and stays, relieved by the effect of through tubes or stays, the strength of the circumferential joints in the shell shall be at least 35 per cent of that required for the longitudinal joints.

U-30. The riveted longitudinal joints of a shell or drum which exceeds 48 in. in diameter, shall be of butt-and-double-strap construction. This rule does not apply to the portion of a shell which is staybolted to the inner sheet.

U-31. The longitudinal joints of a shell or drum not more than 48 in. in diameter, may be of lap-riveted construction; but the maximum allowable working pressure of such construction shall not exceed 150 lb. per sq. in., nor 200 lb. per sq. in. for vessels less than 24 in. in diameter.

U-32. Butt straps and the ends of shell plates forming the longitudinal joints shall be rolled or formed to the proper curvature by pressure and not by blows.

U-33. The longitudinal joint of a dome 24 in. or over in inside diameter shall be of butt-and-double-strap construction or made without a seam of one piece of steel pressed into shape, and its flange shall be double-riveted to the shell. In the case of a dome less than 24 in. in diameter, for which the product of the inside diameter and the maximum allowable working pressure does not exceed 4000 in.-lb., its flange may be single-riveted to the shell and the longitudinal joint may be of the lap type provided it is computed with a factor of safety not less than 8.

When shells are cut to apply domes or manholes the net area of metal, after rivet holes are deducted, in flange and liner, if used,

must not be less than the area required by these rules for a length of shell equal to the length removed. A height of vertical flange equal to three times the thickness of the flange shall be included in the area of the flange.

**U-34. Rivet and Staybolt Holes.** All holes in braces, lugs and sheets for rivets or staybolts shall be drilled full size with plates, butt straps, and heads bolted up in position, or they may be drilled or punched not to exceed  $\frac{1}{4}$  in. less than full size for plates over  $\frac{5}{16}$  in. in thickness and  $\frac{1}{8}$  in. less than full size for plates not exceeding  $\frac{5}{16}$  in. in thickness and then drilled or reamed to full size with plates, butt straps, and heads bolted up in position. The finished holes must be true, clean and concentric.

**U-35.** Rivets shall be of sufficient length to completely fill the rivet holes and form heads at least equal in strength to the bodies of the rivets. Forms of rivet heads that will be acceptable are shown in Fig. U-1.

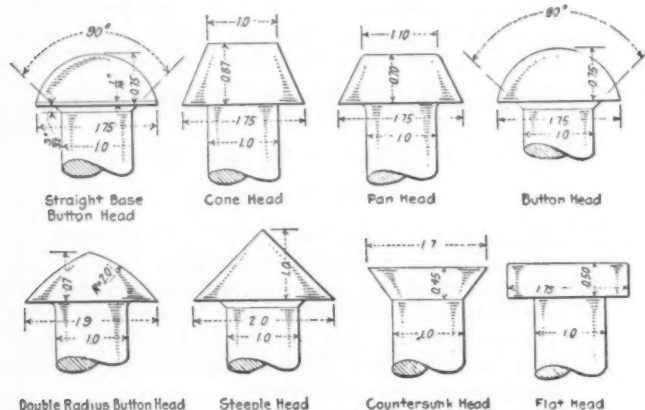

FIG. U-1 ACCEPTABLE FORMS OF FINISHED RIVET HEADS

#### DISHED HEADS

**U-36.** The thickness required in an unstayed dished head when it is a segment of a sphere shall be calculated as follows:

For  $P \times L$  equal to or less than  $\frac{1}{2} S$ ,

$$t = \frac{3PL}{4S} \text{ for pressure on concave side}$$

and

$$t = \frac{5PL}{4S} \text{ for pressure on convex side}$$

For  $P \times L$  greater than  $\frac{1}{2} S$ ,

$$t = \frac{PL}{2S} + \frac{1}{8} \text{ for pressure on concave side}$$

and

$$t = \frac{5PL}{6S} + 0.2 \text{ for pressure on convex side}$$

where  $t$  = thickness of plate, in.

$P$  = maximum allowable working pressure, lb. per sq. in.

$L$  = radius to which the head is dished, in.

$S$  = maximum allowable unit working stress of 11,000 lb. per sq. in. for steel plate stamped 55,000 lb. per sq. in., and 10,000 lb. per sq. in. for steel plate stamped less than 55,000 lb. per sq. in.

Where two radii are used, the longer shall be taken as the value of  $L$  in the formula.

Where the radius is less than 80 per cent of the diameter of the shell to which the head is attached, the thickness shall be at least that found by the formula by making  $L$  equal to 80 per cent of the diameter of the shell.

When a dished head has a manhole opening, the thickness, as determined by these Rules and formulas, shall be increased by not less than  $\frac{1}{8}$  in.

**U-37.** When dished heads are of less thickness than determined by Par. U-36, they shall be stayed as flat surfaces, no allowance being made in such staying for the holding power due to the spherical form.

**U-38.** The corner radius of an unstayed dished head measured on the concave side of the head shall not be less than three times

the plate thickness up to  $t = 1$  in., and not less than  $3t^2$  for thicker plates.

**U-39.** A manhole opening in a dished head shall be flanged to a depth measured from the outside of not less than three times the required thickness of the head.

#### BRACED AND STAYED SURFACES

**U-40.** The maximum allowable working pressure for various thicknesses of braced and stayed flat plates and those which by these Rules require staying as flat surfaces with braces or staybolts of uniform diameter symmetrically spaced, shall be calculated by the formula:

$$P = C \times \frac{T^2}{p^2} \times \frac{S}{11,000}$$

where  $P$  = maximum allowable working pressure, lb. per sq. in.

$T$  = thickness of plate in sixteenths of an inch

$S$  = maximum allowable unit working stress, lb. per sq. in.

$p$  = maximum pitch measured between straight lines passing through the centers of the staybolts in the different rows, which lines may be horizontal, vertical or inclined, inches

$C$  = 112 for stays screwed through plates not over  $\frac{7}{16}$  in. thick with ends riveted over

= 120 for stays screwed through plates over  $\frac{7}{16}$  in. thick with ends riveted over

= 135 for stays screwed through plates and fitted with single nuts outside of plate

= 150 for stays with heads not less than 1.3 times the diameter of the stays, screwed through plates or made taper fit and having the heads formed on the stays before installing them and not riveted over, said heads being made to have a true bearing on the plate

= 175 for stays fitted with inside and outside nuts and outside washers where the diameter of washers is not less than  $T$ .

If a flat plate not less than  $\frac{3}{8}$  in. thick is strengthened with a securely riveted doubling plate covering the full area of the stayed surface and having a thickness of not less than  $\frac{2}{3} T$ , then the value of  $T$  in the formula shall be three-quarters of the combined thickness of the plate and doubling plate but not more than one and one-half times the thickness of the plate, and the value of  $C$  given above may also be increased 15 per cent.

When two sheets are connected by stays and but one of these sheets requires staying, the value of  $C$  is governed by the thickness of the sheet requiring staying.

Acceptable proportions for the ends of through stays with washers are indicated in Fig. U-2.

**U-41. Staybolts.** The ends of screwed staybolts shall be riveted over or upset by an equivalent process.

**U-42. Structural Reinforcements.** When channel or angle sections or other members are securely riveted to the heads for attaching through stays, the transverse stress on such members shall not exceed  $1\frac{1}{4}$  times the maximum allowable unit working stress in pounds per square inch. In computing the stress, the section modulus of the member shall be used without addition for the strength of the plate. The spacing of the rivets over the supported surface shall be in conformity with that specified for staybolts.

If the outstanding legs of the two members are fastened together so that they act as one member in resisting the bending action produced by the load on the rivets attaching the members to the head of the pressure vessel, and provided that the spacing of these rivets attaching the members to the head is approximately uniform, the members may be computed as a single beam uniformly loaded and supported at the points where the through braces are attached.

**U-43. a.** The maximum spacing between centers of rivets attaching the crowfeet of braces to the braced surface, shall be determined as in Par. U-40, using 135 for the value of  $C$ .

**b.** The maximum spacing between the inner surface of the shell and lines parallel to the surface of the shell passing through the centers of the rivets attaching the crowfeet of braces to the head, shall be determined by the formula in Par. U-40, using 175 for the value of  $C$ .

c. The maximum distance between the inner surface of the shell and the centers of braces of other types shall be determined by the formula in Par. U-40, using a value of  $C$  equal to 1.3 times that value of  $C$  which applies to the thickness of plate and type of stay as therein specified.

d. In applying these Rules and those in Par. U-40 to a head or plate having a manhole or reinforced opening, the spacing applies only to the plate around the opening and not across the opening.

U-44. The formula in Par. U-40 was used in computing Table U-3 for steel plate stamped 55,000 lb. per sq. in. Where values for screwed stays with ends riveted over are required for conditions not given in Table U-3, they may be computed from the formula and used, provided the pitch does not exceed  $8\frac{1}{2}$  in.

TABLE U-3 MAXIMUM ALLOWABLE PITCH, IN INCHES, OF SCREWED STAYBOLTS, ENDS RIVETED OVER

Pressure, lb. per sq. in.	Thickness of Plate, In.

250	...	4	$4\frac{3}{8}$	$5\frac{1}{2}$	$6\frac{1}{4}$	$6\frac{7}{8}$	$7\frac{3}{4}$
300	...	...	$4\frac{1}{4}$	5	$5\frac{3}{8}$	$6\frac{1}{4}$	7

U-45. The distance from the edge of a staybolt hole to a straight line tangent to the edges of the rivet holes may be substituted for  $p$  for staybolts adjacent to the riveted edges bounding a stayed surface. When the edge of stayed plate is flanged,  $p$  shall be measured from the inner surface to the flange, at about the line of rivets to the edge of the staybolts or to the projected edge of the staybolts.

U-46. The minimum diameter of a screw stay (usually the root of the thread) shall be used.

U-47. The least cross-sectional area of a stay shall be taken in calculating the allowable stress, except that when the stays are welded and have a larger cross-sectional area at the weld than at some other point, in which case the strength at the weld shall be computed as well as in the solid part and the lower value used.

U-48. Holes for screw stays shall be drilled full size or punched not to exceed  $\frac{1}{4}$  in. less than full diameter of the hole for plates over  $\frac{5}{16}$  in. in thickness, and  $\frac{1}{8}$  in. less than the full diameter of the hole for plates not exceeding  $\frac{5}{16}$  in. in thickness, and then drilled or reamed to the full diameter. The holes shall be tapped fair and true, with a full thread.

U-49. The end of steel stays upset for threading, shall be thoroughly annealed.

U-50. a. The full-pitch dimensions of the stays shall be employed in determining the area to be supported by a stay, and the area occupied by the stay shall be deducted therefrom to obtain the net area. The product of the net area in square inches by the maximum allowable working pressure in pounds per square inch gives the load to be supported by the stay.

b. The maximum allowable stress per square inch at point of least net cross-sectional area of steel or iron stays and staybolts shall be as given in Table U-4. In determining the net cross-sectional area of drilled or hollow staybolts, the cross-sectional area of the hole shall be deducted.

TABLE U-4 MAXIMUM ALLOWABLE STRESSES FOR STAYBOLTS OR BRACES

Description of Stays	Stresses, Lb. per Sq. In.	
	For lengths between supports not exceeding 120 diameters	For lengths between supports exceeding 120 diameters
a. Unwelded or flexible stays less than 20 diameters long, screwed through plates with ends riveted over.	7,500	...
b. Hollow steel stays less than 20 diameters long, screwed through plates with ends riveted over.	8,000	...
c. Unwelded stays or braces and unwelded portions of welded stays or braces, except as specified in line a and line b.	9,500	8,500
d. Steel through stays or braces exceeding $1\frac{1}{2}$ in. diameter.	10,400	9,000
e. Welded portions of stays or braces.	6,000	6,000

U-51. Where it is impossible to calculate with a reasonable degree of accuracy the strength of a pressure vessel or any part

thereof, a full-sized sample shall be built by the manufacturer and tested to destruction in the presence of the Boiler Code Committee or one or more representatives of the Boiler Code Committee appointed to witness such test.

#### CALKING

U-52. *Calking.* The calking edges of plates, butt straps, and heads shall be beveled to an angle not sharper than 70 deg. to the plane of the plate, and as near thereto as practicable. Every portion of the unfinished surfaces of the calking edges of plates, butt straps, and heads shall be planed, milled, or chipped to a depth of not less than  $\frac{1}{8}$  in. Calking shall be done with a tool of such form that there is no danger of scoring or damaging the plate underneath the calking edge, or splitting the calked sheet.

#### MANHOLES AND HANDHOLES

U-53. All vessels for use with compressed air, 16 in. in diameter, or over, and not exceeding 36 in. in diameter, shall have a handhole in the shell, or head, or have a manhole.

All such vessels less than 16 in. in diameter may be constructed without a handhole, provided there are at least two pipe connections, or provided they have bolted blank flanged heads.

U-54. All vessels for use with compressed air over 36 in. in diameter, excepting those whose shape or use make it impracticable, shall have a manhole. An elliptical manhole opening shall be not less than 11 by 15 in., or 10 by 16 in., in size. A circular manhole opening shall be not less than 15 in. in diameter.

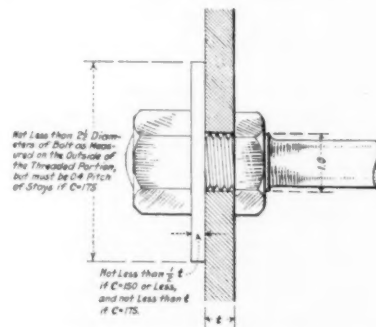

FIG. U-2 ACCEPTABLE PROPORTIONS FOR ENDS OF THROUGH STAYS

U-55. A manhole reinforcing ring, when used, shall be of rolled, forged or cast steel, shall be at least as thick as the shell plate, and shall have a net cross-sectional area, on a line parallel to the axis of the shell, not less than the cross-sectional area of shell plate removed on the same line.

U-56. Manhole frames on shells shall have the proper curvature and, when the diameter exceeds 48 in., shall be riveted to the shell with two rows of rivets.

U-57. The strength of the rivets in shear on each side of a manhole frame or reinforcing ring shall be at least equal to the tensile strength of the maximum amount of the shell plate removed by the opening and rivet holes for the reinforcement on any line parallel to the longitudinal axis of the shell, through the manhole or other opening.

U-58. Manhole plates shall be of rolled, forged, or cast steel, and their strength shall, together with that of the bolts and yokes, be in proportion to the strength of the manhole frames.

#### THREADED OPENINGS

U-59. A pipe connection 1 in. in diameter or over shall have not less than the number of threads given in Table U-5. Diameters of less than 1 in. pipe size shall have at least four threads.

If the thickness of the material in the pressure vessel is not sufficient to give such number of threads, the opening shall be reinforced by a pressed steel, cast steel, or bronze composition flange or plate, riveted or brazed on, or a boss may be built up by an autogenous welding process for an opening not to exceed 2 in. pipe size, and for a pressure not to exceed 100 lb. per sq. in., so as to provide the required number of threads.

When the maximum allowable working pressure exceeds 125 lb. per sq. in., a connection attached to the pressure vessel to receive

a flanged fitting shall be used for all pipe openings over 3 in. pipe size.

#### SUPPORTS

**U-60. Supports.** All vessels must be so supported as to properly distribute the stresses due to the weight of the vessel and contents.

Lugs or brackets when used to support a vessel shall be properly fitted to the surfaces to which they are attached. The shearing and crushing stresses on material used for attaching the lugs or brackets shall not exceed 40 per cent of the maximum allowable working stresses given in Pars. U-15 and U-16.

TABLE U-5 MINIMUM NUMBER OF PIPE THREADS FOR CONNECTIONS

Size of pipe connection in.....	1 and 1/4	1 1/2 and 2	2 1/2 to 4 inclusive	4 1/2 to 6 inclusive	7 and 8	9 and 10	12
Number of threads per inch.....	11 1/2	11 1/2	8	8	8	8	8
Minimum number of threads required in opening.....	4	5	7	8	10	12	13
Minimum thickness of material required to give above number of threads, in.....	0.0348	0.435	0.875	1	1.25	1.5	1.625

**U-61.** In laying out the plates care must be taken to leave one of the stamps required in the Specifications for material used, so located as to be plainly visible when the vessel is completed; or in case these are unavoidably cut out, the heat number, quality of plate, minimum tensile strength and maker's name shall be accurately transferred as to form by the pressure-vessel manufacturer, to a location where these stamps will be visible. The form of stamping shall be such that it can be readily distinguished from the plate maker's stamping.

**U-62.** Vessels over 12 in. in diameter must be so arranged that the interior and exterior of the vessel may be inspected. In the case of vertical cylindrical vessels subject to corrosion, the bottom head, if dished, must be with the pressure on the concave side to insure complete drainage.

**U-63.** Every pressure vessel shall conform in all details with these rules, and when so constructed shall be stamped with the legend provided for in Par. U-66.

**U-64. Hydrostatic Test.** Each vessel constructed under these rules shall be tested under hydrostatic pressure to 50 lb. in excess of the maximum allowable working pressure when same does not exceed 100 lb., and to 1 1/2 times the maximum allowable working pressures above 100 lb., except that vessels with fusion-welded joints shall be tested to three times the working pressure, and enameled vessels shall not be tested in excess of the working pressure.

**U-65.** Every pressure vessel shall be inspected at least once by a state or municipal inspector of boilers, or an inspector employed regularly by an insurance company which is authorized to do a boiler-insurance business in the state in which the vessel is built, and in the state in which it is to be used, if known, which inspection shall be made when the hydrostatic pressure test is on. A data sheet shall be filled out and signed by the manufacturer and the inspector, which data sheet together with the stamping on the vessel, will denote that it is constructed in accordance with these rules. Every pressure vessel fabricated in whole or in part by a welding process, shall, when the size of the shell permits, be internally inspected before being finally closed to inspection.

**U-66.** Each such pressure vessel shall be marked in the presence of the inspector; A.S.M.E. Std. P.V., the class, and with the manufacturer's name and serial number and working pressure. These markings shall be stamped with letters and figures at least 5/16 in. high on some conspicuous portion of the vessel, preferably near a manhole, if any, or handhole. These stamps shall be arranged substantially as follows:

#### A.S.M.E. STD. P.V.

Serial No.....  
Max. W.P.....lb.  
Mfrs. No.....

(Mfrs. Name)

and shall not be covered with insulating or other material. The

symbol authorized for use on power boilers shall not be used on pressure vessels.

#### RULES FOR THE FUSION PROCESS OF WELDING

**U-67. Processes.** The fusion process, so-called, shall consist of welding by means of either the oxy-acetylene process or the electric-arc process, using a metallic electrode, either bare, coated, or covered.

**U-68.** When properly welded by the fusion process, the strength of a joint may be calculated on a maximum unit working stress (S) of 5600 lb. per sq. in. (See Par. U-20.)

**U-69.** The term "base metal" shall mean the metal or metals of which the vessel is constructed and which are joined together by the welded seam.

**U-70. Material for Base Metal.** The base metal shall not exceed 5/8 in. thickness, shall be of good weldable quality, and when of steel shall be made by the open-hearth process, conforming to the requirements of the Specifications for Forge Welding, Pars. U-110 to U-125.

#### CONSTRUCTION

**U-71. Method of Welding.** Longitudinal seams shall be of the double-V type, that is, welded from each side halfway through the sheet. Girth and head seams may be of the single-V type, that is, welded entirely through from the outside. Double-V welds shall be reinforced at the center of the weld on each side of the plate by at least 25 per cent of the plate thickness. Single-V welds shall extend entirely through the plate and shall be reinforced at the center of the weld by not over 20 per cent of plate thickness. All welds shall be of sound metal, thoroughly fused to the sides of the V its entire depth. Sheets must not be allowed to lap during welding. In material 1/4 in. or less in thickness, the longitudinal seams need not be beveled. In material less than 1/4 in. thick, beveling the heads will be sufficient, and the shell need not be beveled at the head seams. One side of each girth seam shall be beveled.

There shall be no valley either at the edge or in the center of the joint, and the weld shall be so built up that the welded metal will present a gradual increase in thickness from the surface of the sheet to the center of the weld.

At no point shall the sheet on one side of the joint be offset with the sheet on the other side of the joint in excess of one-quarter of the minimum thickness of the sheets, or plates.

**U-72. Longitudinal Joints.** Where vessels are made up of two or more courses with welded longitudinal joints, the joints of adjacent courses shall be not less than 60 deg. apart.

**U-73. Distortion.** The cylinder or barrel of a vessel shall be substantially circular at any section, and to meet this requirement shall be reheated, rerolled or reformed.

**U-74. Dished Heads.** Dished heads convex to the pressure shall have a flange not less than 1 1/2 in. long and shall be inserted into the shell with a driving fit in excess of the full length of the flange welded to the shell with a V'ed weld, heated to the annealing point, the shell to be constricted on the end to a diameter not less than 1 in. smaller than the original diameter.

Dished heads concave to the pressure shall have a length of flange not less than 12 per cent of the diameter for shells 24 in. in diameter or less, but in no case less than 1 in. For vessels over 24 in. diameter this length shall be not less than 1 1/2 in.

**U-75. Hemispherical Heads.** Hemispherical heads concave to the pressure shall have a flange not less than 1 in. long, and shall be attached to the cylinder by a butt weld.

**U-76.** Nozzles in heads or shells not to exceed 12 in. nominal diameter shall be of forged or rolled steel, and shall be formed and welded in accordance with Fig. U-3a. The nominal diameter of the nozzle shall not exceed one half the nominal diameter of the shell.

**U-77.** Threaded connections shall be made as shown in Fig. U-3b to U-3j. In all cases threaded connections shall be not less than extra-heavy pipe size, and shall be set into the shell plate with sufficient clearance to allow of thorough fusing completely through the shell plate, V'ing out the shell plate for this purpose, if necessary.

**U-78. Hydrostatic and Hammer Tests.** While subject to the hydrostatic pressure herein before specified, a thorough hammer or impact test shall be given. This impact test shall consist of strik-

ing the sheet on both sides of the welded seam a sharp vibratory blow with a 2- to 6-lb. hammer with a handle similar to a blacksmith's striking hammer, the blows to be struck 2 to 3 in. apart and within 2 to 3 in. of, and on each side of, the seam—the blows to be as rapid as a man can conveniently strike a sharp, swinging blow, and as hard as can be struck without indenting or distorting the metal of the sheet. During this test the shell shall be completely filled with water.

**U-79. Defective Welds.** Welded seams, or joints, which do not pass this test without leaks, distortion, or other signs of distress, shall be corrected and a further test applied which shall be successfully passed before the vessel is accepted. Defective sections of a welded seam may be cut out and rewelded provided the value of the sheet has not been definitely lowered.

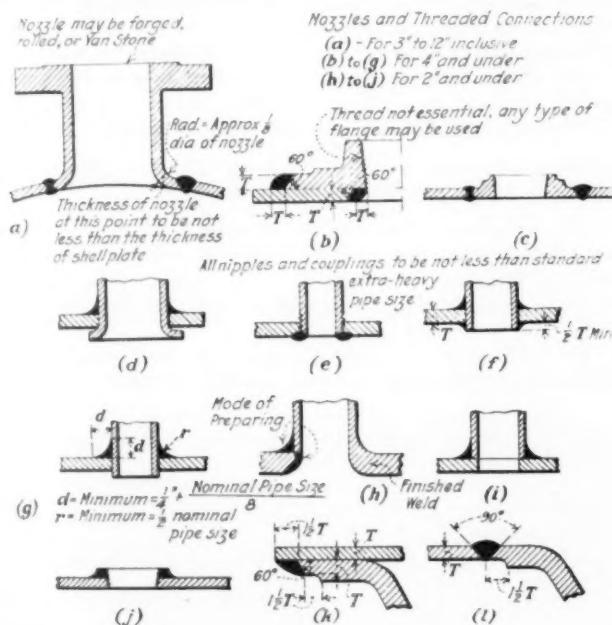

FIG. U-3 METHODS OF AUTOGENOUS WELDING NOZZLES

#### RULES FOR FORGE WELDING

**U-80.** The plate for any part of a forge-welded vessel, on which welding is done, shall be of forge-welding quality in accordance with the Specifications for Forge Welding, Pars. U-110 to U-125.

#### Construction

**U-81.** The minimum thickness of any shell plate shall be  $\frac{1}{4}$  in., but the thickness of shell plate shall be not less than the inside diameter of the vessel divided by 200.

**U-82.** When properly welded by the forging process the strength of a joint may be calculated on maximum unit working stress  $S = 7650$  lb. per sq. in. (See Par. U-20.)

**U-83. Corner Radius of Dished Heads.** The corner radius of a dished head measured on the concave side of the head, shall be not less than 6 per cent of the inside diameter of the head (see A, Fig. U-4a).

**U-84. Depth of Flange.** The depth of flange on the flanged and dished head measured from a point tangent to the corner radius of the head to the end of the flange, shall be not less than 5 in.

**U-85. Heating.** The heating agent shall be suitably prepared water gas or other heating medium by which equivalent or superior results will be obtained, and shall be applied to both sides of the section and adjacent surfaces, and precaution shall be taken to see that the flame is of a character that will minimize the possibility of burning or oxidizing the metal and that it be free from all impurities which would tend to introduce foreign elements into the steel. The temperature of the flame for heating the surfaces shall be under constant and close control.

**U-86. Welding.** The edges that are to be welded together shall be lapped a distance at least equal to the thickness of the plate to be welded. All plates  $\frac{7}{8}$  in. thick and under shall be welded without scarfing; plates more than  $\frac{7}{8}$  in. thick, if desired by the manufacturer, may be scarfed, the scarf to start at least one-half the thickness of the plate from the side next to the weld (see A, Fig. U-4d). When the material has been brought to the proper welding temperature, it shall be placed between an anvil and a hammer, or between rolls, or mandrel and roll, or between mandrels, and the plates welded together by a pressure applied by the hammer, rolls, or mandrels, which will actually displace the material while the welding action is occurring. The metal in and adjacent to the weld shall not be worked at what is termed the critical blue-heat temperature of the steel, that is, between about 400 and 800 deg. Fahr.

The thickness of the weld for all longitudinal and circumferential seams or special welds (see Fig. U-4d) shall be as follows:

$$\begin{aligned} \text{Minimum} &= t \\ \text{Maximum} &= t \text{ plus 15 per cent} \end{aligned}$$

The contact line of completed forge weld shall be equal to at least two and one-half times the thickness of the plate ( $t$ ) as shown at (d), Fig. U-4.

**U-87. Annealing.** After welding, the whole vessel or cylinder shall be heated to a temperature sufficient to remove the internal strains and then allowed to cool slowly in the air. Where this is impracticable on account of size or shape of vessel, all longitudinal and transverse welds shall be heated to the proper temperature for not less than 8 in. on each side of weld and allowed to cool slowly in the air. If any vessel has been distorted or deformed, it must be reformed and then annealed or reformed at a proper annealing temperature. In a finished cylindrical shell the variation in diameters shall not exceed 1 per cent of the mean outside diameter when measured at any section. When a straight edge two diameters long is laid longitudinally on the outside of a shell, it shall be possible to so set the straight edge that no part of the edge will come farther than 1 per cent of the mean outside diameter from the outer surfaces of the shell.

**U-88. Inlet and Outlet Connections.** All connections less than 5 in. standard pipe size may be attached by fusion welding as specified in the code for fusion welding (Pars. U-76 and U-77). Nozzles 5 in. and over shall be attached by forge welding or by riveting.

Nozzles which are attached by forge welding shall be of forged or rolled steel material, seamless tubing or forge-welded pipe, using either of the two methods shown at (b), Fig. U-4 or attached to a head by forge welding as shown at (a), Fig. U-4. Either the nozzle or shell may be flared for this purpose.

**U-89.** Saddle flanges may be used if made of forged steel and may be attached by forge welding by either of the two methods at (c), Fig. U-4, or by riveting.

**U-90.** All dished heads may be attached to shell by forge welding

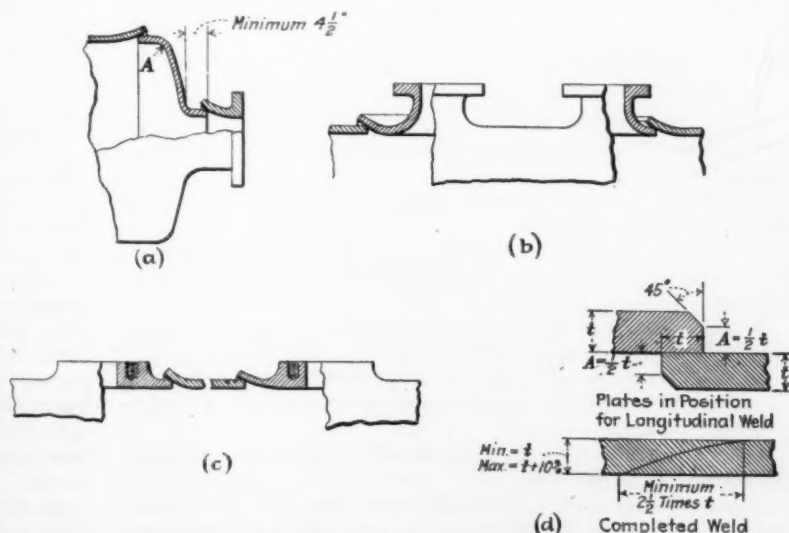

FIG. U-4 METHODS OF FORGE WELDING

as shown at (a), Fig. U-4, or by riveting. (Note corner radius  $A$  referred to in Par. U-83.)

#### RULES FOR BRAZING

**U-91. Material.** Steel plates for the shells of brazed vessels shall be made by the open-hearth process and shall not exceed  $\frac{3}{8}$  in. in thickness. Plates  $\frac{1}{4}$  in. thick or heavier shall be of either flange or firebox quality as provided for in the Specifications for Steel Boiler Plate. Sheets lighter than  $\frac{1}{4}$  in. shall have the properties as provided in Pars. U-126 to U-131.

**U-92.** When the safety of the structure does not depend upon riveting in the joints, rivet holes may be punched full size.

**U-93.** For threaded openings, if the thickness of material in the pressure vessel is not sufficient to give the number of threads specified in Par. U-59, the openings may be reinforced by a plate brazed to the shell, by a forged boss with inside flange welded or brazed to the shell or head, or any of the methods shown in Fig. U-3 may be used.

**U-94.** When properly brazed the strength of a joint may be calculated on a maximum unit working stress  $S = 8550$  lb. per sq. in. (see Par. U-20).

**U-95.** Longitudinal seams shall have the edges of the plate lapped a distance of not less than eight times the thickness of the metal. The lap shall be held closely in position substantially metal to metal, by stitch riveting or other sufficient means. The brazing shall be done by placing the flux and brazing material on one side of the joint and applying heat until this material comes entirely through the lap and shows uniformly along the seam on the other side. Sufficient flux must be used to cause the brazing material to so appear promptly after reaching the brazing temperature. The brazing material used shall be such as to give a joint which has a shearing strength of at least 10,000 lb. per sq. in.

**U-96. Head Seams.** Heads shall be driven into the shells with a tight driving fit, and shall be thoroughly brazed in approximately the same manner as the longitudinal seam for a depth or distance from the end of the shell equal to at least four times the thickness of the shell metal.

#### ENAMELED VESSELS

**U-97. Material.** All pressure vessels intended to be coated with glass or other enamel shall be made of steel or iron not under  $\frac{3}{16}$  in. nor more than  $\frac{5}{8}$  in. in thickness and may be welded by the oxy-acetylene, electric, or forge-welding processes. If forge welding is used the requirements of Pars. U-80 to U-90 shall be followed. All plates shall conform to the Specifications for Steel for Forge Welding, Pars. U-110 to U-125, and any plate not conforming thereto may be rejected.

**U-98.** The maximum allowable working pressure for single-shell vessels shall be determined by the following formula:

$$P = \frac{5000}{R} t$$

where  $t$  = thickness of plate, in.

$R$  = inside radius, in.

**U-99.** The formula given in U-36 shall be used in calculating the minimum thickness of heads necessary for the various pressures and diameters.

**U-100.** The ratio of diameter of the vessel to thickness of plate shall in no case exceed 320.

**U-101.** Any brand of welding wire which has been found by practice to give good results may be used, and may be bare, coated or covered.

**U-102.** Vessels of this class will be considered under two types, viz., single-shell vessels and jacketed vessels.

**U-103.** Longitudinal seams of single-shell vessels welded by either the oxy-acetylene or electric processes or both shall be double-V welded.

The weld on all surfaces to be enameled may be ground flush with the surface of the plate.

**U-104.** Jacketed or double-shell vessels may be of two types, one in which one of the heads of the inner vessel forms the sealer apron for the jacket, and one in which the sealer apron is joined to

the shell of the inner vessel at some point between the heads, forming a partially jacketed vessel.

**U-105.** The inner shell of a jacketed vessel shall be of the same construction as a single-shell vessel.

The thickness of the inner shell shall be at least 1.65 times the required thickness of the outside shell.

**U-106.** The longitudinal seam of the jacket shall be double-V welded. The circumferential seam in the jacket joining the head to the shell may be single-V welded.

**U-107.** In jacketed vessels where the sealer apron is welded to the shell of the inner vessel, and also where sealer apron is welded to the shell of the jacket, the weld may be made from outside only, provided the thickness of the metal deposited is equal to or greater than the thickness of the apron or plate.

**U-108.** In jacketed vessels where the top head of the inner shell forms the sealer apron, the head may be welded to the shell of the inner vessel from the inside only, provided the thickness of the weld after grinding is equal to or greater than the thickness of the shell.

**U-109.** All cylinders shall be rerolled after welding.

#### SPECIFICATIONS FOR STEEL PLATES OF FLANGE QUALITY FOR FORGE WELDING

**U-110. Material Covered.** These specifications cover steel plates of flange quality suitable for forge welding without the addition of fluxes.

**U-111. Process.** The steel shall be made by the open-hearth process.

**U-112. Chemical Composition.** a. The steel shall conform to the following requirements as to chemical composition:

Carbon	for plates $\frac{3}{4}$ in. or under in thickness	not over 0.15 per cent
	for plates over $\frac{3}{4}$ in. in thickness	not over 0.17 per cent
Manganese		0.35 to 0.60 per cent
Phosphorus	Acid	not over 0.06 per cent
	Basic	not over 0.04 per cent
Sulphur		not over 0.05 per cent

b. The composition of the steel should preferably be free from silicon, nickel, or chromium. Where these elements are present the maximum quantity of any one shall not exceed 0.05 per cent.

**U-113. Ladle Analyses.** An analysis of each melt of steel shall be made by the manufacturer to determine the percentages of carbon, manganese, phosphorus, and sulphur. This analysis shall be made from a test ingot taken during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified.

**U-114. Check Analyses.** An analysis may be made by the purchaser from a broken tension-test specimen representing each plate as rolled. The chemical composition thus determined shall conform to the requirements specified.

**U-115. Tension Tests.** a. The material shall conform to the following minimum requirements as to tensile properties:

Tensile strength (T. S.), lb. per sq. in.	45,000
Yield point, lb. per sq. in.	0.5 T. S.
but in no case less than	24,000 lb. per sq. in.
Elongation in 8 in., per cent.	30

b. The yield point shall be determined by the drop of the beam of the testing machine.

**U-116. Modifications in Elongation.** a. For material over  $\frac{3}{4}$  in. in thickness a deduction from the percentages of elongation specified in Par. U-115 (a) of 0.125 per cent shall be made for each increase of  $\frac{1}{32}$  in. of the specified thickness above  $\frac{3}{4}$  in.

b. For material under  $\frac{3}{16}$  in. in thickness, a deduction from the percentage of elongation in 8 in. specified in Par. U-115 (A) of 1.25 per cent shall be made for each decrease of  $\frac{1}{32}$  in. of the specified thickness below  $\frac{3}{16}$  in.

**U-117. Bend Tests.** The test specimen shall withstand being bent cold through 180 deg. without cracking on the outside bent portion, as follows: For material 1 in. or under in thickness, around a pin the diameter of which is equal to the thickness of the specimen; and for material over 1 in. in thickness, around a pin the diameter of which is equal to twice the thickness of the specimen.

**U-118. Test Specimens.** *a.* Tension-test specimens shall be taken longitudinally from the bottom of the finished rolled material, and bend-test specimens shall be taken transversely from the middle of the top of the finished rolled material. The longitudinal-test specimens shall be taken in the direction of the longitudinal axis of the ingot, and the transverse-test specimens at right angles to that axis.

*b.* Tension- and bend-test specimens shall be of the full thickness of material as rolled, and shall be machined to the form and dimensions shown in Fig. U-5; except that bend-test specimens may be machined with both edges parallel.

*c.* Test specimens for plates over  $1\frac{1}{2}$  in. in thickness may be machined to a thickness or diameter of at least  $\frac{3}{4}$  in. for a length of at least 9 in.

*d.* The machined sides of rectangular bend-test specimens may have the corners rounded to a radius not over  $\frac{1}{16}$  in.

**U-119. Number of Tests.** *a.* One tension and one bend test shall be made from each plate as rolled.

*b.* If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

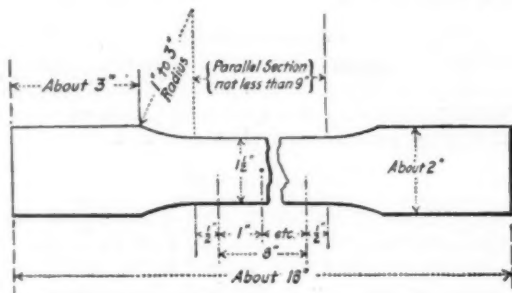

FIG. U-5. STANDARD FORM OF TEST SPECIMEN REQUIRED FOR ALL TENSION TESTS OF STEEL PLATE OF FLANGE QUALITY FOR FORGE WELDING

*c.* If the percentage of elongation of any tension-test specimen is less than that specified in Par. U-115 (*a*) and any part of the fracture is outside the middle third of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

**U-120. Permissible Variations.** The thickness of each plate shall not vary more than 0.01 in. under that ordered.

**U-121. Finish.** The finished material shall be free from injurious defects and shall have a workmanlike finish.

**U-122. Marking.** *a.* The name or brand of the manufacturer, melt or slab number, class, and lowest tensile strength for its class specified in Par. U-115 (*a*) shall be legibly stamped on each plate. The melt or slab number shall be legibly stamped on each test specimen.

*b.* When specified on the order, plates shall be match-marked as defined in section (*c*) so that the test specimens representing them may be identified. When more than one plate is sheared from a single slab or ingot, each shall be match-marked so that they may all be identified with the test specimen representing them.

*c.* Each match mark shall consist of two overlapping circles each not less than  $1\frac{1}{2}$  in. in diameter, placed upon the shear lines, and made by separate impressions of a single-circle steel die.

*d.* Match-marked coupons shall match with the sheets represented and only those which match properly shall be accepted.

**U-123. Inspection.** The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the material ordered. The manufacturer shall afford the inspector, without charge, all reasonable facilities to satisfy him that the material is being furnished in accordance with these specifications. All tests (except check analyses) and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

**U-124. Rejection.** *a.* Unless otherwise specified, any rejection based on tests made in accordance with Par. U-114 shall be reported within five working days from the receipt of samples.

*b.* Material which shows injurious defects subsequent to its acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

**U-125. Rehearing.** Samples tested in accordance with Par. U-114 which represent rejected material shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

#### SPECIFICATIONS FOR STEEL PLATE FOR BRAZING

**U-126.** The steel shall conform to the following requirements as to chemical composition:

Carbon.....	not over 0.24 per cent
Manganese.....	not over 0.60 per cent
Phosphorus.....	not over 0.04 per cent
Sulphur.....	not over 0.05 per cent

**U-127.** Ladle analyses and check tests shall conform to the provisions of Pars. U-113 and U-114.

**U-128. Tension Tests.** The material shall conform to the following requirements as to tensile properties:

Tensile strength, max. lb. per sq. in.....	70,000
Yield point, min. lb. per sq. in.....	28,000
Elongation, min. per cent.....	1,500,000
Tensile Strength	

The elongation shall be measured on gage length of 24 times the thickness of specimen, except that this may be reduced by  $2\frac{1}{2}$  per cent for each  $\frac{1}{16}$  in. under  $\frac{5}{16}$  in.

**U-129. Bend Test.** The bend-test specimen shall bend cold through 180 deg. without cracking on the outside of the bent portion, around a pin the diameter of which is equal to the thickness of the specimen.

**U-130. Number of Tests.** Two tension tests and two bend tests shall be taken from each heat, but not both tension or both bend tests from the same slab.

**U-131.** Sheets less than  $\frac{1}{4}$  in. in thickness shall not be required to be stamped at the mill on account of the small size and light weight of the sheets. The manufacturer must mark each vessel in some permanent manner which will enable him to identify the heat from which the sheet in each tank has been rolled.

## A.S.M.E. Boiler Code Committee Work

*THE Boiler Code Committee meets monthly for the purpose of considering communications relative to the Boiler Code. Any one desiring information as to the application of the Code is requested to communicate with the Secretary of the Committee, Mr. C. W. Obert, 29 West 39th St., New York, N. Y.*

The procedure of the Committee in handling the cases is as follows: All inquiries must be in written form before they are accepted for consideration. Copies are sent by the Secretary of the Committee to all of the members of the Committee. The interpretation, in the form of a reply, is then prepared by the Committee and passed upon at a regular meeting of the Committee. This interpretation is later submitted to the Council of the Society, for approval, after which it is issued to the inquirer and simultaneously published in MECHANICAL ENGINEERING.

Below are given interpretations of the Committee in Cases Nos. 446 and 454-460, inclusive, as formulated at the meeting of September 15, 1924, all having been approved by the Council. In accordance with established practice, names of inquirers have been omitted.

#### CASE No. 446

**Inquiry:** Is it permissible, under the requirements of the Low-Pressure Heating Boiler Section of the Code, to apply crown-bar reinforcement to an oval or arched furnace crown sheet by the use of crown bars welded along their lower edges to the upper surface of the crown sheet? If not, what form of crown-bar reinforcement

is permissible under the Heating Boiler Section of the Code, and under what rule may such construction be calculated?

*Reply:* It is the opinion of the Committee that the construction described will be acceptable for steam heating boilers at pressures not exceeding 15 lb. and for water boilers for any pressure not exceeding 160 lb. where the strength of the crown bars, as calculated in Par. P-230a, is shown to be sufficient, assuming in the formula that  $p$ , the pitch of supporting bolts, is equal to the distance between the crown bars from center, and  $C$  is equal to 12,000.

#### CASE No. 454

*Inquiry:* a Must a water-relief valve be attached immediately to hot-water boilers; if so, would a nipple and coupling between the valve and the boiler be considered as immediately attached?

b Would a valve with a rubber diaphragm be acceptable?

c Would a valve with a rubberseat disk be acceptable?

d Would a valve with a waterway through a number of smaller openings in the aggregate which are equivalent to the required area be acceptable?

*Reply:* a A connection not exceeding 6 in. in length and having a minimum cross-section not less than the nominal area of the relief valve required, will be considered by the Committee as being connected "as closely as possible" as required in Pars. H-46 and H-99.

b and c It is the opinion of the Committee that while Par. H-44 states that the valve shall be of the diaphragm-operated type, the Committee undoubtedly felt that a diaphragm of rubber or composition that was liable to fail, due to deterioration or vulcanizing when subjected to highly heated water or steam, would not be used. That being the case, the Committee recommends that materials of this nature be not used, for the seat disk nor should they be used for the diaphragm in diaphragm-operated valves under such conditions, for example, where the steam or hot water passes under the diaphragm.

d It is the opinion of the Committee that a valve exceeding  $1\frac{1}{2}$  in. nominal diameter may have multiple ports if such ports are each not of less area than that of a  $1\frac{1}{2}$ -in. valve.

#### CASE No. 455

*Inquiry:* Is it to be understood from Par. P-216, which states that the part of a tube sheet which comes between the tubes and shell of a boiler need not be stayed if the maximum pitch does not exceed  $1\frac{1}{2}$  times the maximum pitch of staybolts for the corresponding thickness and pressure given in Table P-6, that it can be interpreted to mean that  $1\frac{1}{2}$  times the pitch as determined by the formula given in Par. P-199 may be used, which will allow a much greater spacing when using heavy heads?

*Reply:* It is the opinion of the Committee that it will not be permissible, under Par. P-216, to determine the maximum pitch from the formula in Par. P-199, but that instead reference must be made to the maximum allowable pitches in Table P-6 and Par. P-204.

#### CASE No. 456

*Inquiry:* Is it necessary, under the requirements of Par. P-324, to so locate the supporting lugs of h.r.t. boilers when they are of pressed-steel construction and of a triangular form, that the adjacent corners are not over 2 in. apart, whereas due to the triangular form it would be impossible to locate the edges of the bearing surfaces 2 in. apart?

*Reply:* It is the opinion of the Committee that the requirements of Par. P-324 will be met if lugs of the form described are so located on the boiler shell that their adjacent corners are not over 2 in. apart.

#### CASE No. 457

*Inquiry:* Will it not be permissible in the construction of dry-back Scotch-type boilers to locate the fusible plug at a lesser distance than 2 in. above the upper row of tubes where the distance between the uppermost line of tubes and the top of the steam space is 13 in. or less, as is provided for h.r.t. and economic-type boilers in Pars. A-21a and A-21r?

*Reply:* In applying Par. A-21q, it is the opinion of the Committee

that where the size of the boiler is such that the distance between the top line of tubes and the top of the steam space is not over 13 in., the same provisions as given for h.r.t. boilers in Par. A-21a may be allowed.

#### CASE No. 458

*Inquiry:* Inquiry is made as to whether, under the requirement of Par. P-277 of the Code, it is permissible to connect both the steam delivery pipes and the safety valve to the boiler through the customary four-way or "niggerhead" fitting as is used in oil-country practice?

*Reply:* It is the opinion of the Committee that under the requirements of Par. P-277, it will be necessary to attach the safety valve or valves to the boiler through an entirely independent connection from that used for the steam delivery connection.

#### CASE No. 459

*Inquiry:* An interpretation is requested as to the requirements of the Boiler Code for longitudinal joints of Adamson-type furnaces, as the Code apparently specifies the types of longitudinal joints for use in plain furnaces only.

*Reply:* Attention is called to the fact that Pars. P-239 and P-240 apply to all types of unstayed furnaces, so that the provisions therein for the construction of longitudinal joints of such unstayed furnaces apply generally to the Adamson type as well as to all other types of unstayed furnaces, whether vertical or horizontal.

#### CASE No. 460

*Inquiry:* a If safety valves in sizes 3 in. or less for boilers operating at a working pressure of more than 15 lb. and not more than 125 lb. are provided with flanged inlets, must these flanges be extra heavy, or can they be standard dimensions and standard drilling?

b If two safety valves in sizes 3 in. or less are mounted on a Y base, must the inlet flange of the Y base be extra heavy, or can it be standard dimension where the working pressure does not exceed 125 lb.?

*Reply:* a Under Par. P-286, if the safety valves are of 3 in. or less in size, standard dimensions and standard drilling may be used.

b The outlet flanges on a Y base for connection to safety valves 3 in. or less in size may be of standard dimensions and standard drilling, but if the base flange of the Y is over 3 in. in diameter it would be necessary to make it extra heavy as provided for in Par. P-286.

### National Conference on Aeronautical Nomenclature

THE National Conference on Aeronautical Nomenclature, organized by the National Advisory Committee for Aeronautics, held the first of a series of meetings in Washington on October 29 in the office of the latter committee. The meeting was called by Dr. Joseph S. Ames, Chairman of the Conference, pursuant to a general demand for a revision of aeronautical nomenclature which was formally recognized at a recent meeting of the National Advisory Committee for Aeronautics. So many new and conflicting aeronautical terms have come into use that a general conference of representatives of the Army and Navy air services, engineering societies, and the aircraft industry had become necessary in order to standardize the new language of the air.

The Conference, at which President-elect Wm. F. Durand represented the A.S.M.E., was organized into four sub-committees dealing with airship terms, engine terms, airways, and aerodynamics.

One term which provoked much criticism at the session was the more or less general misuse in the newspapers of the word "dirigible" when referring to an airship. It was pointed out that the *Shenandoah* and the *ZR-3* are "dirigible" airships, dirigible being used only as an adjective to distinguish between airships whose flight is controllable and those that are at the mercy of the winds, such as balloons.

# Correspondence

**CONTRIBUTIONS** to the Correspondence Department of "Mechanical Engineering" are solicited. Contributions particularly welcomed are discussions, of papers published in this journal, brief articles of current interest to mechanical engineers, or comments from members of The American Society of Mechanical Engineers on articles or policies of the Society in Research and Standardization.

## A Plea for Circular, Cylindrical, and Spherical Units of Measurement

TO THE EDITOR:

You have asked me to describe the application of the circular inch in the measurement of fluids in cylindrical vessels and pipes, and I am accordingly giving you the following outline for the consideration and criticism of the members and readers of MECHANICAL ENGINEERING. I shall be greatly pleased to go into further details if called upon by the interest of your readers.

I am suggesting to the engineering profession not only the adoption of a circular unit for measuring areas of round containers, but also a cylindrical unit for measuring the corresponding volumes of those containers and a spherical unit for measuring volumes or cubical contents of ball-shaped bodies.

For a number of years I have used the circular unit of area in calculations of flow measurement through various sizes of pipes and have found it very simple and advantageous in every respect. I have adopted the circular inch as a basis for the English system and the circular centimeter as a basis for the metric system. This unit is similar to the circular inch employed for the measurement of electrical wire conductors.

My tables for the various sizes of pipes contain the internal diameter in inches and the internal section in circular inches, which latter unit is simply the internal diameter squared. As I stated once in my discussion on orifice coefficients, it is rather unfortunate that this method is not adhered to by all the manufacturers of fluid meters, as it deprives the user of the advantage of visualizing the flow through the orifice as compared to the flow through the pipe.

When I think of a 5-in. orifice in a 10-in. pipe I see before me a jet of 25 circular inches as compared with an extension of 100 circular inches, and which is 25 per cent of the total area. I cannot imagine a jet as a diameter, but as a diameter squared. I will add now that I cannot imagine a jet issuing from a circular opening as a square at all, but as a circular area of the diameter squared.

After trying this method of figuring for a number of years and demonstrating its advantages, I came to the conclusion that the same method could easily be adopted by the engineering profession in general for the measurement of the cubical contents of cylinders by the corresponding cylindrical unit, and the cubical contents of spheres by the corresponding spherical unit. This would greatly simplify the calculations of the quantities involved; it would make the comparison of magnitudes more natural; and it would in no way interfere with the conversion to the present flat-area square and cubical system.

It can be readily seen that nature, in the very beginning, did not intend to measure circles, cylinders, and spheres by a flat unit; otherwise she would have provided a commensurable ratio between the circle and the four-cornered square. I am sure that the four-cornered square or eight-cornered cube was adopted as a unit as a result of the belief at that time that the earth was a four-cornered flat surface with the sky attached to the square sides which surrounded it. Since we have learned now that nature, of her own accord, creates mainly spherical and circular bodies, there is no reason why the units of measurement bringing to the mind the ratio of magnitudes of these bodies should not be of the same circular or spherical type.

I am sure the adoption of these units for the particular purposes will give immediate relief from tedious calculations at the very start. It is only proper that water supply should be measured in so many cylindrical feet of water, and that gas supply should be measured

in so many cylindrical feet of gas. In either case the fundamental test of the measuring device is made by comparing it with a cylindrical container in the form of a holder or tank. It is well known that the transfer to the eight-cornered cubical unit involves tedious computations and certain inaccuracies inherent in the transfer.

Supplies of water or of gas are usually accumulated in cylindrical tanks and are conveyed therefrom in cylindrical pipes, and it is odd indeed that both the conveyors and the holders should be first transferred to inconvenient measures of imaginary squares and then compared with each other on that basis instead of carrying out the comparison at all times on the natural basis of cylindrical units.

The adoption of the spherical unit would offer still greater advantages in the measurement and comparison of spherical bodies. How expedient it would be to state that the spherical contents of the earth should be equal to  $8 \times 10^9$  spherical miles, which would be the diameter cube of the earth in miles. It would give an immediate comparison with a sphere one mile in diameter, and if some one were interested in finding out what the cubical contents of the earth would be in units of the eight-cornered cubical system, he would simply have to multiply the number of spherical units by  $\pi/6$ , which cannot be given as an exact figure but which is very close to 0.5235987756. . . . . This would be the only time any one would have to worry about the use of the Greek letter  $\pi$ , which has no exact equivalent in our numerical system.

In conclusion, I wish to state that the introduction of the circular, cylindrical, and spherical units into our system of measurement would not involve any difficulties even at the very start. All it requires is a plain, ordinary definition of these units and their adoption for practical purposes. It is so easy to see that the area of a circular foot contains  $12 \times 12$  or 144 circular inches; the volume of a cylindrical foot contains  $12 \times 12 \times 12$  or 1728 cylindrical inches; and the volume of a spherical foot contains  $12 \times 12 \times 12$  or 1728 spherical inches.

If this system should be adopted, all the numerous tables in the various handbooks giving the square and the cubical contents of circular and spherical bodies, would be replaced by one simple rule: namely,

To change a quantity from circular or cylindrical to square units, multiply by  $\pi/4$ ; and vice versa, to change a quantity from square to circular or cylindrical units, divide by  $\pi/4$ . To change a quantity from spherical to cubical units, multiply by  $\pi/6$ ; and vice versa, to change a quantity from cubical to spherical units, divide by  $\pi/6$ .

With this provision, all quantities would be easily computed as squares and cubes of the given diameter and the Greek letter  $\pi$  would be very, very seldom used, if at all.

## Proposed Standards for Herringbone Gears

TO THE EDITOR:

The writer wishes to call attention to certain points relating to the properties of the steels in the Report on Proposed Standards for Herringbone Gears for General Commercial Use.<sup>2</sup>

In a letter from Frank A. Mickle and Charles W. Good, published in MECHANICAL ENGINEERING for October, 1924, a table is given for the properties of steels, which they state to have been compiled from the Proposed Standards, with additional information from S.A.E. specifications. The additional information relates to the yield points of three grades of steels drawn at two

<sup>1</sup> Vice-President, Republic Flow Meters Co. Mem. A.S.M.E.

<sup>2</sup> Prepared by the Sectional Committee on the Standardization of Gears for which the American Gear Manufacturers Association and THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS are joint sponsors. In an early form this report was printed in MECHANICAL ENGINEERING for February, 1923.

temperatures, respectively, and the factor of safety for materials drawn at 1300 deg. Fahr. The yield points purport to be derived from S.A.E. specifications, but in most cases the figures cannot be checked, and appear to have been modified.

There is no chart of heat treatments and properties for S.A.E. steel 3245. There are, however, charts for S.A.E. steels 3240 and 3250. The figures given by Messrs. Mickle and Good correspond closely to those given in the chart for S.A.E. 3250 steel.

It is not clear why S.A.E. steel 1045 should be referred to as 50 C as the mean is 0.45 carbon. The next grade (S.A.E. 1030) is designated as 30 C steel and the mean is 0.30 carbon. In the case of steel 1045 the figures are the same as those shown in the S.A.E. chart.

In the case of S.A.E. steel 1030 there is no S.A.E. chart, but there are charts for 1025 and 1035. The properties shown by Messrs. Mickle and Good's letter, more nearly conform to the higher grade of steel than to the lower.

In the table below is given a comparison of the figures shown by Mickle and Good with certain figures which have been taken from S.A.E. charts.

S.A.E. Steel No.	Source of Information	Yield Point	
		Drawn 1300 deg. Fahr.	Drawn 800 deg. Fahr.
3245	Mickle and Good	98,000	200,000
3250	S.A.E. Chart	96,000	199,000
3240	S.A.E. Chart	86,000	180,000
3245	Mean of 3250 and 3240	91,000	189,500
1045	Mickle and Good	62,000	80,000
1045	S.A.E. Chart	62,000	80,000
1030	Mickle and Good	50,000	75,000
1035	S.A.E. Chart	51,000	66,000
1025	S.A.E. Chart	40,000	65,000
1030	Mean of 1035 and 1025	45,500	65,000

The writer realizes that in the case of S.A.E. 3245, taking the mean of the figures for 3240 and 3250 is not necessarily accurate, but since there is no S.A.E. chart for the grade of steel under consideration this is much more fair than to take the figures from some other grade, particularly when a grade so selected has higher properties. The same is true in regard to the figures for S.A.E. 1030.

If the figures given by Mickle and Good are based on actual tests of gears or other material made in the course of the investigation it would appear preferable to have it so stated and not refer to the S.A.E. charts, since the figures do not correspond. It is perhaps unnecessary to call attention to the fact that the S.A.E. charts are prepared with a view to showing the properties which could be expected of bars up to 1½ in. diameter or square, and does not apply to larger sizes.

Naturally any change in the figures for the yield point would be reflected in those of either *S* or the factor of safety.

## The Mechanical Meaning of Hardness Numbers<sup>1</sup>

TO THE EDITOR:

It is very often said that values in which the property of hardness is measured on different hardness scales are arbitrary and not correlated among themselves.

It is true that only approximate correlation exists between hardness numbers obtained on different scales, and even that correlation is often applicable only to a limited range of hardness values. However, practically all well known methods of measuring hardness like impact, Brinell, Shore scleroscope, and Rockwell have a common mechanical meaning. This meaning is the resistance of the material to a permanent displacement of its particles, and the hardness numbers are measures of that resistance.

The impact method of measuring hardness was systematically investigated by Colonel Martel, who described it in the report of the "Commission des méthodes d'essai des matériaux de construction," 1895, 1<sup>re</sup> session, 3-4, p. 261. By Martel's method hardness is measured as resistance of a material to the permanent deformation produced by a falling weight provided with an indenting tool.

Martel's hardness number =  $Ph/v$ , where  $P$  = weight,  $h$  =

<sup>1</sup> Published by permission of the Director of the Bureau of Standards of the U. S. Department of Commerce.

height of fall, and  $v$  = volume of indentation. Thus Martel's hardness number is the specific work necessary to produce a unit-volume indentation. Martel was the first to give a scientific definition of the quantity represented by this hardness number, but essentially the same method has been in use for a long time in France, Austria, and Italy.

Professor Unwin (*Engineering*, vol. 105, p. 535, 1918), has shown that theoretically, at least, Martel's hardness number is identical with that of Brinell. The differences between the two might be explained by the losses accompanying the impact.

Professor Edwards (*Proc. Inst. Mech. Eng.*, 1918-I, p. 335), studied the correlation between the impact hardness number and a static Brinell hardness number. The results of this investigation have shown that there is a straight-line relation between the diameter of impact indentation (produced by a constant impact energy of 63 in-lb. and a Brinell diameter (3000-kg. load and 10-mm. ball).

It was found also that there is a definite relation between the Brinell hardness number (B.h.n.) and the diameter ( $d$ ) of impact indentation, namely,  $B.h.n. = 7582/d^2$ . Professor Edwards stated, however, that a rebound method (scleroscope) can only be expected to give a regular scale if the amount of energy is so adjusted that the same amount of penetration is obtained in all tests. The deformation itself is so small that the height of rebound is materially influenced by the nature of the surface and by the internal structure of metal. It is evident that in a scleroscope test the hardness number represents the energy of rebound and, as the impact energy is constant, the scleroscope number represents indirectly the amount of energy absorbed in indenting material.

In the case of Rockwell hardness number (R.h.n.) we have the following equation:

$$R.h.n. = C - \delta \dots \dots \dots [1]$$

where  $C$  is a constant and  $\delta$  is the depth of indentation.

The indentation of the specimen is accompanied by the deformation of the frame of the machine and it may, generally, be assumed that this deformation is proportional to the load on the test piece. Therefore, the energy of producing an indentation is equal  $P\delta/2$ , where  $P$  is the load, and Equation [1] may be written thus:

$$R.h.n. = \frac{2}{P} \left( \frac{CP}{2} - \frac{P\delta}{2} \right) \dots \dots \dots [2]$$

Equation [2] gives R.h.n. as a function of the expression  $\frac{CP}{2} - \frac{P\delta}{2}$

The first term of this expression is the energy which would be required to make an indentation on the softest material whose hardness can be measured on the Rockwell scale, that is, whose Rockwell hardness number is zero. In a way, it might be called the available energy of the Rockwell machine.

The second term,  $P\delta/2$ , is the energy which goes into making an indentation in a given material.

Thus, the Rockwell hardness number is proportional to a quantity which may be called the remaining energy of the machine. There is an analogy, therefore, between a Rockwell hardness number and a scleroscope number.

Thus, notwithstanding the multiplicity and seeming conventionality of hardness values, they all tend in one way or another to measure the energy which a material absorbs when it is indented. However, no definite relation, expressible by a conversion formula, can always be expected between the different hardness numbers. Generally speaking, different hardness numbers may be expected to be convertible one into the other only when the amount of displaced material and the depth of penetration are the same in each case.

The practical difficulties involved in fulfilling this requirement are so great that it is impracticable to overcome them in hardness testing in the shop or laboratory.

# Engineering and Industrial Standardization

## Specifications for Steam Turbines

THROUGH the American Engineering Standards Committee and the Czechoslovakian national standardizing body, the A.S.M.E. has just received a Standard Specification for Steam Turbines (in English), covering in eight mimeographed pages the following points:

- A. Figures Guaranteed by the Contract: Rating, steam consumption, speed regulation, safety of operation, and items supplied
- B. Units
- C. Testing: Object of the test, time and expense of the tests, gages and arrangement of the unit for the test, general requirements of tests, measuring of steam consumption, measuring pressure and temperature, and figuring results and report.

## New Standards for Wire Rope

AN IMPORTANT set of draft standards for wire rope has been published for criticism by the Swiss in their journal, *Technik und Betrieb*. This topic is one which is now being studied in this country by a Sectional Committee, in connection with the standardization program of the American Mining Congress going forward under the American Engineering Standards Committee's auspices. It is not unlikely that later on this work will develop into a broad project for standardization of wire rope for all uses.

The Swiss draft standards include a general and theoretical discussion of wire ropes, including definitions, standards designations, and formulas for calculation; and designs of wire ropes for general use, and for elevators, cranes and pulley blocks. The standards include besides complete dimensional design of the ropes, working limits, and methods of calculation.

The only other important standards for wire ropes are those of the Belgians, published in November, 1922; of the Germans, published in October, 1923; of the Canadians published in 1921, and of the Transvaal Chamber of Mines, which date back to April, 1919.

## Czechoslovakia Makes Progress in Standardization

"INDUSTRIAL-STANDARDIZATION work has attained a very high development in Czechoslovakia, where the national standardizing body, although only about a year old, has already under way some two hundred standardization projects. It has fifty committees and sub-committees actively at work, including a membership of about seven hundred individuals, which is not far below the number engaged in this work under national auspices in the United States." This information is contained in an article appearing in a Bulletin which the American Engineering Standards Committee issued some little time ago. It proceeds:

"Interesting instances of the need for standardization are recounted by B. Rosenbaum, director of the Czechoslovakian national standardizing body, in a paper read before the First International Management Congress recently held in Prague. He reports forty different types of small rails varying from  $1\frac{3}{4}$  to  $3\frac{1}{4}$  inches in height. Likewise, during nine years a single firm manufacturing cars for mine railways and industrial trackage reports having filled orders for cars involving 76 different railway-track gages. The same firm has a thousand different patterns for wheels for such cars.

"It is expected that in the case of small rails, five or six types will likely replace the 40 now in use, and that five track gages, including the international gages for street and steam railways, will replace the 76 cited in this second example. Instead of a thousand different wheel patterns, it is expected that nine wheels of a heavy type and nine of a light type will cover all requirements. Following this simplification of designs and stocks it will be possible to make a successful beginning in the equally important

problem of standardizing axles, bearings, and other associated parts."

## Standardization of Pattern and Flask Equipment

SOME years ago several members of the American Foundrymen's Association conceived the possibility of standardization of certain foundry equipment as a means of greater savings in the cost of producing castings, particularly as applied to the making of molds and cores by the machine method. Molding machines had been developed and had been on the market for a number of years, and although their use had increased production and lowered the cost in many shops, still there seemed to be an opportunity to increase the savings very materially by serving these machines better. The result was the formation of a committee to investigate the standardization of pattern equipment. The committee also saw the desirability of uniform practice in certain phases of patternmaking.

This committee work progressed and the American Foundrymen's Association was soon able to interest other societies of the metal trades in its work. In due time a new joint committee was formed. Seven other national organizations lent their coöperation, and the work became one of great possibility with widespread support. The following national organizations appointed two representatives each: American Foundrymen's Association; American Institute of Mining and Metallurgical Engineers, American Malleable Castings Association, American Society for Testing Materials, Foundry Equipment Manufacturers Association, National Association of Pattern Manufacturers, National Association of Purchasing Agents, and Steel Founders Society.

In 1923 E. S. Carman, of The Osborn Manufacturing Company, of Cleveland, Ohio, was appointed general chairman. In the spring of 1924 plans were made to aid the general chairman materially in the preliminary work and a secretary for the joint committee was secured. Through the aid of this full-time assistant, a satisfactory start was made on the tentative plans.

The general chairman has divided the preliminary work into three parts. These consist of: (1) Patternmaking and marking; (2) Pattern plates and mounting; and (3) Flask sizes and details. In order to deal with the specific details of the work as classified above, three sub-committees have been formed with a chairman and four or five members each. As the preliminary details are completed they are sent to the respective sub-committees for criticism, suggestion, or approval. The preliminary work consists in preparing questionnaire sheets in the form of drawings and tabulations of the tentative proposed standards for each of the three subdivisions as outlined above. These are made up in as concise a form as possible in order that too much time will not be consumed in answering them. The sub-committee members, together with the original members of the joint committee who represent the eight national trade associations aforementioned, comprise what is termed the general committee or committee of the whole. The questionnaire sheets are first criticized by the general committee, including the comments and recommendations made before by sub-committee members. The approval of the general committee being granted, the questionnaire sheets would be revised and sent to a large number of foundries whose current practice is representative of the best. Spaces are provided in the questionnaire sheets for recommendations where the standards proposed by the joint committee are not approved. The information thus obtained would again be referred first to sub-committees and then to the general committee for further discussion. Thus, as a result of this procedure the standards decided upon would be recommended for adoption.<sup>1</sup>

<sup>1</sup> It is suggested that the full advantage of this important piece of work would be secured to industry by developing the joint committee into a Sectional Committee organized under the procedure of the American Engineering Standards Committee.

## What the Last Decimal Can Tell

IT HAS BEEN found in many instances that materials which give a comparatively low Brinell test offer obstacles to cutting of a character encountered chiefly with hard materials, a fact which is puzzling to say the least. Recent work on Rockwell and Brinell hardness testing carried out at the Massachusetts Institute of Technology and reported in a paper before the American Society for Steel Treating by Prof. Irving H. Cowdrey, of the Massachusetts Institute of Technology, throws some light on this situation by showing that not only can adjoining spots of the same material be of widely varying hardness, but that different spots even within the confines of the same crystal are not always of the same or nearly the same hardness.

This was discovered simply by a greater precision in measurement, namely, by measuring hardness over comparatively small areas rather than employing a previous method of measurement which gave an integrated value over a larger area. This is one more indication of what might be called the revelation of the last decimal point. There have been numberless instances in science and engineering in which a greater precision in measurement or in calculation has either explained phenomena which were puzzling previously or revealed unsuspected conditions.

A brilliant illustration of this is offered by Lord Ramsay's classical investigation of the weight of nitrogen obtained from air by the removal of oxygen and other then known gases, and of nitrogen obtained from chemical compounds. Carried to a high state of precision these measurements revealed a hitherto unsuspected difference between the two weights, which ultimately led to the discovery of the valuable inert gases, argon, neon, xenon, and krypton. Similar high-precision measurements of weights of metals and metalloids obtained in different ways, carried out in particular on lead and chlorine, have helped to establish the theory of isotopes, i.e., the occurrence of chemical elements in more than one structural form, a discovery which is gradually helping to revolutionize our whole conception of the structure of elements and their interrelations.

With the increase in use of high pressure and high temperature, steam engineering is gradually approaching, and in some cases has already passed, the limit where steam may be considered as simply  $H_2O$  in the form of vapor, exclusively subject to the laws defining the relations of volume, pressure, and temperature for imperfect

gases. We are entering a field where more complicated laws affecting the molecular composition of the vapor and the stability of its constitutional structure become active, and it is only the last decimal in the measurement of the properties of steam and its behavior under these temperature and pressure conditions that is likely to give true information.

## Storage of Coal

THE Report of the Committee on Storage of Coal has been recently issued by the Ronald Press in book form under the title *Industrial Coal: Purchase, Delivery and Storage*. This Committee was appointed by the American Engineering Council to investigate the seasonal storage of coal and the effect of such storage in stabilizing the industry. Work started in May, 1923, and a summary of the final report appeared in *MECHANICAL ENGINEERING* and other technical papers during August, 1924. Over 400 engineers serving on 67 sub-committees throughout the country contributed to this survey, which is nationally representative.

The issue of the complete report in book form emphasizes again the recommendation of the Committee that all coal consumers purchase their coal on an annual contract for yearly requirements with the provision that the coal be delivered monthly in equal allotments, and further that each consumer provide necessary storage facilities to meet the terms of such a contract. The Committee points out that the monthly delivery basis will permit the mines and carriers to maintain regular schedules, that sufficient stocks of coal will automatically accumulate during the summer months to care for winter consumption, and that a reduction of price will be made possible by regularity of schedule and consequent elimination of peak demands in winter when production and transportation costs are highest.

The solution of the problem is apparently in the hands of the consumer. The editorial comments of the daily press indicate that in this respect the emphasis of the report is appreciated, but there is still much room for greater comprehension and action based on understanding if the urge of the Committee recommendation is to bring results in the coal industry.

The book contains a great deal of pertinent material to the problem of coal storage, and it will be reviewed at length in the January issue of *MECHANICAL ENGINEERING*.

## A Hero of Peace

THE master builder of tunnels, Clifford M. Holland, is dead. His life was short, his achievements great. At the age of thirty-six he was chosen chief engineer of the greatest subaqueous tunnel project in the world. At the age of forty-one, on the eve of the final "holing through" of this project, Clifford M. Holland paid the price of intensive devotion to duty, night and day, for five years. His heart, overstrained while a member of the Harvard crew and weakened by work in compressed air—necessary on the job he had undertaken—failed him, and a hero of peace passed on.

Holland was a great engineer. He typified the highest ideals of his profession. It is said that the morning after his graduation from Harvard with a degree in civil engineering in 1906, he started to work at tunnels. They held a peculiar fascination for him and almost immediately he recognized in them his life work. Miles of tunnels were built in the city of New York under his personal supervision. At the age of thirty-two he engineered \$25,000,000 worth of subway construction under the East River. Then came the opportunity for the New York-New Jersey Vehicular Tunnel, and Holland was chosen chief engineer for this project because he had the most comprehensive experience in subaqueous tunneling of any man around New York at the time, regardless of age.

He was a man of great power of concentration. In his devotion to his work he knew no office hours. It was his ambition to build tunnels and he achieved his ambition. His success proves that the engineering work of the world cannot be done in the eight-hour day. But this is tragedy—that a man should so brilliantly achieve and lose his life in doing so. It is heroism, too, for Holland followed his daily tasks knowing his span was limited. All branches of the engineering profession honor him as a master builder and a hero.

### Towne Bequeaths Large Amounts

BY THE will of Henry R. Towne, Past-President of The American Society of Mechanical Engineers, the endowment of the Engineering Foundation is increased by \$50,000. The new bequest establishes the Henry R. Towne Engineering Fund, the income from which is to be expended for the furtherance of research in science and engineering, or for the advancement in any other way of the profession of engineering and the good of mankind. Mr. Towne was for years a friend of Ambrose Swasey, the founder of Engineering Foundation, and like him a believer in the value of engineering research.

The bulk of Mr. Towne's estate, estimated at several millions, is given as a residuary bequest after the death of his son, John Henry Towne, to establish museums of peaceful arts, or industrial museums, for the people of the city of New York. He provided a fund of \$50,000 for a campaign to bring to public notice essential facts regarding the great industrial museums of Europe. The will urges the support of this movement by members of the Merchants' Association, of which he was a former president, and other interested citizens. It further asks that a committee be selected to go to Europe to obtain data regarding such institutions there.

Provision is also made in Mr. Towne's will for a trust fund of \$10,000 for the Franklin Institute at Philadelphia, which is established in memory of his father who was actively connected with the Institute.

### Engineers Honor Ferranti

THE four national engineering societies tendered a luncheon at the Yale Club, New York City, on November 6 to Dr. S. Z. de Ferranti, eminent British engineer and a pioneer in the field of electrical distribution. Greetings from the four Societies were extended through Calvert Townley, representing the A.I.E.E., Alex Dow, representing the A.S.C.E., J. V. W. Reynders, representing the A.I.M.E., and President Fred R. Low, representing the A.S.M.E. John W. Lieb presided.

Dr. de Ferranti responded to the greetings with reminiscences of his early experiences in the electrical field. He said that when he first became engaged in electrical work he was of the opinion that there was little left to be accomplished, but after more than forty years of experience he feels that the opportunity in this field at present is even greater than it was when he entered it. In his talk Dr. de Ferranti told of some of his experiences in developing an electric-supply system for London in 1886. His work on this system led to his developing workable transformers and to the introduction of paper-covered cables. There were practically no measuring instruments at that time and the voltage on the high-tension system was measured by means of lamps in series, the brightness indicating the comparative increase or decrease in voltage. Another problem which was met in this work was the adaptation of existing types of engines to take care of a variable electrical load.

### Personnel Research Federation

W. V. BINGHAM, of Carnegie Institute of Technology, has been appointed Director of Personnel Research Federation, which has its office in the Engineering Societies Building, 29 West 39th Street, New York City. The Federation was established in 1921, under the auspices of Engineering Foundation and National Research Council. It comprises more than twenty societies, research bureaus, and universities engaged in the scientific investigation of problems affecting workers and their work.

The activities of the Federation that interlock most closely with the interests of the engineering societies include, 1, the study of placement agencies and their efficient functioning in bringing men and jobs together; 2, the collection of information about opportunities and careers as an aid not only in placement but also in educational guidance, in high school, engineering school, and college; and 3, the investigation of effective methods and practices of industrial personnel administration.

The official publication of the Federation is the *Journal of Personnel Research*, which has recently contained contributions by engineers on such topics as engineering aptitudes, motion studies,

industrial accident prevention, and tests of railroad personnel, as well as articles by physicians, psychologists, economists and labor leaders on technical aspects of personnel matters. The coöperation of such a varied group of specialists is an outstanding feature of this organization established to promote research activities pertaining to personnel in industry, commerce, education, and government, wherever such researches are conducted, not in a partisan spirit or for propaganda, but in the spirit and in the methods of science.

The member organizations are widely distributed—in Philadelphia and Washington, Pittsburgh and Chicago, North Carolina, New Hampshire, Michigan, and Massachusetts.

The plans of the Personnel Research Federation for the coming year, as formulated by its board of governors, include certain studies to be carried forward by the central staff. Major investigations, as heretofore, will be made under the direct supervision of member organizations. The energies of the director and his assistants will be concentrated on the establishment of a clearing house for information about problems, researches in progress, sources of data, and methods of investigation. Existing research facilities and the most promising lines of inquiry will be inventoried to determine opportunities for progress. Much is to be accomplished through the discovery and collection of unpublished reports and notes of research on industrial fatigue and industrial hygiene, including mental hygiene; hiring, placing and training of workers; methods of wage payment; non-financial incentives and rewards; vacations with pay; personnel records and forms; methods of personnel administration, vocational guidance and placement in colleges and schools; selection and development of executives, and other live topics of personnel research on which data are often buried in the files of business concerns, trade associations, labor organizations, government bureaus, and university departments.

Assistance will be available for member organizations, manufacturers' associations, labor groups, and university departments wishing to be brought into touch with authorities on the several aspects of their personnel problems. Joint effort of many co-workers will speed the clear definition of puzzling questions about workers in relation to their jobs and opportunities, and point the way toward the solution of these questions by scientific, impartial, disinterested methods.

### Wood-Waste Prevention

THE phrase of the spendthrift, "Plenty more where it came from," cannot be longer used in speaking of the timber supply of the United States. During November the mountainsides of the country were hung with the smoke clouds of forest fires started by the carelessness of men in the parched woods. Forest fires are an obvious waste of precious lumber, but there are many other means of reducing the drain on our wood supply.

As this issue of MECHANICAL ENGINEERING goes to press, a National Conference on Utilization of Forest Products is being held in Washington at the call of Henry C. Wallace, late Secretary of Agriculture. A large representation of interested organizations and individuals was invited "to consider the unparalleled problem of maintaining a perpetual supply of forest products sufficient to meet the needs of the greatest wood-using nation in the world." Presumably, the conference will be successful in obtaining national recognition of the need for more economical utilization of forest products, which, with forest protection and wood growing, makes a problem that demands for its solution the coöperative intelligence and vision of the American people.

The Department of Agriculture issued a booklet with the call for this conference, and some of the staggering facts included therein are given here in brief as a stimulant to engineering attention and thought.

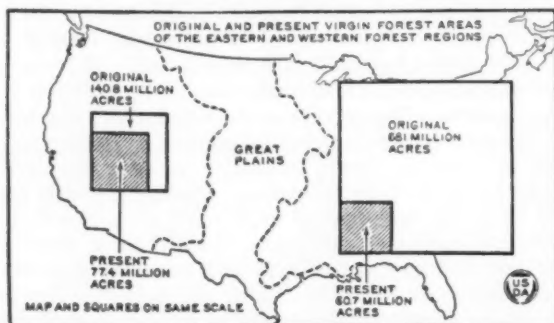

*I—Wood-Using Industries Facing Exhaustion of Raw Material.* Wood is the raw material for a group of American industries which ranks approximately third in value of output among all the groups supporting the Nation's economic life. Wood substitutes have multiplied, but no faster than wood uses. Wood shortage means a lowered standard of living and a tremendously costly scrapping of plants and readjustment of industries. To avert it is a national problem of the first magnitude.

*II—Present Timber Supply One-Third of Original Stand.* The present area of forest land in the United States is approximately 469,500,000 acres. This is about 57 per cent of the original forest area, but it has been largely

cut and burned over, so that it now bears less than one-third of the country's original forest stand. The proportions are about as follows:

	Acres
Virgin forest.....	138,100,000
Cut-over and burned-over forest:	
Second growth, saw-timber size.....	113,800,000
Second growth, cordwood size.....	136,400,000
Non-restocking.....	81,200,000
Total.....	469,500,000

The total supply of forest material is divided, for convenience, into saw timber and cordwood. Saw timber includes everything large enough to produce sawed stock, such as lumber, railroad ties, and dimension material, under the logging and milling practices current in the different regions,

ONLY A REMNANT OF THE ORIGINAL EASTERN FOREST REMAINS, AND NEARLY HALF OF THE VIRGIN FORESTS OF THE WEST HAVE GONE

THE STATES HAVING BLACK CIRCLES MUST HAUL IN WOOD TO MEET THEIR NEEDS. THE STATES NORTH AND EAST OF THE HEAVY LINE, IN OUR GREATEST INDUSTRIAL AND FOOD-PRODUCING REGION, MUST PAY A HEAVY FREIGHT BILL ON 75 PER CENT OF THE LUMBER THEY USE. A PRACTICAL AND IMMEDIATE MEANS OF REDUCING THIS FREIGHT BILL IS TO CUT THE MANUFACTURED PRODUCTS NEEDED FROM A SMALLER AMOUNT OF LUMBER, WHICH CAN BE DONE BY REDUCING WASTE

and also round stock such as poles, piling, and mine timbers. Cordwood includes all material too small for saw timber.

The total remaining stand of timber is estimated as follows:

	Billion cu. ft.
Saw timber.....	485
Cordwood.....	211
Total.....	746

III—Timber Shortage Will Become General in a Few Years. The present rate of cutting from our forests is about as follows:

	Billion cu. ft. per annum
Saw Timber.....	11.6
Cordwood.....	10.8
Total.....	22.4

In addition to this drain of 22.4 billion cubic feet, there is a waste in the forest itself, from fire, decay, insect attack, and windfall, of about 2.4 billion cubic feet.

It is obvious that if the present rate of drain were to continue unrelieved, and if there were no growth increment, the Nation's entire stand of timber would be wiped out in a comparatively few years—the saw timber in about 37½ years, and the cordwood in about 22 years.

The rate of drain is not likely to decrease; in fact, economic studies point to the conclusion that, although our per capita consumption of wood is declining, our wood requirements will increase from year to year with the increase in population.

The increment of wood through growth is six billion cubic feet a year. Although this growth is mostly on trees now in the cordwood class, it will have its effect in extending the supplies of both saw timber and cordwood, unless lost by fire or premature cutting.

Still the central fact is that we are using up our timber four times as fast as it grows.

IV—Better Utilization an Immediate Recourse. The object of a constructive forest policy is to supply enough timber and other forest products to

meet the Nation's needs. Only three lines of action are possible to meet the situation:

- Promoting forest growth
- Promoting forest protection, principally from fire
- Promoting less wasteful manufacture and use of forest products.

If present best practice and knowledge were put into effect to the fullest extent economically feasible, it is estimated that a saving of approximately two-ninths of the present drain on the forests could be accomplished.

V—A Survey of Utilization Losses—Where and How They Occur. Two-thirds of the entire drain on the forest is lost during manufacture and use. Where and how do the losses occur?

One of the largest single items of loss of forest products is decay. The total annual loss by decay during storage and in service is estimated to be the equivalent of over 4 billion cubic feet of standing timber—almost a fifth of the annual drain upon our forests.

In the logging of saw timber for lumber and other sawed products, almost 2.3 billion cubic feet of standing timber per annum is lost or wasted. Woods losses in saw timber manufactured into other than sawed products amount to about 1.2 billion cubic feet every year, and in material smaller than saw timber to almost 2 billion cubic feet per year.

The total of all the woods losses is about 5.5 billion cubic feet per year, or about 24 per cent of the forest drain.

About 55 per cent of the volume of the log as it enters the sawmill emerges as useful product. The remaining 45 per cent is lost in bark, saw kerf, slabs, edgings and trimmings, and culls due to mismanufacture.

The annual gross loss is thus over 2.8 billion cubic feet of standing timber. Since some of this waste is converted into lath, box shooks, and other small products, the net loss is appreciably less.

Mechanical defects such as checks and cracks, loosening of knots, warping, splitting, twisting, cupping, etc. are in general caused by the seasoning process and are usually termed "seasoning defects." They result in a reduction in the quality of the board or in the salable volume, or both. They may occur at almost any period during the manufacture and use of wood.

The sum total of the various seasoning losses represents over 1 billion cubic feet of standing timber per annum, or more than 4 per cent of the forest drain.

Wastes and losses in remanufacture are those which occur in the production of finished articles from lumber and dimension material. The total of all remanufacturing losses exceeds in amount the equivalent of 1½ billion cubic feet of standing timber annually.

A total annual loss of at least 1 billion cubic feet of standing timber is caused by waste occurring in a wide variety of forms, each comparatively small in amount, among them the following:

- Improper design of structures
- Unsuitable grading rules
- Failure to use short and odd lengths of lumber
- Destructive turpentine-orcharding methods
- Staining of sapwood
- Wasteful processes in the manufacture of chemical pulp.

VI—Eliminating Now Preventable Wastes Would Save Two-Ninths of the Present Drain on the Forests. Upon the basis of present wastes and losses, the present status of research in forest products, and present economic conditions, the Forest Service has made a detailed estimate of the savings which could be made in the drain on the forest if our best present knowledge were applied throughout all of the various steps in the manufacture and use of forest products wherever commercially and economically feasible.

The total of this estimate is 5½ billion cubic feet per year.

This amount is more than two-ninths of the present annual forest drain and nearly equals the total growth of timber over our entire forest area.

A total saving of about ¾ billion cubic feet of standing timber can be realized annually by cutting small dimension stock from woods and mill waste wherever now feasible.

VII—Ultimate Savings Can Double Those Now Feasible. What does the future hold in the way of still better methods? It seems probable that additional savings which may be expected in the future will be as great as those now feasible, in which event the ultimate possible savings would be 10 billion cubic feet per year, or four-ninths of the present drain.

VIII—What Can Be Done to Meet the Immediate Crisis? The following are suggestions as to the nature of the action required. There is no attempt at completeness in either subject matter or detail.

The first thing needful is a recognition by the forest-using industries of the fact that the perpetuation of their supply of raw materials and the permanence of the communities dependent on them demands the immediate adoption of all practicable known methods for preventing wood waste. In this connection it must be borne in mind that forest-using industries include not merely lumbermen and lumber mills, but all of the complex network of industries that depend upon wood.

Secondly, it seems necessary to disseminate, on a truly national scale, knowledge of the present best practice in wood utilization, so that nobody need use wasteful methods because he knows no other.

The third necessity is to iron out the obstacles, often needless and accidental, which separate each piece of wood from its highest possible use. The problem is largely one for industrial surveys, standardization of specifications, and mutual education of buyer and seller.

The fourth thing needful is research. Scientific investigation should forge ahead into the vast field for savings not yet economically feasible but often capable of becoming so with slight improvements in technique.

Fifth, the economic factors bearing on forest utilization should be thoroughly reviewed to see if there are any obstacles to better utilization in the form of transportation rates or rules, tax status, grouping of industries, or the like, which could logically be removed.

## Aviation from the Standpoint of the War Department<sup>1</sup>

THE "Round-the-World-Flight" was one of the most notable achievements of our time and one which all the world applauded. The endurance flight of 36 hours, the non-stop and dawn-to-dusk flights across the continent and other accomplishments of the Air Service were remarkable feats. The many records for speed, altitude, distance, and endurance which our aviators have won fill us with pride. But we must remember that two or three world cruisers and four or five racing machines capable of making 250 miles an hour do not make an air force. Today, while we hold a majority of the world's records in aviation, our actual relative strength is growing weaker each year. Our air force is far below the safety point for national defense. We lack a sufficient number of modern planes to train even our small peace force; we lack a sufficient number of trained fliers; we lack an airplane industry capable of supplying our needs in an emergency. Our pilots are flying, to a large extent, planes constructed several years ago, rebuilt and patched up to make them safe. Our actual shortage of planes is getting greater and greater every year. We do not want a large air force capable of aggressive action; but we must have a defensive force adequate for our security. This cannot conceivably be called militarism; it is just common sense.

These deficiencies, serious as they are of themselves, are even more serious when the time element is considered. We cannot train fliers without planes; we cannot build planes quickly without a going industry. Even with adequate manufacturing facilities, which we now lack, it would take six or eight months to supply our first army with planes; nine months to train sufficient fliers to man them. Before that time our troops would have to fight under a heavy handicap with a terrible loss of valuable lives; our large cities, industrial centers, and critical transportation points would be in danger of disastrous bombardment; indeed, the war might be lost before we had begun to fight. This is our present situation. It is up to us to see that it is corrected.

We should not enter into armament races with other nations. That is not the American policy. We need sufficient planes for training and the first shock of defense, sufficient pilots to man them, and an efficient airplane industry to supply our war-time needs. Beyond that we should not go; less than this would court disaster. The annual cost of this insurance would not be great. It would be about equal to twelve hours' expenditures during a war.

We Americans must decide whether we really want a reasonable preparedness for defense, or whether we will take a chance on the future with the certainty of paying heavily if we lose the gamble. If we want a reasonable preparedness, we must be willing to pay a reasonable amount for it. Our best and cheapest investment for the national defense is aviation.

The development of commercial aviation would be of great importance in the national defense. It would keep this vital industry alive, would give us a reserve of trained pilots, and would furnish planes readily convertible to war needs. Commercial aviation abroad is heavily subsidized by the various governments. Last year, England devoted 2½ millions of dollars to civil aviation and subsidies; France, 8½ millions; other nations large amounts. Commercial aviation assists not only in producing the latest types of planes and engines, but also makes possible the continuation of a struggling industry and a nucleus of production personnel and the perpetuation of airplanes design and construction which is so vital in time of need. Our public have not yet been educated to the many advantages of commercial aviation. Even the benefits of the Air Mail, which is making a wonderful record, are not generally appreciated. Whether commercial aviation can survive in this country without a subsidy, I do not know. I would like to see a company organized to carry valuable express matter, not passengers, between several of our large cities. Such a company might pay and pay well in the course of time. It would be a valuable factor in the national defense.

<sup>1</sup> Extracts from an address by Col. Dwight F. Davis, the Assistant Secretary of War, at the banquet of the International Air Meet, Dayton, Ohio, October 3, 1924.

World civilization should advance in direct ratio with the rate which separated communities are brought into contact with the knowledge, thought, and achievements of the world at large. Radio has annihilated distance and the airplane is bringing the far places of the world into ever closer contact. The marvelous inventions of modern science will inevitably bring out changes in every branch of human activity, industrial, social, as well as military, and particularly in the realm of international relationships. The airplane may be a great factor for good, but it also has vast potentialities for evil. Let us bend our every energy to the end that the development of the airplane may mean the advancement, not the destruction, of our civilization.

## Bureau of Mines Investigates Possible Hazards in Use of Ethyl Gasoline

IN CONNECTION with the unusual circumstances attending the death of certain individuals employed in the making of tetraethyl lead in the Bayway, N. J., laboratories of the Standard Oil Company of New Jersey, the Department of the Interior, through the Bureau of Mines, calls attention to the difference between tetraethyl lead and ethyl gasoline. These two products, which are quite different, would seem to have become confused in the minds of the public as the result of press accounts of this unusual occurrence. Considerable publicity has been given to the statement that the product causing the poisoning of these persons was ethyl gasoline, the product as sold to the automobile owner. This is erroneous, the Department points out, as the poisoning at the Bayway laboratories occurred in the process of the manufacture of the concentrated tetraethyl lead. This product is not sold to the automobile driver except when tremendously diluted with gasoline, and is not in itself an engine fuel.

One of the outstanding problems confronting the automotive engineer in attempting to construct motors of greater economy is that of eliminating the so-called "knock" from the operation of the engine. It has been demonstrated that this "knock" can be controlled by the addition of small quantities of certain fluids. These materials make it possible to use satisfactorily a lower grade of gasoline and to use engines of a more economical type. The value in fuel conservation, of both increasing the portion of crude oil marketable as motor fuel and also permitting the designing of more efficient engines has been obvious to the Bureau of Mines. The Bureau's attention was called to the possibility of health hazards involved in the use of motor gasoline so treated, in addition to the ever-present hazard of carbon monoxide from exhaust gases. As a result the investigation of the use of these products in motor gasoline was undertaken some months ago. The laboratory work was conducted at the Pittsburgh Experiment Station of the Bureau of Mines under the direct supervision of its technical staff.

One of the most commonly used anti-knock compounds is known as tetraethyl lead. This is added to gasoline in quantity of less than one part of tetraethyl lead in one thousand parts of gasoline by volume, and the resulting mixture is sold on the market as ethyl gasoline.

The danger in the manufacture and handling of the concentrated tetraethyl lead and the possible risk in handling the ethyl gasoline as sold to the automobile driver, are now being investigated, and as soon as sufficient data have been obtained to draw conclusions, the results will be made public.

The possible hazard due to the exhaust gases from automobiles using ethyl gasoline as ordinarily sold has been under investigation for more than ten months, during most of which time various types of animals have been exposed daily to a concentration of exhaust gas from an engine using ethyl gasoline in excess of that known to exist in ordinary traffic of a city street.

After a period of approximately eight months' daily exposure to the above conditions there was no indication of lead poisoning, and the investigation conducted indicates the seeming remoteness of any danger of undue lead accumulation in the streets through the discharging of scale from automobile motors.

The investigation of the possible hazards of lead poisoning from exhaust gases is being continued at the Pittsburgh Station of the Bureau of Mines, together with the first two phases of this study.

## Management Week a National Success

THE success of Management Week, held in October for the third consecutive year, was so definite and assured that the Joint Committee in charge of national arrangements has secured the approval of the five coöperating societies for the appointment of a permanent Joint Committee on Management Week, to consist of one member from each society. The new Committee will take up its duties on January 1, 1925, and immediately begin their plans for the Fourth Annual Management Week, to be held next October.

Great credit for the unusual interest aroused in the subject of Budgeting for Better Management this fall is due this year's Joint Committee, which consisted of C. R. Stevenson, Chairman, representing the National Association of Cost Accountants; Sterling H. Bunnell, representing The American Society of Mechanical Engineers; Henry Bruere, representing the American Management Association; W. H. Leffingwell, representing the Taylor Society; and E. M. Robinson, representing the Society of Industrial Engineers. In their efforts they received the coöperation of local joint committees in 65 cities in the United States and Canada, where from one to a half dozen meetings were held on management topics.

Any attempt to accurately measure the results of the intensive concentration on management problems during the third week in October must necessarily be incomplete at this time. Data and statistics were presented which offer opportunity for progress impossible until just such data were made available. The results, therefore, will be progressive and, to a large extent, immeasurable at the present time.

Of all the problems confronting management, that of Budgeting for Better Management was selected upon which to focus attention this year. The Dawes Plan of Reparations had attracted the attention of all civilized countries to the possibilities of the use of the budget; the problems of national and state budgets were being discussed in pre-election speeches. The time, therefore, was ripe for concentration of engineering and scientific minds on this subject. For, although the assets of budgeting in the spending of millions and billions are pretty generally acknowledged, its value in the small business, where thousands instead of millions of dollars are to be expended, is not so generally recognized. The meetings during Management Week aroused a scientific interest in budgeting for all business, large or small, and discussed not only the practical problems in the applications of budgets, but also their stabilizing effects on business when more broadly and intelligently applied.

Possibly nothing shows the status of the Management Week idea in the non-technical field better than the fact that Gov. A. V. Donahey of Ohio issued a formal statement calling attention particularly to meetings arranged at the College of Commerce and Journalism at Ohio State University, and urging their importance upon executives of industrial and other commercial organizations. "The central idea back of the observance of Management Week," said the Governor, "is more efficient management and the elimination of waste in business. This objective is most commendable and should attract the serious interest and support of the men who manage our business establishments." Ohio cities had conspicuous success with their programs. Dayton, Cincinnati, Columbus, Cleveland, and Toledo all held meetings. In Cincinnati the week's program was opened on October 21 at the forum of the Chamber of Commerce addressed by Thomas B. Fordham of Dayton, who is rated as a national authority on budgetary control. Mr. Fordham stressed the point that too little thought is given to working conditions and the contentment of individuals in industrial life, and that budgeting, to be most successful, must coördinate all the executive and administrative forces in industry with the human forces so that the results may be added profits to the business. At a meeting held later in the week, Dr. J. O. McKinsey, head of the department of accountancy of the University of Chicago, and the author of several books on budgeting, sketched the subject of budgetary control and told of its benefits in all lines of business. Dr. McKinsey gave illustrations of dead corporations which had been brought back to life through budgetary control and declared that

millions of dollars could be saved annually by the installation of proper budgeting systems.

In New England some of the meetings held were in Boston, Bridgeport, Hartford, New Britain, New Haven, Providence, Burlington, Worcester, Meriden, and Pittsfield. At Boston, Howard Coonley, president of the Walworth Manufacturing Company, told how budgeting had helped to smooth his production over the entire year and decrease his labor turnover. He stated that it was possible for him, in his business, to anticipate conditions six months in advance. At the same meeting Col. B. A. Franklin spoke of the benefits to be derived from comprehensive planning and budgeting, especially as related to advertising and sales expense. Other phases of budgeting were treated by Wm. S. Kemp, Dr. S. W. Stratton, and Dean Wallace B. Donham. Dean Donham summed up his talk by saying that to his mind the greatest value of an attempt at budgetary control came through the coöperation of the personnel of the business it secured. He stated that such a budgetary system, with the coöperation it secures, makes possible internal changes for economy with any company, in anticipation of times of poor business, with at least twice the rapidity obtained in diminishing expenses in an organization operating without a budgetary system.

In the Middle Atlantic States some of the meetings held were in Syracuse, New York City, Buffalo, Elmira, Philadelphia, Plainfield, Baltimore, Erie, Utica, Washington and Pittsburgh. In Buffalo daily meetings were held, numbering ten in all, which had the support of local organizations. The dinner meeting Friday evening was addressed by H. S. Person, managing director of the Taylor Society, on The Kind of Budgeting Required by Industrial Conditions. Dr. Person said in part: "There are five fundamental requisites for industrial budgets: a definite organization, a definite authority and responsibility assigned to each individual, a system of records which makes authority and responsibility effective, a forecasting of the future in terms of organization authority and responsibility, and a constant current appraisal of performance in terms of these forecasts." L. W. Wallace, Executive Secretary of the A.E.C., also attended and addressed this meeting. He described European industrial conditions as he saw them during extensive travels on the Continent last summer.

Meetings in the Southeast included those held in Knoxville, Atlanta, Birmingham, and Richmond. Knoxville was particularly interested in an address by John C. Borden, director of finance of the city of Knoxville, on Problems and Effectiveness of Budgeting in Municipal Administration Work. Knoxville with its city-manager form of government set a new record some months ago in paying a rebate on city taxes, and one of the effective factors in this accomplishment was budgeting. Other topics discussed were Budgeting as Applied to Small Manufacturers, and Budgeting as Applied to Railroads.

In the Central States numerous meetings were held, including four at Milwaukee with a total attendance of about a thousand people and some turned away for lack of room. Dean E. A. Fitzpatrick of Marquette University spoke at one of these meetings on Budgeting the Human Resources of Business. The Milwaukee Public Library furnished book lists on management subjects for distribution at the meetings. Other meetings in the Central States included those held at Minneapolis, St. Louis, Fort Wayne, and Chicago. Among the speakers in Chicago was C. G. Stoll, works manager at the Hawthorne plant of the Western Electric Company, who aptly said that "the essence of successful operation of any industrial establishment is contained in the maxim, 'Plan your work, then work your plan.'"

Pacific Coast meetings included those held at Los Angeles, Seattle, and Portland. At the latter city a half-dozen meetings were held by various organizations in the town, including the Business and Professional Women's Club. Los Angeles had five meetings and a number of radio talks.

In Canada, the Toronto Committee arranged for meetings in London, West Toronto, and Montreal, as well as for several in Toronto. This was the first time Management Week had been celebrated in Canada and it was a distinct success.

## Henry Robinson Towne

**H**ENRY ROBINSON TOWNE, eighth president of The American Society of Mechanical Engineers and honorary member of the Society since 1921, died at his home in New York City on October 15, 1924.

Mr. Towne came of old English stock, being the direct descendant in the ninth generation from William Towne, who emigrated from Yarmouth, England, in 1640, and who settled at Salem, Mass. His father, the late John Henry Towne, was well known and highly esteemed in the city of Philadelphia, Pa., where, as a member of the firm of Merrick & Towne and of the Port Richmond Iron Works of I. P. Morris, Towne & Co., he was connected with the design and construction of important engineering work, marine engines, sugar machinery and other heavy machines.

It was in Philadelphia that Henry Robinson Towne was born, on August 28, 1844, his mother being Maria R. (Tevis) Towne. The youth was educated at private schools and at the University of Pennsylvania, followed by a course at the Sorbonne, in Paris, after which his practical shop training was gained in the Port Richmond Iron Works, both in the shop and in the drafting room, leading on to work in charge of erection of machinery in the navy yards of Boston, Portsmouth, and Philadelphia, this experience covering the period between 1862-1865, when the establishment of which his father was an active member was engaged in construction work for the Civil War activities of the Navy Department, including some of the most notable designs of Capt. John Ericsson. During 1866-1867, Mr. Towne traveled and studied engineering in Europe, under the companionship of a notable American engineer, the late Robert Briggs; one of the fruits of that association being an important investigation upon the transmission of power by belting; of which the results appeared in a paper by Briggs and Towne in the *Journal of The Franklin Institute* in January, 1868.

About the time that Mr. Towne returned from Europe to Philadelphia there had come to that city from Shelburne Falls, Mass., Mr. Linus Yale, Jr., who had for years devoted himself to the invention and production of locks. Yale was seeking two things he lacked—capital and business management—and through personal acquaintances he had been brought in contact with Mr. John Henry Towne, who saw here the possibility of an association in which his son might well be entered. Henry R. Towne perceived at once what Yale had but imperfectly grasped; the possibilities of the small-key pin-tumbler lock as a manufacturing proposition upon what has since been called the quantity-production basis; and the result of the meeting was the formation in 1868 of what was at first called the Yale Lock Company, and which in 1883 became the Yale and Towne Manufacturing Company.

Yale had devoted much of his effort to the design of elaborate and individual locks for banks and vaults, and considered his ingenious pin-tumbler lock as a minor invention. Towne saw the real production advantage of this latter device, which lay in the fact that the tumbler mechanism, contained in a small cylinder separate from the bolt-work case and bulkier part of the lock, per-

mitted thousands of locks to be made by quantity-production methods all alike except for the tumbler cylinder, and that any cylinder set to any combination might then be added to any bolt case to make the completed lock. When to this segregation of the tumbler element from the bolt work was added the great advantage of the small flat key, there appeared an immediate opportunity for the conversion of the lock business from its former status as the personal trade of a locksmith into a commercial manufacturing proposition of almost unlimited possibilities.

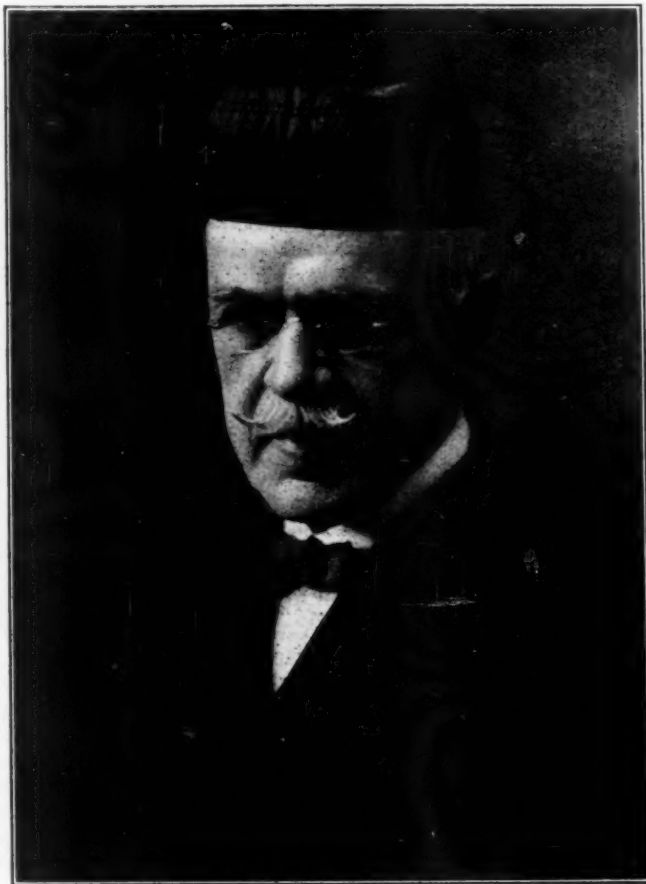

The almost unique combination of engineering ability and technical training with executive capacity and economic vision rendered Henry R. Towne the ideal associate for the dreamy inventor, Linus Yale. Stamford, Conn., within convenient reach of New York City, and possessing excellent transportation facilities by rail and water, was selected for the seat of the new enterprise, and there, fifty-six years ago, the small building was erected which became the nucleus of the great works of the present concern.

Hardly had the new enterprise been started when it received a stunning blow in the sudden death of Linus Yale, leaving Henry R. Towne at the age of twenty-four to carry the burden alone. From that date down to the year 1916, when he yielded the presidency to become chairman of the board of directors, the Yale and Towne Manufacturing Company was Henry R. Towne. As a great executive he naturally possessed the art of surrounding himself with able associates, but he was always the moving spirit, the presiding genius, and the inspiring director of that famous organization.

Mr. Towne became a member of The American Society of Mechanical Engineers in 1882, and almost immediately the in-

fluence of his presence became evident in its councils and in its development. In 1884-1886 he became vice-president of the Society, and as such he presided at the meetings of the year 1886 because the ill health of the president, Dr. Coleman Sellers, rendered the latter unable to attend. In 1889 he was elected president of the Society, a choice which enabled most valuable services to be rendered by him to the organization to which he was so keenly devoted.

It was during his incumbency that the first memorable trip of members of the four national engineering societies was made to England and France, in connection with the Universal Exposition held in Paris in 1889. As the ranking officer among the organizations then represented, Mr. Towne became the logical and welcome leader of the party, his executive ability appearing in the coherent organization effected on shipboard before the members landed in England; and those who had the rare privilege of working with him during that memorable summer have never forgotten the inspiration of his leadership. In England the professional, social, and official events called for the exercise of most tactful dignity; while in France there was required in addition a command of the language which can be appreciated only by those who recall his graceful and fluent response in French to the welcome extended at the reception tendered by M. Gustave Eiffel, as president of the

HENRY ROBINSON TOWNE

Société des Ingénieurs Civils de France, upon the occasion of the *dejeuner* given on the platform of the great tower on the Champ de Mars.

The outstanding feature of Mr. Towne's career lay in his broad extension of the scope of the work of the engineer to include the economics of engineering, and the essential union of production and management.

At the Chicago meeting of the Society, in May, 1886, Mr. Towne presented a paper entitled *The Engineer as an Economist*. So unusual was this topic that many of the members were inclined to regard it as a subject unsuited for presentation to an engineering audience, and it was with misgivings that the publication committee accepted it. Today, when "Scientific Management," "Efficiency," "Quantity Production," and their several extensions are regarded as essentials in engineering, the words of this epoch-making paper may appear somewhat trite, but when it is remembered that the following passages were written nearly forty years ago, the boldness which inspired them will be better appreciated:

"The organization of productive labor must be directed and controlled by persons having not only good executive ability and possessing the practical familiarity of a mechanic or engineer with the goods produced and the processes employed, but having also, and equally, a practical knowledge of how to observe, record, analyze, and compare the essential facts in relation to wages, supplies, expense accounts, and all else that enters into or affects the economy of production and the cost of the product."

"The matter of shop management is of equal importance with that of engineering."

Referring to conditions then existing, Mr. Towne said: "The management of works is unorganized, is almost without literature, has no organ or medium for the interchange of experience, and is without association or organization of any kind."

"The remedy must not be looked for from those who are 'business men,' or clerks or accountants only; it should come from those whose training and experience has given them an understanding of both sides (the mechanical and the clerical) of the important questions involved. *It should originate from engineers!*"

In 1889, at the Erie Meeting of the Society, Mr. Towne presented another paper upon the subject of gain sharing, and these two papers were the beginning of what is now recognized as the most important development in industrial engineering of the last fifty years.

Notwithstanding his intense work in the development of the great business of which he was the head, Mr. Towne found time to take part in many widely diversified activities. For five years he was the energetic president of the Merchants' Association of New York; he was most actively interested in the development of the Morris Plan Company of New York, and its president from 1914 to 1918, and chairman of the board until his death. The high responsibility of director in the Federal Reserve Bank of New York was held by him from 1914 to 1919; while among the other important directorships which Mr. Towne held may be mentioned those in the Industrial Finance Corporation, the American Dredging Company, and the Lincoln Safe Deposit Company. He was also treasurer of the National Tariff Commission Association.

In 1868 he married Cora E. White, of Philadelphia, by whom he had two sons, John Henry Towne, now secretary and treasurer of the Yale & Towne Manufacturing Company, and Frederick Tallmadge Towne, whose brilliant career as works manager of the great plant at Stamford was cut short by his lamented death in 1906. Mrs. Towne died in 1917.

Space will not permit the enumeration of Mr. Towne's many contributions to engineering literature, but mention must be made of his important memoir presented before The American Society of Mechanical Engineers in 1906, entitled *Our Weights and Measures and the Metric System*, in which he presented most forcibly the objections to the compulsory introduction of the metric system into American manufacturing industries, a position which he reiterated most emphatically in one of his latest utterances.

HENRY HARRISON SUPLEE.

New York.

## Bruno V. Nordberg

DR. BRUNO V. NORDBERG, for more than forty years closely associated with engineering progress and development in the power- and mining-machinery fields, died on October 30, 1924. Dr. Nordberg was born in Finland in 1857 and two years after his graduation in 1878 from the University of Helsingfors he came to this country, believing that it offered greater possibilities in his chosen field. Soon after his arrival he found employment with the E. P. Allis Company, where he had an opportunity to assist in the design of two large vertical blowing engines. The special designer who had been engaged for this work had tired of the conditions and left. Nordberg completed the job and one of these engines is still in use for blast-furnace blowing.

Early in his career he became interested in the improvement of design to effect greater economies. He recognized the possibilities of the poppet valve when used in connection with steam engines, also the opportunity of improving the efficiency of the slide-valve steam engine, provided a better control of steam admission could be obtained. He designed a poppet-valve governor for engines of this type which permitted an economy that was considered impossible at that time. It later became an absolute necessity, in order to utilize the high steam pressures and superheats of modern steam practice. It is the type of valve used today on the Nordberg uniflow engine.

BRUNO V. NORDBERG

In 1886 the Bruno V. Nordberg Company was organized to engage in the manufacture of governors. The business grew by leaps and bounds, and in 1890 moved to larger quarters and changed its name to the Nordberg Manufacturing Company. Dr. Nordberg followed his natural inclinations and began the design of a line of machinery. The development of the copper country of northern Michigan soon created a demand for power and mining equipment. This was the field for which he was particularly adapted and the result was an increased line of products including steam hoists, engines, compressors, condensers, etc. In 1900 the present plant was built to meet the increasing demands of the business. It covers about 42 acres. Dr. Nordberg recognized the value of a permanent organization and most of the department heads had been in his employ for from 20 to 25 years at the time of his death.

Among the achievements which brought Dr. Nordberg recognition among engineers in this country and in Europe are included the large hoists and compressors for metal-mine service. In 1897 he designed the famous hoist for the Tamarack Mining Company. An unusual design followed in the compound-condensing reel hoist built for the Homestead Mining Company. His greatest achievement in this direction, however, was the building of the mammoth hoist for the Quincy Mining Company at Hancock, Michigan, which exceeds in size any ever attempted and perhaps will be the world's largest for years to come. In addition to the above mentioned steam hoists he designed many unusual hoists for air and electric operation. Some of the largest air compressors and Diesel engines in service in this country reflect his designing skill.

Dr. Nordberg joined the A.S.M.E. in 1893, and was a member of many engineering and scientific societies. The degree of Doctor of Engineering was conferred upon him in 1923 by the University of Michigan in recognition of his skill in the design of special machinery which was a vital factor in the copper development of the state.

# Library Notes and Book Reviews

**THE Library** is a cooperative activity of the A.S.C.E., the A.I.M.E., the A.S.M.E. and the A.I.E.E. It is administered by the United Engineering Society as a public reference library of engineering and the allied sciences. It contains 150,000 volumes and pamphlets and receives currently most of the important periodicals in its field. It is housed in the Engineering Societies Building, 29 West 39th St., New York, N. Y. In order to place its resources at the disposal of those unable to visit it in person, the Library is prepared to furnish lists of references to engineering subjects, copies of translations of articles, and similar assistance. Charges sufficient to cover the cost of this work are made.

The Library maintains a collection of modern technical books which may be rented by members residing in North America. A rental of five cents a day, plus transportation, is charged. In asking for information, letters should be made as definite as possible, so that the investigator may understand clearly what is desired.

## A Handbook on Management

**MANAGEMENT'S HANDBOOK.** By a group of specialists and L. P. Alford, Editor in Chief. The Ronald Press Company, New York, 1924. Flexible binding, 5 X 7½ in., xxxii + 1607 pp. Illus., diagrams, tables. \$7.50.

**THIS** book offers in one reference volume a great quantity of well-selected material in the form of tables, charts, forms, and text relating to the many problems of industrial organization and management.

The subject-matter dealt with is divided into 32 sections, each of which is contributed by a specialist on the subject. The first section, devoted to tables of weights and measures and to industrial statistics compiled from the Census of Manufactures, contains many convenient tabulations not ordinarily available which are frequently of use. The second section, dealing with mathematics, is a well-selected arrangement of rules and principles underlying the many calculations of factory accounting, chart making, and graphic presentation. The subjects dealt with in the remaining chapters are plant layout and maintenance, purchasing, storekeeping, production control, time study and rate setting, wage payment, tariff and shipping, economic principles, cost accounting, budgetary control, insurance, banking relations, industrial relations, marketing, and related subjects.

The text is illustrated by many examples from the practice of representative companies. The subject-matter is conveniently arranged and indexed so that particulars relating to any problem under review, and with which the book deals, may easily be located.

The printing is well done and the illustrations and charts are clear cut. The book is, as it is intended to be, a handbook of proven practices in the organization and management of factories.

Quite naturally, since the machine shop was the first to respond to scientific-management principles, many of the problems presented refer to this class of shop, although not exclusively.

Managers and executive employees of all kinds of factories will find in this book much material of useful reference. It will also be found useful in college classes in industrial engineering.

The book is well balanced in the selection of material and allotment of space.

WALTER RAUTENSTRAUCH.<sup>1</sup>

**EVERY** science follows the same course in its development, viz., an experimental period during which a vast amount of apparently unrelated data is gathered, a period during which these data are studied and codified, a period in which the laws discovered during the codification are formulated, and finally the period in which the literature of the science begins to take definite form. The science of management has followed this course, and although it is barely twenty years since the first presentation of the possibility of management as a science, the last period has been reached, and already has made a definite impress on the trend of its development. The preparation of handbooks relating to a science marks its final development, for until it has taken definite form and its principles are firmly established, handbooks that translate its principles into practice and show its application to the arts are impossible.

The book under review represents the first attempt to furnish

a handbook of the science of management. It offers an answer to the question, "What is management?" and to those who have not kept in close touch with the developments of managerial science in the last ten years the answer will be a surprising one. The science of management began in the experiments of Taylor to find the answer to the question, "How much work should a man do in a day?" At first regarded as a purely local question relating to the machine shop, it was soon discovered that the principles that had found successful application in the machine shop were of almost universal application in every field of human endeavor. Management has been found to comprise the four great divisions of finance, purchase, production, and sales or distribution. Every industry comprises two or more of these divisions, and most industries comprise all. Management's Handbook is an attempt to present in concise form the essential principles and the best practice of these divisions, in all of their ramifications, in such form as to make them useful to the manager, the executive, and the engineer.

In the 32 sections into which the book is divided, the four divisions of management are broken down into a large number of subdivisions, all of which come before the executive at one time or another. The treatment of some of these subdivisions represents the best that has appeared on that particular subject up to the present time. In this class may be mentioned the sections on operation study and rate setting, and on wage payments. For the first time a comprehensive survey of all the diverse methods of attacking these difficult problems is presented, and the manager is given all the data necessary for the solution of his particular case. The section on production control is a veritable mine of information, from which the engineer can obtain much assistance in developing a control in any industry. The section on purchasing and storekeeping outlines the practice of the largest purchasing organization in the world, yet the matter is presented in such form that the smallest manufacturer can make use of it.

It is impracticable in the space of a brief review to point out and comment on all the valuable features of the book. Nevertheless, mention should be made of some of its outstanding features. From the standpoint of finance there are sections on budgetary control, cost accounting, and banking relations. Here the financial executive will find in condensed form all the information he needs, supplemented with references to other literature, if he finds it necessary to pursue the subject further.

In addition to the sections already mentioned as relating to production, there are sections which give the owner or executive the facts that are needed in the planning of the industrial plant, in the selection of its site, its layout, construction, maintenance, etc., in the provision of material-handling equipment, and in the storage of tools and material. Very little that is necessary, from the executive standpoint, has been omitted from these sections. As regards distribution and sales, the sections on market analysis, traffic and shipping, and packing for shipment will afford the sales executive much food for thought.

Several sections appear in the book that are distinctly new departures in the field of management literature. Among these may be mentioned the sections on charts and on conserving and salvaging. The former not only lists the charts that are in use in management—this is the usual treatment of the subject—but also compares the different types and points out the situations

<sup>1</sup> Prof. Indus. Engr., Columbia Univ., New York, N. Y. Mem. A.S.M.E.

in which one is better than the other. The direction for making and using them are especially complete. The section on salvage should prove to be especially useful to those managers that are in doubt as to the disposition of the waste of their plants.

ROBERT THURSTON KENT.<sup>1</sup>

### More Book Service

FROM time to time some member of the Society has occasion to consult a rather rare book or a foreign periodical that is not owned by many libraries. In most cases the need can be met by photoprinting the desired article, but there are cases where the length of the memoir makes this too expensive to be practical.

A new ruling by the Library Board will provide for many of these cases. It authorizes loans from the Engineering Societies Library of unusual reference works to public and college libraries, when needed by members of the Founder Societies, under the rules for inter-library loans of the American Library Association.

Application for these loans should come from a library, not an individual. Loans will be made for a limited period and the borrowing library must assume the responsibility for the safe return of the book and the expenses.

The new policy makes the Library more available to members engaged in exhaustive research, and to those in need of treatises in foreign languages. It supplements the popular lending service that was inaugurated last winter to supply modern treatises, and fills a gap that photoprinting has not covered in the reference use of the collection.

The Library can now send the member at a distance an ordinary current text from its lending collection. It can send a reference book, if it is not available in his region or is not in too constant use to be spared. It can photoprint anything it has for him. It has provided the distant member with all the opportunities available to those in New York, so far as it is humanly possible.

### Books Received in the Library

ATMOSPHERISCHE STÖRUNGEN IN DER DRAHTLOSEN NACHRICHTENÜBERMITTLUNG. By A. Koerts. M. Krayn, Berlin, 1924. (Die hochfrequenztechnik in einzeldarstellungen, bd. 1.) Paper, 7 × 10 in., 151 pp., diagrams, tables, 10 × 7 in., paper. 10 mk.

An investigation of the atmospheric disturbances that affect radio communication and of the extent to which they may be overcome, particularly by methods which diminish their power in proportion to the signal waves emanating from the station. The freedom from disturbances of the various systems of sending now in use is examined, with special attention to the factors that determine freedom from interference. The study is a theoretical one, but was undertaken from the viewpoint of the practical radio engineer and is confined to those questions which appear important in practical application.

AUTOMOBILE GASOLINE, ITS DANGERS AND TESTS. By Augustus H. Gill. Lippincott, Philadelphia [c1923]. Cloth, 5 × 8 in., 57 pp., tables, diagrams, \$1.50.

Discusses the manufacture of gasoline, its selection, "improvers" and anti-knock compounds, fires and explosions, and gasoline substitutes. Methods of testing are given, with advice on the interpretation of tests. The book is intended to inform the automobilist about the properties, peculiarities and dangers of gasoline and to tell the chemist how to use and interpret the tests.

DIE BISHERIGEN AUSSCHLÜSSE STEIFER FACHWERKSTÄBE UND IHRE VERBESSERUNG. By Albert Dörnen. Ernst, Berlin, 1924. Paper, 6 × 9 in., illus., diagrams, \$0.75.

Presents the results of investigations of riveted joints in structural steelwork, carried out during the years 1920 to 1923. The tests are described in detail and the comparative efficiency of the various usual methods of making riveted joints is shown, together with improved methods devised by the author.

EISENHÜTTENKUNDE, Part I, Das Roheisen. By M. von Schwarz. De Gruyter, Berlin, 1924. Cloth, 4 × 6 in., 128 pp., illus., tables, diagrams, 1.25 gold marks.

<sup>1</sup> Supt. Prison Industries of State of New York. Mem. A.S.M.E.

A remarkable condensed description of the metallurgy of pig-iron. Opening with a historical and economic survey of the iron industry, the author rapidly considers the properties of the various commercial grades of iron, iron ores, fluxes and slags, blast-furnace fuels, the blast-furnace process, mixers, electric and direct processes, cupolas and air furnaces, and welding processes. A list of important books is included.

ELASTICITY AND STRENGTH. Section 5: Economic Theory of Steel Railroad Bridge Design. By C. A. P. Turner. Published by the author, Minneapolis, Minn., 1924. Cloth, 6 × 9 in., 129 pp., illus., diagrams. \$5.

The increase in the weight of railroad rolling stock during the past thirty years has been accompanied, Mr. Turner says, by no improvement in the triangulation of the truss frame to support this increased loading, nor has there been, until now, any theoretical investigation of the number and form of triangular frames which should be combined in a truss to secure maximum stiffness and minimum weight. In the present work these points are discussed and a theory of design presented which indicates considerable savings in weight, with a resulting reduction in cost of material, fabrication, and erection. An appendix contains a general specification for railroad bridges.

ELECTRIC RAILWAY HANDBOOK. By Albert S. Richey. Second edition. McGraw-Hill Book Co., New York, 1924. Fabrikoid, 4 × 7 in., 798 pp., diagrams. \$4.

This book brings together in convenient compass, data on subjects that are constantly coming up for consideration by operating, constructing, and designing engineers in everyday practice. Roadbed, track, car houses, shops, train movement, motors, controlling apparatus, current collectors, trucks, braking, cars, transmission, distribution, signals and communication are considered, the essential information being given without attempting to cover in detail all the ramifications of electric-railway engineering into other branches of the profession. The non-technical manager and operator, as well as the engineer, should find the book useful.

This edition has been revised and partially rewritten to include the many changes in practice that have occurred since the original publication of the book.

ELEMENTS OF COST ACCOUNTING. By Anthony B. Manning. McGraw-Hill Book Co., New York, 1924. Cloth, 5 × 8 in., 166 pp., charts. \$2.

A textbook intended to supply a simple, yet complete, presentation of the fundamental principles of cost accounting and its connection with the general accounting procedure. This is done by means of graphic charts with explanatory text and by a series of connected problems which are fairly representative of the practical work in the cost department of a factory.

ELEMENTS OF FORESTRY. By Franklin Moon and N. C. Brown. Second edition. John Wiley & Sons, New York, 1924. Cloth, 5 × 8 in., 409 pp., illus., tables. \$3.50.

The authors have produced a text that is general in scope and presents the subject in a form easily grasped by the average college student. Among the subjects discussed are the importance of forestry, methods of reproduction and forest management, forest protection, lumbering, the utilization and technology of wood, economics and the regional forests of America. Brief lists of references are given for various chapters.

FOREST MENSURATION. By Herman H. Chapman. Second edition. John Wiley & Sons, New York, 1924. Cloth, 6 × 9 in., 557 pp., diagrams, tables. \$5.

A thorough discussion of the measurement of the volume of felled timber and of the growth of trees; intended for those engaged in the purchase or exchange of forest property, the valuation of damages, the planning of logging operations, and the management of forest lands.

A LABORATORY MANUAL OF MACHINE-SHOP PRACTICE. By Jerry H. Service and George E. Freese. D. Van Nostrand Co., New York, 1924. Cloth, 5 × 8, illus., diagrams, \$1.25.

Intended to assist the practical machinist without teaching experience to organize and conduct a vocational course in machine-shop practice. It presents a distinct course that can be followed

in the shop and is used as a guide for the preparation of lectures. The course is intended for students who wish to become working machinists.

**MACHINERY'S HANDBOOK, FOR MACHINE SHOP AND DRAFTING ROOM.** Sixth Edition. Industrial Press, New York, 1924. Leather, 5 × 7 in., tables, diagrams, \$6.

Although called the sixth edition, this is the first to have been thoroughly revised and enlarged, so that it is markedly changed from the original issue. New material has been added to the extent of 230 pages, 97 tables, and 77 illustrations; other text and tables have been revised and many minor changes made throughout. The book is a most useful collection of the data needed by engineers, skilled workmen, and others engaged in the machine-building industries.

**MARINE STRUCTURES, THEIR DETERIORATION AND PRESERVATION; Report of the Committee on Marine Piling Investigations of the Division of Engineering and Industrial Research of the National Research Council.** By William G. Atwood and A. A. Johnson. National Research Council, Washington, D. C., 1924. Cloth, 6 × 9 in., 534 pp., illus., maps, tables. \$10.

In 1914 shipworms appeared in the northeastern portion of San Francisco Bay, a region previously free from them, and by 1920 practically every timber structure in these waters had been destroyed. A local committee was formed to seek protective measures, but as the magnitude and national importance of the problem grew apparent, the National Research Council was asked to make a national study of the preservation of wooden structures from borers and an investigation of the value and use of substitutes for timber.

The report presents the results of the investigations and forms a convenient presentation of our knowledge of marine borers, of methods for protecting marine structures from them, and of the stability of concrete and metal when exposed to sea water. Reports on the activities of borers are given for all important American harbors. There are extensive bibliographies on marine borers, the preservation of wood, cement and concrete in sea water, and metal in sea water.

**MEHRSTIELIGE RAHMEN.** By A. Kleinlogel. Ernst, Berlin, 1924. Paper, 6 × 9 in., diagrams, 33.60 Swiss francs, or about \$6.25.

A labor-saving handbook for the structural designer. Its sixteen chapters contain a comprehensive collection of statically indeterminate systems that occur frequently in structural work, beginning with simple unsymmetrical members with one support and extending to complicated roof and floor trusses. The most frequently used formulas for the influence lines and for the shearing stresses are given for each case under various load conditions. The book should save much time in calculation.

**MOTOR TRUCKS; APPLIED MECHANICS FOR OWNERS AND DRIVERS.** By Edward E. La Schum. U. P. C. Book Co., New York, 1924. Cloth, 6 × 9 in., 325 pp., illus. \$4.

A reference book for truck operators by the general superintendent of motor-vehicle equipment for the American Railway Express. Describes in detail the various forms and types of trucks, explains their merits and demerits, and gives advice on their maintenance. A chapter on performance and maintenance records is included.

**NITROGLYCERIN UND NITROGLYCERINSPRENGSTOFFE (Dynamite).** By Phokion Naoum. Julius Springer, Berlin, 1924. Cloth, 6 × 9 in., 416 pp., illus., diagrams, tables. \$4.

A comprehensive treatise on this important group of explosives, which includes both an account of the most modern technical methods of manufacture and also of scientific research upon the questions that relate to nitroglycerin and the nitroglycerin explosive.

The first section, on nitroglycerin, describes its manufacture, its physical and chemical properties and its character as an explosive. The second section is devoted to the lower nitrates of glycerin and to esters homologous to nitroglycerin, which have theoretical or practical interest to students of explosives. In the third section the manufacture of dynamite, blasting gelatin and the other nitroglycerin explosives is considered. The author, who is director of the research laboratory of the Nobel factory in Hamburg, has had long practical experience in the industry.

**PROTECTION OF STEAM TURBINE DISK WHEELS FROM AXIAL VIBRATION.** By Wilfred Campbell. General Electric Co., Schenectady, 1924. Cloth, 8 × 10 in., illus., diagrams, \$1.

This work describes the main features of an extensive investigation of the various forms of vibration and waves which may exist in turbine disk wheels, carried out by the General Electric Co. The investigation resulted in the determinations of methods for designing and testing which insure freedom from axial vibration. The book was presented as a paper before The American Society of Mechanical Engineers in 1924.

**RAILWAY TRANSPORTATION, PRINCIPLES AND POINT OF VIEW.** By Sidney L. Miller. A. W. Shaw Co., Chicago, 1924. Cloth, 6 × 8 in., maps, tables, diagrams, \$4.

A discussion of the railroad "problem" from the point of view of the public, written for those who wish a better understanding of it, as a basis for its solution.

After a discussion of the relation of transportation costs to social and trade development, the author sets forth the growth of our railroad system and shows the existing grouping of railroads by ownership as well as by territory. The economics of operation and the problems pressing for solution are discussed. The author takes up the conception of the railroad as a competitive enterprise, points out the growth of coöperation, analyzes capitalization and explains the different bases for determining the true worth of railroads. The question of rate making is presented, and consideration is given to government regulation.

**RELATIVITY FOR PHYSICS STUDENTS.** By G. B. Jeffery. E. P. Dutton & Co., New York, 1924. Cloth, 5 × 8 in., 151 pp. \$2.40.

The series of lectures here collected were delivered to students of physics at King's College, London. They are intended to introduce the Einstein theory to students of science who are able to make some use of mathematics as an instrument of thought but who may not be ready to face the mathematical analysis which is essential for the thorough exploration of the subject in all its ramifications.

**STEAM AND OTHER USEFUL TABLES FOR ENGINEERS AND STEAM USERS.** By P. W. McGuire. E. & F. N. Spon, London, 1924. Cloth, 2 × 3 in., tables, 2 shillings.

Mr. McGuire has selected the data most frequently needed by boiler designers, stationary and marine engineers and other data concerned in the generation of steam, and publishes them in a minute volume that slips easily in the vest pocket. His steam tables are based on Professor Callendar's results.

**WATERPROOFING TEXTILE FABRICS.** By Herbert P. Pearson. Chemical Catalog Co., New York, 1924. Cloth, 6 × 9 in., illus., tables, diagrams, \$3.

Presents the principles underlying the processes for rendering cloth waterproof or water-resistant, and describes those which have been used on a large scale in the United States and Europe. Methods for testing the process are given, and there is a list of the processes and formulas patented in the United States, Great Britain, France and Germany since the year 1900. The book is a useful addition to the meager literature on the subject, written for users rather than manufacturers, but of value to both.

**WIRELESS POSSIBILITIES.** By A. M. Low. E. P. Dutton & Co., New York, 1924. Cloth, 5 × 6 in., diagrams, \$1.

Calls attention to some of the things that wireless cannot do today but which may become possible hereafter.

**WÄRME UND WÄRMEWIRTSCHAFT DER KRAFT- UND FEUERUNGSANLAGEN IN DER INDUSTRIE.** By Wilhelm Tafel. R. Oldenbourg, München und Berlin, 1924. Paper, 7 × 10 in., 363 pp., diagrams, tables. \$9.50.

Prepared with the needs in mind of students in technical colleges who expect to become operating engineers, factory chemists, etc., and thus to be interested in the generation of power and in industrial heating but not with questions of design. The book brings together the information on methods of heat utilization for power and heating which is necessary for the proper selection and operation of prime movers and furnaces and for meeting the thermal needs of the factory as a whole. In the concluding section of the book the general principles are applied specifically to the problems of the iron and steel works and the paper mill.

## LAST-MINUTE ADDITIONS TO

## THE ENGINEERING INDEX

Registered United States, Great Britain and Canada

*Exigencies of publication make it necessary to put the main body of The Engineering Index (p. 171-El of the advertising section) into type considerably in advance of the date of issue of "Mechanical Engineering." To bring this service more nearly up to date is the purpose of this supplementary page of items covering the more important articles appearing in journals received up to the third day prior to going to press.*

## AIR COMPRESSORS

**Five-Stage.** Five-Stage Air Compressor. Engineering, vol. 118, no. 3066, Oct. 3, 1924, pp. 498-499, 4 figs. Designed by Belliss & Morcom for supplying high-pressure air for coal-mine locomotives used for underground haulage.

## AIRPLANES

**Light, Use as Models.** Use of the Light Planes in Aeronautical Research. W. L. Lepage. Aviation, vol. 17, no. 16, Oct. 20, 1924, pp. 1169-1170. Notes on obtaining experimental data; flight tests of scale models; question of weight.

## ALLOYS

**Light.** Light Alloys. J. B. Swan. Automobile Engr., vol. 14, no. 194, Oct. 1924, pp. 293-300, 9 figs. General survey of modern practice; parts of automobile suitable for light-alloy castings; magnesium alloys; casting alloys suitable for stock loading; piston alloys; alloys suitable for forging purposes; duralumin; magnalite; aluminum as bearing metal; light alloys and hardness; Air Board, U. S. Navy and other alloys.

## AUTOMOBILE ENGINES

**Anti-Detonator for.** Tetra-Ethyl Lead as an Anti-Detonator in High-Compression Engines. H. K. Thomas. Automobile Engr., vol. 14, no. 194, Oct. 1924, pp. 308-311, 9 figs. Results of author's experiments.

## AUTOMOBILE MANUFACTURING PLANTS

**Machine-Shop Economies.** Possible Economies in Automotive Machine-Shop Operations. A. L. De Leeuw. Soc. Automotive Engrs.—Jl., vol. 15, no. 5, Nov. 1924, pp. 418-425. Indicates by examples certain important economies that might be introduced in shops, especially those which can be effected without much capital outlay; discusses auxiliaries and one definite operation, drilling, has been chosen as chief example. See also Am. Mach., vol. 61, nos. 19 and 20, Nov. 6 and 13, 1924, pp. 735-738 and 765-770.

## AUTOMOBILES

**Maybach.** German-Built Automobile Operates Without Shifting Gears. B. R. Dierfeld. Automotive Industries, vol. 51, no. 19, Nov. 6, 1924, pp. 810-815, 14 figs. Maybach car uses planetary low-speed gear only under extremely difficult road conditions; electric starter normally starts car on direct drive; engine and carburetor possess original features.

## BONUS SYSTEMS

**Tool-Room Application.** Bonus System Applied to Tool Department. Iron Age, vol. 114, no. 19, Nov. 6, 1924, p. 1219. Bonus system for tool-room use; making of dies expedited with resultant lower cost.

## CASTING

**Copper.** Making Copper Castings from Cupola Melted Metal. T. F. Jennings. Foundry Trade Jl., vol. 30, no. 427, Oct. 23, 1924, pp. 346-347, 1 fig. Common causes of defects in copper castings; need for deoxidizers; furnace factors; use of cupola in melting copper; cupola preparation; phosphor copper as deoxidizer; hardening copper; pouring heavy castings. Paper read before Am. Foundrymen's Assn.

## CENTRAL STATIONS

**Fort Dodge, Ia.** New Plant at Fort Dodge Shows High Economy. Power, vol. 60, no. 18, Oct. 28, 1924, pp. 676-681, 10 figs. Plant of 5000-kw. cap. using steam 550 deg. Fahr., shows boiler-room economy of 85 per cent; equipped with economizers, two-effect evaporator system with bleeding from main units, underfeed stokers, two induced-draft fans per boiler and motor drive for auxiliaries; simple coal-handling installation. Summary of equipment.

**Superpower.** Five New Superpower Steam Stations. Elec. World, vol. 84, no. 84, no. 16, Oct. 18, 1924, pp. 834-838, 5 figs. Turbo-generators totaling 465,080 kw. in 13 units being installed at Toronto (O.), Chicago, Long Beach, Kearny, and Peoria; ultimate rating of plants to be 1,392,000 kw.

## CYLINDERS

**Locomotive, Machining.** How the American Locomotive Company Machines Cylinders and Bushings. L. C. Morrow. Am. Mach., vol. 61, no. 18, Oct. 30, 1924, pp. 675-679, 15 figs. Laying out cylinders for boring and planing; machining operations; testing hydraulically; setting up and assembling cylinders; operations on cylinder and valve-chamber bushings.

## DIESEL ENGINES

**Double-Acting.** The Worthington 2-Cycle Double-Acting Diesel Engine. Engineering, vol. 118, no. 3066, Oct. 3, 1924, pp. 482-486, 10 figs. Describes types constructed by Worthington Pump & Machy. Corp. of Buffalo, N. Y.

## ELECTRIC LOCOMOTIVES

**Direct-Current.** Electrical Engineering Exhibits—

The British Empire Exhibition. Engineer, vol. 138, no. 3588, Oct. 3, 1924, pp. 370-374, 17 figs. partly on p. 382. Describes d.c. locomotives exhibited by Metropolitan-Vickers Elec. Co., and controlling equipment for 1500-hp. 3300-volt a.c. winder exhibited by Allen West & Co.; other exhibits.

## FLOW OF LIQUIDS

**Liquid Meters.** The Bassler Liquid Meter. Engineering, vol. 118, no. 3066, Oct. 3, 1924, pp. 497-498, 4 figs. Instrument is guaranteed to give measurements with error of less than 0.1 per cent over temperature range of 150 deg. Fahr., and irrespective of changes in viscosity of fluid or of pulsations and irregularities in rate of flow.

## FOUNDRIES

**Departmental Costs.** Departmental Costs in the Foundry. H. B. May. Foundry Trade Jl., vol. 30, no. 426, Oct. 16, 1924, pp. 333-335. With departmental costs profitable and non-profitable lines are clearly recognized, thus enabling sales department to choose line for their greatest effort; source of cost data; divisions of foundry costs; melting and annealing costs; cleaning and finishing costs, etc. Paper read before Am. Foundrymen's Assn.

## GEARS

**Design Chart.** A Design Chart for Industrial Gears. T. F. Stacey. Am. Mach., vol. 61, no. 17, Oct. 23, 1924, pp. 643-644, 1 fig. Presents chart which permits selection of proper gear without any mathematical calculations.

## GRINDING MACHINES

**Plunge-Cut.** Plunge-Cut Grinder. Iron Age, vol. 114, no. 19, Nov. 6, 1924, p. 1199, 2 figs. Wide-wheel, in-feed machine with reciprocating spindle adapted to production work; placed on market by Cincinnati Grinder Co. See also Machy. (N. Y.), vol. 31, no. 3, Nov. 1924, pp. 229-230, 3 figs.

## INDUSTRIAL MANAGEMENT

**Cost Control.** Statistical Summary and Abstract. Indus. Mgt. (N. Y.), vol. 68, no. 4, Oct. 1924, pp. 198-220. Details of practice in cost organization and in executive utilization of cost data obtained from 160 American industrial concerns employing aggregate of 500,000; tabular summary of cost-control practice in 160 plants (on supp. table); relation of timekeeping to cost work in 64 plants; relation of rate setting to cost; relation of cost department to control of materials; procedure with respect to compilation and distribution of overhead; how 67 concerns use cost data to prevent excessive costs; how foremen are brought in touch with cost and expense records, steps taken in 65 plants to reduce material investment; how 30 concerns handle idle facilities; steps taken to analyze and reduce shrinkage of materials; how cost analysis dictates programs of economies; use of employees' suggestion plan and its relation to costs; outstanding ways in which 78 industrial concerns use cost data for executive control. Points embraced in questionnaire which forms basis for summarized data, p. 197.

**Routing.** Perspective Routing. P. K. Guillow. Indus. Mgt. (N. Y.), vol. 68, no. 4, Oct. 1924, pp. 242-243, 4 figs. Time-saving suggestion for intelligent routing of production.

**Plant-Maintenance Work.** Organizing for Plant Maintenance Work. L. A. Blackburn. Soc. Automotive Engrs.—Jl., vol. 15, no. 5, Nov. 1924, pp. 440-444 and 448, 6 figs. Outlines plan of organization for large manufacturing plant; various departments of such organization, including policing of plant, protection against fire, maintaining plant in sanitary condition, removal of waste material, operation of power plant, inspection and repairing motors and metering devices, etc.

## INTERFEROMETERS

**Calibrating Standards of Length.** Interferometers for Calibrating Standards of Length. Engineering, vol. 118, no. 3066, Oct. 3, 1924, pp. 491-492, 2 figs. Describes apparatus made by Adam Hilger, Ltd., by which accurate standards of length can be originated; apparatus was ordered by Japanese Government because meter has been adopted as sole legal standard of length, and authorities wished to have apparatus by which residual error in existing international standard could be accurately measured, and other standards produced.

## LATHES

**Engine.** Unusual Engine Lathe Operations. Machy. (N. Y.), vol. 31, no. 3, Nov. 1924, pp. 207-211, 12 figs. Contains following articles: Arc Grinding in the Lathe. R. A. Black; Boring Concentric Slots. Phil. F. Shafran; Internal Spherical Turning. M. W. Kottawba; Deep-Hole Drilling Job. G. W. Jager; Winding a 300-Foot Coil Spring. J. J. Appel.

## MACHINE SHOPS

**Tooling for Small-Quantity Work.** Tooling for

Small Quantity Work. L. S. Love. Iron Age, vol. 114, no. 19, Nov. 6, 1924, pp. 1193-1196, 11 figs. Jobs not calling for bulk production put through on semi-production basis; savings accomplished by grouping operations. Practice at Schenectady works of Gen. Elec. Co.

## MACHINE TOOLS

**Automatic Machines.** Designing Automatic Machines. A. A. Dowd. Machy. (N. Y.), vol. 31, no. 3, Nov. 1924, pp. 212-215, 5 figs. Procedure in design, and use of simple models for analyzing problems met with.

## PRESSES

**Coining, Forging in.** Coining-Press Operation. A. R. Kelso. Soc. Automotive Engrs.—Jl., vol. 15, no. 5, Nov. 1924, pp. 399-406, 19 figs. Outlines development and tells how such machinery was adapted to speed up production of automobile parts, such as forged arms and levers, by squeezing process that superseded milling or spot-facing methods; details of squeezing operations and increase in production over that attained under former methods; photomicrographs showing grain structure of coin-pressed forgings. See also (abstract) in Am. Mach., vol. 61, no. 18, Oct. 30, 1924, pp. 685-688, 11 figs.

## PULVERIZED COAL

**Installation for Industrial Plant.** Clark Thread Co. Installs Pulverized-Fuel Equipment. Power, vol. 60, no. 19, Nov. 4, 1924, pp. 714-719, 10 figs. Typical pulverized coal installation for industrial plant; furnaces of 4270-sq. ft. Stirling boilers remodeled to burn either pulverized coal or oil; preparation plant is adjacent to point of unloading and coal is transported in pulverized form through 5-in. pipe line (placed underground) a distance of 600 ft. to boiler plant.

**Sheet Mills.** Pulverized Coal Used as Fuel in Sheet Mills. J. Glew. Iron & Steel Engr., vol. 1, no. 10, Oct. 1924, pp. 553-554, 4 figs. It has been found that where continuous-type furnaces have been used results have been much more gratifying than when batch-type furnace is employed; methods of using pulverized coal to get best results; design of furnace.

## SCREW THREADS

**Grinding Machine for.** The Wolseley Thread-Grinding Machine. Engineering, vol. 118, no. 3068, Oct. 17, 1924, pp. 546-548, 9 figs. Machine exhibited at British Empire Exhibition is suitable for production of gages, taps, and dies to very fine limits.

## STEAM

**High-Pressure.** Steam Generation at Extra High Pressures. V. Blomquist. Power, vol. 60, no. 19, Nov. 4, 1924, p. 745, 2 figs. Discusses economy of power generated by back-pressure turbine; improvements in economy which can be produced by bleeding steam for heating feedwater; points out that rotating tube boiler is practical solution of problem of high-pressure steam generation. (Abstract.) Paper presented at World Power Conference.

## STEAM GENERATORS

**Electric.** Electric Steam Generators. L. G. de Kermor. Eng. Jl., vol. 7, no. 11, Nov. 1924, pp. 673-677, 9 figs. Their development efficiency and operating costs; how they solve problem of utilization of surplus and off-peak energy.

## STEAM POWER PLANTS

**Swedish Practice.** Outstanding Features of Swedish Practice in Steam Power Production. H. A. Lundberg. Engineering, vol. 118, no. 3066, Oct. 3, 1924, p. 503. Points out that steam power in Sweden is mostly used for traction purposes and only in smaller degree for driving of mills; describes interesting types of plants and arrangements, typical of Swedish practice. (Abridged.) Paper read before World Power Conference.

## STEAM TURBINES

**Diaphragm Blades.** Making Steam Turbine Diaphragm Blades. Iron Age, vol. 114, no. 17, Oct. 23, 1924, pp. 1047-1051, 10 figs. Steel-foundry practice at Schenectady works of Gen. Elec. Co.; novel planer fixture permits planing at several angles with one clamping; centrifugal hobbing of large bearings; unusual radius tool.

**Impulse Blades and Nozzles.** The Proportioning of Impulse Blades and Nozzles. G. Stoney. Engineering, vol. 118, no. 3066, Oct. 3, 1924, p. 473, 3 figs. Consideration of effect of each factor involved in proportioning of blades and nozzles, and investigation of influence that error in assumed values of these factors has on final results.

**Performance Determination.** Turbine Performance from Steam-Quality Measurements. N. L. Johnson. Power, vol. 60, no. 18, Oct. 28, 1924, pp. 691-692, 1 fig. Points out that Thomas meter makes it possible to extend determination of turbine performance by measurements of steam quality to cases where exhaust steam is wet.

## STEEL

**Cold Working.** Cold-Working Steel Bars and Strips. S. Ashton Hand. Am. Mach., vol. 61, no. 17, Oct. 23, 1924, pp. 637-639, 6 figs. Annealing methods and temperatures at plant of Lancaster Steel Products Corp., Lancaster, Pa.; pickling, and neutralizing effect of acid; machines for drawing, straightening and cutting round stock; slitting and rolling strip steel.

## WAGES

**Group Wage-Payment Plan.** The Group Wage-Payment Plan. H. G. Perkins. Soc. Automotive Engrs.—Jl., vol. 15, no. 5, Nov. 1924, pp. 464-466. Fundamental requirements for success of system; outstanding results; reduction of labor cost and after effect; influence of employment situation; executives are kept better informed.

# THE ENGINEERING INDEX

(Registered United States, Great Britain and Canada)

**THE ENGINEERING INDEX** presents each month, in conveniently classified form, items descriptive of the articles appearing in the current issues of the world's engineering and scientific press of particular interest to mechanical engineers. At the end of the year the monthly installments are combined along with items dealing with civil, electrical, mining and other branches of engineering, and published in book form, this annual volume having regularly appeared since 1906. In the preparation of the Index by the engineering staff of The American Society of Mechanical Engineers some 1200 technical publications received by the Engineering Societies Library (New York) are regularly reviewed, thus bringing the great resources of that library to the entire engineering profession.

Photoprint copies (white printing on a black background) of any of the articles listed in the Index may be obtained at a price of 25 cents a page. When ordering photoprints identify the article by quoting from the Index item: (1) Title of article; (2) Name of periodical in which it appeared; (3) Volume, number, and date of publication of periodical; (4) Page numbers. A remittance of 25 cents a page should accompany the order. Order should be sent to the Engineering Societies Library, 29 West 39th Street, New York.

(See also page 58 of this issue for supplementary items.)

## ACCIDENT PREVENTION

**Traffic Accidents.** The Prevention of Traffic Accidents, H. E. Blain. Inst. Transport.—Jl., vol. 4, no. 7, May 1923, pp. 254-270, 9 figs. Statistics of railway and street accidents, and account of appliances and methods utilized in what is known as "safety campaign."

## ACCIDENTS

**Industrial.** Industrial Accidents and Hygiene, Lucian W. Chaney. Monthly Labor Rev., vol. 17, no. 4, Oct. 1923, pp. 131-149. Accident occurrence in iron and steel industry, 1922; coal-mine fatalities in United States in 1922; mine fatalities due to use of explosives; relation between labor turnover and industrial accidents; analysis of causes of 350,000 industrial accidents; industrial accidents in rubber industry; Austrian legislation for prevention of industrial poisoning; industrial poisons and diseases in British factories.

## AERONAUTICAL INSTRUMENTS

**Meteorographs.** A New Airplane Meteorograph (Ein neuer Flugzeug-Meteorograph), Albert Wigand and Heinrich Koppe. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no. 13-14, July 26, 1923, pp. 106-108, 3 figs. Details of new meteorograph and desiderata upon which design is based; describes how it should be attached to airplane.

**Types.** Measuring Instruments for Aeroplanes, E. Everling and H. Koppe. Eng. Progress, vol. 4, no. 6, June 1923, pp. 111-115, 17 figs. Service requirements; pressure meters; statoscopes; temperature; speed; climbing; turning.

## AIR COMPRESSORS

**Turbo-Compressors.** Modern Types of Large Compressors in Mining Practice (Neuzeitliche Grosskompressoren im Bergwerksbetrieb), Ernst Blau. Fördertechnik u. Frachtverkehr, vol. 16, no. 15, Aug. 3, 1923, pp. 171-173. Describes design and use of turbo-compressors and electrically driven compressors in mines.

## AIR COOLING

**Buildings.** Cooling Systems for Buildings, A. M. Feldman. Am. Architect & Architectural Rev., vol. 124, no. 2431, Oct. 24, 1923, pp. 379-384, 10 figs. Describes cooling equipment installed at banking offices of Kuhn, Loeb & Co., New York City, Mt. Sinai Hospital, New York City, and country residence of Paul M. Warburg at Hartsdale, N. Y.

## AIR FURNACES

**Oil-Fired.** Burning Oil in the Air Furnace, A. V. Landschoot. Foundry, vol. 51, no. 21, Nov. 1, 1923, pp. 862-867, 4 figs. Successful adaptation to melting malleable iron requires proper combustion, close control of heat and attention to charge time element.

## AIRPLANE ENGINES

**Calculations.** Aero-Engine Calculations. Practical Engr., vol. 68, no. 1907, Sept. 13, 1923, pp. 143-154. Formulas giving horsepower required to propel an airplane; calculation for power to drive gear-driven compressor; exhaust-gas turbo-compressor calculations; etc.

**Distribution in Multi-Cylinder.** The Arithmetic of Distribution in Multi-Cylinder Engines, Stanwood W. Sparrow. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 162, Oct. 1923, 23 pp., 15 figs. Consideration of effect on engine performance of known inequality of distribution.

## AIRPLANES

**Airfoils.** Note on the Experimental Aspect of One of the Assumptions of Prandtl's Aerofoil Theory, N. A. V. Piercy. Roy. Aeronautical Soc.—Jl., vol. 27, no. 154, Oct. 1923, pp. 501-511, 3 figs. Note is confined to assumption whereby vorticity in strictly limited region is in effect substituted for part of general action of viscosity; it is shown that viscosity as such is of fundamental importance in determining system of flow.

On the Vortex Pair Quickly Formed by Some Aerofoils, N. A. V. Piercy. Roy. Aeronautical Soc.—Jl., vol. 27, no. 154, Oct. 1923, pp. 488-500, 3 figs. Results of tests carried out in 4-ft. wind tunnel of aeronautical laboratory of East London College; author seeks to show that wing tip vortices are amenable to accurate investigation; deals with structure of vortex well on into turbulent flow.

The Supporting Vortex Surface as an Aid in the Treatment of Plane Problem of the Airfoil Theory (Die tragende Wirbelfläche als Hilfsmittel zur Behandlung des ebenen Problems der Tragflügeltheorie) W. Birnbaum. Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 4, Aug. 1923, pp. 290-297, 3 figs. It is shown how Prandtl's theory of "supporting vortex" can be used to include distribution of lift according to depth of airfoil in calculation, and to find dependence of this distribution on form of profile.

Theoretical Relationships for the Lift and Drag of an Aerofoil Structure, H. Glauert. Roy. Aeronautical Soc.—Jl., vol. 27, no. 154, Oct. 1923, pp. 512-518. Aerodynamic problems; cyclic flow; two-dimensional and three-dimensional problem.

**Angular Velocity in Pitch.** A Study of Controllability, Angular Velocity and Dynamic Stability of an Airplane About the Axis of Pitch, Leslie MacDill. Air Service Information Circular, vol. 5, no. 418, Apr. 1, 1923, 14 pp., 7 figs. Analysis of problem involving variations in longitudinal and vertical velocity, and angular velocity in pitch; study of steady motion and of small oscillations.

**Boulton and Paul.** The Boulton and Paul "Bodmin." Flight, vol. 15, no. 36, Sept. 6, 1923, pp. 528-533, 10 figs. Details of British all-metal biplane, incorporating unusual feature of twin engines placed in fuselage, with transmission drive to propellers placed on wings.

**Carriers for.** British Navy Aircraft Carriers. Engineering, vol. 116, no. 3018, Nov. 2, 1923, pp. 564-565, 8 figs. on supp. plates. Particulars of four carriers now on service or completing, three of which were converted for their present service, only one being specifically designed.

**Climbing Ability.** Determination of Climbing Ability, H. Blasius. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 166, Nov. 1923, 18 pp., 8 figs. Examination of conditions which shorten or lengthen climbing time. Translated from Technische Berichte, vol. 3, no. 6.

**Cycleplane.** Requirements of a Man Propelled Airplane, Matthew B. Sellers. Aviation, vol. 15, no. 20, Nov. 12, 1923, p. 608. Consideration of requirements and limitations of machine such as Gerhart cycleplane with propeller actuated by foot power.

**De-Havilland-53.** The De Havilland-53 Light "Plane." Flight, vol. 15, no. 39, Sept. 27, 1923, pp. 576-580, 12 figs. A low-wing monoplane, with two halves of wing hinged to fuselage and braced by compression struts above wing; 750-cc. Douglas engine; maximum speed about 70 m.p.h.

**Design.** Aeroplane Design, H. P. Folland. Instn. Aeronautical Engrs.—Proc., no. 3, 1922, pp. 3-19 and (discussion) 19-38, 27 figs. Author goes over preliminary design and gives rough approximations; draws attention to importance of detail design and points which go toward reliability, efficiency and engineering structure.

Constructional Design of Aeroplanes, C. W. Tinson. Instn. Aeronautical Engrs.—Proc., no. 4, 1922, pp. 3-26. Abstract of paper in three sections, including discussions.

**Dietrich D.P.II and D.P.III.** Two More New German Aeroplanes. Aeroplane, vol. 25, no. 11, Sept. 12, 1923, p. 276, 2 figs. Describes D.P.II, a two-seater cantilever-type biplane, fitted with either 5-cylinder 55-hp. or 7-cylinder 70-80-hp. Siemens-Halske engine; and the D.P.III, a six-passenger cantilever monoplane, fitted with any engine of about 230 hp., both produced by Dietrich Gobiet Flugzeugwerke A. G.

## Flying Boats. See FLYING BOATS.

**Gliders.** The New Rhön Gliders (Die neuen Rhön-Segelflugzeuge), W. v. Langsdorff. Motorwagen, vol. 26, nos. 25 and 26, Sept. 10 and 20, 1923, pp. 378-381 and 393-398. Details of participating machines in Rhön competition, 1923.

The Sinking Speed of Gliders (Die Sinkgeschwindigkeit der Segelflugzeuge), H. B. Helmbold. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no. 15-16, Aug. 31, 1923, pp. 121-122, 2 figs. Approximate method, with aid of alignment chart, of determining direct aerodynamic relation of minimum sinking speed to main dimensions of airplane.

**Gothenburg Exhibition.** Gothenburg International Aero Exhibition. Flight, vol. 15, nos. 30, 31, 32, 33 and 34, July 26, Aug. 2, 9, 16 and 23, 1923, pp. 423-432, 445-453, 481-484 and 508-511, 68 figs. Exhibits of Sweden, Holland, Italy, Czechoslovakia, Great Britain, France and Germany.

## Hangars. See HANGARS.

**Heinkel.** Progress in Airplane Construction (Neue Fortschritte im Flugzeugbau), R. Otte. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no. 13-14, July 26, 1923, pp. 104-106, 7 figs. Details of Heinkel H. E. 3 monoplane which can also be used as seaplane.

**Model Tests Without Wind Tunnel.** Experimental Data Without a Wind Channel, O. T. Gnospelius. Instn. Aeronautical Engrs.—Proc., no. 5, 1923, pp. 3-10 and (discussion) 11-17, 3 figs. Description of testing method, its advantages and disadvantages; mathematical analysis of lift and drag forces from pendulum observations.

**Motorgliders.** Lympe—Comments and Criticism. Aeroplane, vol. 25, no. 17, Oct. 24, 1923, pp. 419-420, 422 and 424, 2 figs. Technical comments of competition results as a whole and review of more striking peculiarities of individual competing machines.

On Motor gliding. Aeroplane, vol. 25, nos. 15 and 16, Oct. 10 and 17, 1923, pp. 361-362, 364 and 366; and 385-386, 388, 390, 392 and 394, 15 figs. Account of motorglider competition at Lympe. Utility of motor gliders; multi-cylinder power plant; drawbacks to motorgliders; low-wing monoplanes. See also article entitled Lympe Impressions, by W. H. Sayers, pp. 404 and 406-407, describing engines of competing airplanes at Lympe competition.

**Performance, Estimating.** Reliable Formulae for Estimating Airplane Performance and the Effects of Changes in Weight, Wing Area, or Power, Walter S. Diehl. Nat. Advisory Committee for Aeronautics—

# Classified List of Mechanical Equipment

## Manufactured by Firms Represented in MECHANICAL ENGINEERING

FOR ALPHABETICAL LIST OF ADVERTISERS, SEE PAGE 168

### Accumulators, Hydraulic

- \* Farrel Foundry & Machine Co.
- \* Mackintosh-Hemphill Co.
- \* Worthington Pump & Machinery Corp'n

### Air Coolers, Air

- \* Ingersoll-Rand Co.

### Air Compressors, Receivers, etc.

(See Compressors, Receivers, etc., Air)

### Air Conditioning Apparatus

- \* American Blower Co.
- \* Atmospheric Conditioning Corp'n
- \* Carrier Engineering Corp'n
- \* Clamage Fan Co.
- \* Sturtevant, B. F. Co.

### Air-Jet Lifts

- \* Schutte & Koerting Co.

### Air Washers

- \* American Blower Co.
- \* Atmospheric Conditioning Corp'n
- \* Carrier Engineering Corp'n
- \* Clamage Fan Co.
- \* Cooling Tower Co. (Inc.)
- \* Spray Engineering Co.
- \* Sturtevant, B. F. Co.

### Alloys (Calite)

- \* Calorizing Co.

### Ammeters

- \* Bristol Co.
- \* General Electric Co.
- \* Westinghouse Electric & Mfg. Co.
- \* Weston Electrical Instrument Co.

### Anemometers

- \* Taylor Instrument Cos.
- \* Weber, F. Co. (Inc.)

### Annealing

- \* American Metal Treatment Co.

### Arches, Boiler Furnace

- \* Liptak Fire-Brick Arch Co.
- \* McLeod & Henry Co.
- \* Titusville Iron Works Co.

### Arches, Fire Door

- \* McLeod & Henry Co.

### Arches, Ignition (Flat Suspended)

- \* Combustion Engineering Corp'n
- \* Liptak Fire-Brick Arch Co.
- \* McLeod & Henry Co.

### Asbestos Products

- \* Carey, Philip Co.
- \* Johns-Manville (Inc.)

### Autoclaves

- \* Farrel Foundry & Machine Co.

### Axles, Car

- \* Fuller-Lehigh Co.

### Babbitt Metal

- \* Medart Co.
- \* Westinghouse Electric & Mfg. Co.

### Balancing Machines, Dynamic

- \* Olsen, Tinius Testing Machine Co.

### Ball Bearings, Gages, etc.

(See Bearings, Gages, Ball)

### Balls, Brass and Bronze

- \* Gwilliam Co.

### Balls, Steel

- \* Atlas Ball Co.
- \* Gwilliam Co.
- \* New Departure Mfg. Co.
- \* S K F Industries (Inc.)

### Barometers

- \* American Schaeffer & Budenberg Corp'n
- \* Taylor Instrument Cos.

### Barometers, Mercurial

- \* Tagliabue, C. J. Mfg. Co.

### Bearings, Ball

- \* Fafnir Bearing Co.
- \* Gurney Ball Bearing Co.
- \* Gwilliam Co.
- \* New Departure Mfg. Co.
- \* Norma Co. of America
- \* S K F Industries (Inc.)
- \* U. S. Ball Bearing Mfg. Co.

### Bearings, Radial Thrust

- \* New Departure Mfg. Co.

### Bearing, Roller

- \* Gwilliam Co.
- \* Hyatt Roller Bearing Co.
- \* Norma Co. of America
- \* Royersford Fdry. & Mach. Co.
- \* Timken Roller Bearing Co.

### Bearings, Self-Oiling

- \* Brown, A. & F. Co.
- \* Doehler Die-Casting Co.

- \* Falls Clutch & Machinery Co.
- \* Jones, W. A. Fdry. & Mach. Co.
- \* Link-Belt Co.
- \* Royersford Fdry. & Mach. Co.
- \* Wood's, T. B. Sons Co.

### Bearings, Thrust

- \* Fafnir Bearing Co.
- \* General Electric Co.
- \* Gwilliam Co.
- \* Norma Co. of America
- \* S K F Industries (Inc.)
- \* Timken Roller Bearing Co.
- \* U. S. Ball Bearing Mfg. Co.

### Belt Dressing

- \* Dixon, Joseph Crucible Co.

### Belt Fasteners

- \* Flexible Steel Lacing Co.

### Belt Lacing (Hinge)

- \* Flexible Steel Lacing Co.

### Belt Lacing, Steel

- \* Bristol Co.

### Belt Tighteners

- \* Brown, A. & F. Co.
- \* Jones, W. A. Fdry. & Mach. Co.
- \* Link-Belt Co.
- \* Medart Co.
- \* Smith, F. L. & Co.
- \* Wood's, T. B. Sons Co.

### Belting, Canvas (Stitched)

- \* United States Rubber Co.

### Belting, Conveyor

- \* Goodrich, B. F. Rubber Co.
- \* United States Rubber Co.

### Belting, Elevator

- \* Goodrich, B. F. Rubber Co.
- \* United States Rubber Co.

### Belting, Leather

- \* American Sole & Belting Leather Tanners (Inc.)

### Belting, Rubber

- \* Goodrich, B. F. Rubber Co.
- \* United States Rubber Co.

### Bench, Work

- \* Manufacturing Equip. & Engrg. Co.

### Bending & Straightening Machines

- \* Long & Allstatter Co.

### Bends, Pipe

- \* Frick Co. (Inc.)
- \* Vogt, Henry Machine Co.

### Billets, Steel

- \* Timken Roller Bearing Co.

### Bleaching Machinery

- \* Philadelphia Drying Machinery Co.

### Blocks, Tackle

- \* Clyde Iron Works Sales Co.
- \* Roebling's, John A. Sons Co.

### Blowers, Centrifugal

- \* American Blower Co.
- \* Clamage Fan Co.
- \* De Laval Steam Turbine Co.
- \* General Electric Co.
- \* Ingersoll-Rand Co.
- \* Kerr Turbine Co.
- \* Sturtevant, B. F. Co.
- \* Westinghouse Electric & Mfg. Co.

### Blowers, Fan

- \* American Blower Co.
- \* Clamage Fan Co.
- \* Green Fuel Economizer Co.
- \* Sturtevant, B. F. Co.

### Blowers, Forge

- \* Sturtevant, B. F. Co.

### Blowers, Pressure

- \* American Blower Co.
- \* Clamage Fan Co.
- \* Lammert & Mann Co.
- \* Sturtevant, B. F. Co.

### Blowers, Rotary

- \* Fletcher Works
- \* Lammert & Mann Co.
- \* Schutte & Koerting Co.
- \* Sturtevant, B. F. Co.

### Blowers, Soot

- \* Diamond Power Specialty Corp'n
- \* Sturtevant, B. F. Co.

### Blowers, Steam Jet

- \* Schutte & Koerting Co.

### Blowers, Turbine

- \* Sturtevant, B. F. Co.

### Blueing (Metal)

- \* American Metal Treatment Co.

### Boards, Drawing

- \* Dietzgen, Eugene Co.
- \* Keuffel & Esser Co.
- \* Parvell Laboratories
- \* Weber, F. Co. (Inc.)

### Boiler Baffles

- \* King Refractories Co. (Inc.)
- \* McLeod & Henry Co.

### Boiler Compounds

- \* Dixon, Joseph Crucible Co.
- \* Unisol Mfg. Co.

### Boiler Coverings, Furnaces, Tube Cleaners, etc.

(See Coverings, Furnaces, Tube Cleaners, etc., Boiler)

### Boiler Fronts

- \* Brownell Co.
- \* O'Brien, John Boiler Works Co.
- \* Titusville Iron Works Co.

### Boiler Settings, Steel Cased

- \* Brownell Co.
- \* Casey-Hedges Co.
- \* McLeod & Henry Co.
- \* O'Brien, John Boiler Works Co.
- \* Vogt, Henry Machine Co.
- \* Walsh & Weidner Boiler Co.

### Boilers, Heating

- \* Brownell Co.
- \* Casey-Hedges Co.
- \* Erie City Iron Works
- \* Herbert Boiler Co.
- \* Keeler, E. Co.
- \* Leffel, James & Co.
- \* Lidgerwood Mfg. Co.
- \* O'Brien, John Boiler Works Co.
- \* Titusville Iron Works Co.

### Boilers, Water Tube (Horizontal)

- \* Babcock & Wilcox Co.
- \* Casey-Hedges Co.
- \* Cole, R. D. Mfg. Co.
- \* Connelly, D. Boiler Co.
- \* Edge Moor Iron Co.
- \* Erie City Iron Works
- \* Frost Mfg. Co.
- \* Herbert Boiler Co.
- \* Keeler, E. Co.
- \* Ladd, George T. Co.
- \* Morrison Boiler Co.
- \* O'Brien, John Boiler Works Co.
- \* Springfield Boiler Co.
- \* Union Iron Works
- \* Vogt, Henry Machine Co.
- \* Walsh & Weidner Boiler Co.
- \* Wickes Boiler Co.

### Boilers, Water Tube (Inclined)

- \* Babcock & Wilcox Co.
- \* Bigelow Co.
- \* Casey-Hedges Co.
- \* Keeler, E. Co.
- \* Ladd, George T. Co.
- \* Morrison Boiler Co.
- \* O'Brien, John Boiler Works Co.
- \* Vogt, Henry Machine Co.
- \* Walsh & Weidner Boiler Co.
- \* Ward, Charles Engineering Wks.

### Boilers, Water Tube (Vertical)

- \* Babcock & Wilcox Co.
- \* Bigelow Co.
- \* Casey-Hedges Co.
- \* Erie City Iron Works
- \* Keeler, E. Co.
- \* Ladd, George T. Co.
- \* Morrison Boiler Co.
- \* O'Brien, John Boiler Works Co.
- \* Walsh & Weidner Boiler Co.
- \* Wickes Boiler Co.

### Brake Blocks

- \* Johns-Manville (Inc.)

### Brakes, Air

- \* Allis-Chalmers Mfg. Co.
- \* General Electric Co.

### Brass Goods

- \* Scovill Mfg. Co.

### Brass Mill Machinery

- \* Farrel Foundry & Machine Co.

### Breechings, Smoke

- \* Brownell Co.
- \* Morrison Boiler Co.
- \* Titusville Iron Works Co.
- \* Vogt, Henry Machine Co.

### Brick, Fire

- \* Bernitz Furnace Appliance Co.
- \* Celite Products Co.
- \* Drake Non-Clinkering Furnace Block Co.
- \* Keystone Refractories Co.
- \* King Refractories Co. (Inc.)
- \* McLeod & Henry Co.

### Brick Insulating

- \* Celite Products Co.
- \* Quigley Furnace Specialties Co.

### Bridges, Coal & Ore Handling

- \* Brown Hoisting Machinery Co.
- \* Link-Belt Co.

### Brick Walls (Furnace)

- \* McLeod & Henry Co.

### Buckets, Elevator

- \* Brown Hoisting Machinery Co.
- \* Chain Belt Co.
- \* Gifford-Wood Co.
- \* Hendrick Mfg. Co.
- \* Jones, W. A. Fdry. & Mach. Co.
- \* Link-Belt Co.

### Buckets, Grab

- \* Brown Hoisting Machinery Co.
- \* Clyde Iron Works Sales Co.
- \* Lidgerwood Mfg. Co.
- \* Link-Belt Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

Report, no. 173, 1923, 22 pp., 10 figs. Contains derivation and verification of formulas for predicting speed-range ratio, initial rate of climb, and absolute ceiling of airplane.

#### Seaplanes. See SEAPLANES

**Speed Calculation.** Graphic Method for Calculating the Speed and Climbing Ability of Airplanes, Adolf Rohrbach and Edwin Lupberger. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 163, Oct. 1923, 10 pp., 4 figs. Method by means of which, starting from actual power developed by engine, it is possible to determine all factors which together constitute what are known as flight performances for any combination of engine and airplane, from single graphic diagram given herewith.

**Training and Sport.** The Training Airplane Mark R IV/23 (Das Schulfugzeug Mark R IV/23), C. W. Erich Meyer. Motorwagen, vol. 26, no. 25, Sept. 10, 1923, pp. 381-382, 4 figs. Describes light 2-seater training, sport and travel airplane equipped with 50-hp. engine.

#### ALLOYS

**Aluminum.** See ALUMINUM ALLOYS.

**Brass.** See BRASS.

**Contraction.** High Shrinkage Alloys. Brass World, vol. 19, no. 10, Oct. 1923, pp. 341-343. Results of investigation to determine linear contraction of a series of brass and bronze alloys used generally in foundry work. Abstract of paper by R. J. Anderson and E. J. Fahlman.

Modifications of the Law of Volumetric Shape and Contraction of Metals and Alloys (Ueber die Gesetzmässigkeiten der Volumengestaltung und Schwindung von Metallen und Legierungen), F. Sauerwald. Giesserei-Zeitung, vol. 20, no. 20, Sept. 15, 1923, pp. 391-393, 5 figs. Deals with binary alloys in liquid and solid state and during interval of solidification.

**Copper-Zinc.** Cold Rolling and Annealing of Some Copper-Zinc Alloys, Fendleton Powell. Brass World, vol. 19, nos. 9 and 10, Sept. and Oct., 1923, pp. 281-284 and 335-338, 42 figs. Results of experiments on influence of cold rolling upon annealed alloys and influence of heat treatment upon cold-rolled alloys. Abstract of report made to Technische Hochschule.

**Molybdenum in.** Molybdenum as an Alloy Component (Molybdän als Legierungsbestandteil), W. Guertler. Zeit. für Metallkunde, vol. 15, nos. 6 and 9, June and Sept. 1923, pp. 151-154 and 251-256, 17 figs. For alloys with molybdenum as main component, following additions can be used: carbon, silicon, titanium, zirconium, tungsten, tantalum and metals of the iron group which melt at high temperature, including vanadium; as addition molybdenum can be used only for such alloys in which iron, cobalt and nickel, or tungsten, tantalum and palladium constitute the main component.

#### ALUMINUM ALLOYS

**Duralumin.** See DURALUMIN.

**Uses.** The Use of Non-Ferrous Alloys in Place of Iron and Steel, John L. Haughton. Beama, vol. 13, no. 67, Nov. 1923, pp. 293-297, 2 figs. Consideration of aluminum alloys.

**Working Qualities.** The Workability of Aluminum-Casting Alloys with Special Regard to Silumin (Bearbeitbarkeit von Aluminiumlegierungen unter besonderer Berücksichtigung von Silumin), G. Welter. Werkstattstechnik, vol. 17, no. 18, Sept. 15, 1923, pp. 545-549, 7 figs. Results of tests with German and American alloys, and with silumin; behavior of different alloys in case of sawing, turning, milling, drilling, or thread-cutting; influence of lubrication.

#### AMMONIA CONDENSERS

**Design.** Ammonia Condenser Design, Oscar A. Anderson. Refrig. Eng., vol. 10, no. 4, Oct. 1923, pp. 115-117 and (discussion) 117 and 119-120. Characteristics of different types of condensers.

#### ARTILLERY

**Design.** Artillery Design, G. L'H. Ruggles. Army Ordnance, vol. 3, nos. 19 and 20, July-Aug. and Sept.-Oct. 1923, pp. 15-22 and 101-110, 11 figs. Requirements of Caliber Board and progress in artillery development thereunder; advantages and disadvantages of requirements, etc.

#### AUTOMOBILE ENGINES

**Ignition.** See IGNITION.

**Radiator Core.** New Radiator Core Has Aluminum Fins. Automotive Industries, vol. 49, no. 19, Nov. 8, 1923, p. 945, 2 figs. New form in which indirect radiating surface is of aluminum instead of constructional copper, developed by Stolp Co.

#### AUTOMOBILE MANUFACTURING PLANTS

**Citroën Shops, France.** Citroën Automobile Shops in France, Godfrey L. Carden. Iron Age, vol. 112, no. 20, Nov. 15, 1923, pp. 1310-1312, 5 figs. Equipment and methods.

**Ford River Rouge Plant.** Some Engineering Features of the Ford Plant at River Rouge, L. B. Breedlove. West. Soc. Engrs.—Jl., vol. 28, no. 10, Oct. 1923, pp. 472-484, 1 fig. Material-receiving facilities; new method of cleaning gas developed; coke-plant operation; conveyors for coal and coke handling; turbine power plant; utilization of blast-furnace gas; design of boilers; use of pulverized coal; foundry production system; cupola buildings; etc.

#### AUTOMOBILES

**A. C.** The Royal A. C. 16 Hp. Six-Cylinder Car. Auto-Motor Jl., vol. 28, no. 39, Sept. 27, 1923, pp. 811-814, 11 figs. Particulars of latest models of successful light six.

**Accessories.** The Olympia Motor Show, 1923. Accessories at the Show. Auto-Motor Jl., vol. 28, no. 43, Oct. 25, 1923, pp. 893-906, 54 figs. Brief descriptions of exhibits, arranged alphabetically according to exhibitors.

**Aster.** The 1924 Aster. Autocar, vol. 51, no. 1462, Oct. 26, 1923, pp. 740-750, 5 figs. Data on design, engine, ignition arrangements, and rear axle casing; 4-wheel brakes and optional magneto features of 6-cylinder chassis.

**Bean.** The New Bean Fourteen. Autocar, vol. 51, no. 1461, Oct. 19, 1923, pp. 695-698, 9 figs. Four-wheel brakes, four-speed gear box, wide track and capacious coachwork, form main features of car.

**Berliet.** The 15.9 Hp. Berliet Car. Auto-Motor Jl., vol. 28, no. 36, Sept. 6, 1923, pp. 749-752, 12 figs. To be had with standard French body or with special English finished body; monobloc 4-cylinder engine.

**Bodies.** Parisian Coachwork. Autocar, vol. 51, no. 1460, Oct. 12, 1923, pp. 639-642, 15 figs. Great advance in favor of fabric-covered saloon as substitute for wooden or metal panels and roofs.

**Bodies, Specifications.** Standard Specifications in Wood-Working, Roger Manning. Wood Worker, vol. 42, no. 8, Oct. 1923, pp. 56-68, 1 fig. How specification and direction of information covering every phase of woodworking is handled in one automobile body plant.

**Brakes.** Some Notes on Brake Design and Construction, H. M. Crane. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 395-398, 1 fig. Braking functions; desirable features of brake design; power available for operating brake; brake-operating mechanisms; design and construction of brake mechanism; types of brake drum and band or shoe design; brake materials.

**The Four-Wheel Brake Question.** Autocar, vol. 51, no. 1461, Oct. 19, 1923, pp. 701-703. Views of section of manufacturers who prefer to continue experiments before adopting them.

**British Show.** Front-Wheel Brakes Are Chief Features of British Show, M. W. Bourdon. Automotive Industries, vol. 49, no. 19, Nov. 8, 1923, pp. 932-939, 7 figs. Marked improvement noted in closed bodies; description of exhibits.

**Buick.** Two New Buick Models. Auto-Motor Jl., vol. 28, no. 36, Sept. 6, 1923, pp. 755-756, 2 figs. Describes new six-cylinder model, with four-wheel braking, and new four.

**Cleveland.** The Cleveland Six. Auto-Motor Jl., vol. 28, no. 40, Oct. 4, 1923, pp. 831-834, 9 figs. Details of design and construction; 45-hp. engine, having detachable head and overhead valves.

**Cluley.** The 15.7 Hp. Cluley Six. Autocar, vol. 51, no. 1460, Oct. 12, 1923, p. 643, 2 figs. Six-cylinder car with four-speed gear box and very complete equipment.

**German Show.** German Show Is Largest Ever Held Despite Economic Troubles, Benno R. Dierfeld. Automotive Industries, vol. 49, no. 16, Oct. 18, 1923, pp. 774-778, 13 figs. Large number of new small cars feature exhibition; 80 makers show 130 different models; four cars have aluminum engines.

**Headlights.** The Deglarescope, William S. Franklin and E. J. Benson. Tech. Eng. News, vol. 4, no. 4, Oct. 1923, pp. 128 and 154, 4 figs. Describes headlight developed by Prof. Wm. J. Dirsko and sets forth great increase of compatibility of its anti-glare and light-distributing functions.

**Lanchester.** A New 21 Hp. Lanchester. Autocar, vol. 51, no. 1459, Oct. 5, 1923, pp. 601-605, 8 figs. Four-wheel brakes, 4-speed gear box and 6-cylinder engine with overhead valve gear; details of design and construction.

**Mathis.** The Six-Cylinder Mathis. Auto-Motor Jl., vol. 28, no. 42, Oct. 18, 1923, pp. 871-874, 13 figs. New French model with 4-wheel braking.

**Maudslay.** A Six-Cylinder Maudslay. Autocar, vol. 51, no. 1461, Oct. 19, 1923, pp. 676b-678b, 8 figs. Highly developed touring car, with crankshaft, camshaft, and big ends on roller bearings, and new form of drive for two overhead camshafts; other features are 4-speed center bearing gear box, single-unit direct-driven starter and dynamo inside crankcase, and no spring shackles.

**Napier.** The 40-50 Hp. Napier Car. Auto-Motor Jl., vol. 28, no. 41, Oct. 11, 1923, pp. 851-854, 10 figs. Monobloc six-cylinder engine; details of design and constructions.

**Paris Show.** Notable Designs at Paris. Autocar, vol. 51, no. 1460, Oct. 12, 1923, pp. 633-636, 12 figs. Review of well-known chassis.

**Rhode.** The 9.5 H. P. Rhode Chassis. Automotive Engr., vol. 13, no. 181, Oct. 1923, pp. 290-297, 14 figs. Details of low-priced car with overhead-valve engine.

**Rover.** The 3 1/2-Litre Rover Six. Autocar, vol. 51, no. 1461, Oct. 19, 1923, pp. 687-690, 6 figs. Larger and entirely new car with 4-wheel brakes added to 1924 range.

**Ruston-Hornsby.** The 16 Hp. and 20 Hp. Ruston-Hornsby Chassis. Automotive Engr., vol. 13, no. 182, Nov. 1923, pp. 322-328, 15 figs. Details of cars which are claimed to be typical examples of British design, giving considerable attention to requirements and convenience of driver.

**Singer.** Singer Cars for 1924. Autocar, vol. 51, no. 1462, Oct. 26, 1923, pp. 747-748, 6 figs. Modifications of 10-hp. model; 15-hp. six-cylinder car unaltered; wide range of coachwork available.

**Star.** New Star, Selling for \$490, Leaves Ford Price Class. Automotive Industries, vol. 49, no. 19, Nov. 8, 1923, pp. 942-945, 9 figs. Improvements made in chassis and body construction; brake-rod layout changed.

**Steering Linkage.** The Automobile Steering Linkage, P. Cormack. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 46, no. 274, Oct.

1923, pp. 665-671, 4 figs. The concurrent equation; property of quadrilateral; approximate equation for design of quadrilateral; graphical solution of design problem.

**Sterling.** Sterling Now in Production on New Chassis with Four Body Models. Automotive Industries, vol. 49, no. 17, Oct. 25, 1923, pp. 840-841, 3 figs. Rubber shock insulators used at both ends of all springs; pressure lubrication to all crankshaft bearings and piston pins.

**Sunbeam.** The New 20 Hp. Sunbeam Six. Autocar, vol. 51, no. 1459, Oct. 5, 1923, pp. 607-608, 5 figs. Details of design and construction; overhead valve engine, 4-speed gear box, and 4-wheel brakes.

**Two New Sunbeam Cars.** Autocar, vol. 51, no. 1462, Oct. 26, 1923, pp. 745-746, 6 figs. Notes on six-cylinder 16-50-hp., and four-cylinder 12-30-hp. cars.

**Tire-Rim Manufacture.** Automobile Rims Made in Thirty Minutes, F. L. Prentiss. Iron Age, vol. 112, no. 19, Nov. 8, 1923, pp. 1233-1236, 6 figs. Rapid movement of material from raw stock pile to finished product in cars in new plant of Firestone Steel Products Co.

**Transmissions.** New Sliding Change Speed Gears Announced in Europe. Automotive Industries, vol. 49, no. 17, Oct. 25, 1923, pp. 830-833, 6 figs. Lavaud automatic transmission brought out in France; Constantinesco torque converter developed in England.

**Revolutionary Transmission.** Autocar, vol. 51, no. 1460, Oct. 12, 1923, pp. 647-650, 10 figs. Three modern mechanisms which may greatly influence automobile practice, namely, the De Lavaud system; Healey variable-speed gear box; and Constantinesco variable gear.

**Variable Transmission.** G. Constantinesco. Automobile Engr., vol. 13, no. 182, Nov. 1923, pp. 332-335, 2 figs. Deals with transmission gear developed by author, which he calls converter, as viewed from automobile standpoint, and compares its behavior with previous attempts to solve problem of transmission for automobiles.

**Windsor.** The 10.4 Hp. Windsor. Autocar, vol. 51, no. 1461, Oct. 19, 1923, pp. 685-686, 3 figs. New small car with 4-wheel brakes.

#### AVIATION

**Aerial Transportation.** The Development of Airship Transport, Aeroplane, vol. 25, no. 11, Sept. 12, 1923, pp. 273-274. Points out that the smaller and slower types of airship have distinct commercial possibilities; transport and development.

**Transporting Ore by Airplane.** Adrian Van Muffling. Eng. & Min. J.-Press, vol. 116, no. 19, Nov. 10, 1923, pp. 797-802, 5 figs. Problem of substituting airplanes for present means of transportation in carrying ore from outlying mines situated far from a railway. Factors to be considered in making analysis of given locality and in preparing a financial estimate, including landing fields, character of ore, flying equipment, etc.

**Night-Flying Mail Service.** Review of the Air Mail Night Flying Trials, Paul Henderson. Aviation, vol. 15, no. 17, Oct. 22, 1923, pp. 521-523. Thirty-day test recommended as basis of new coast-to-coast service; night-flying ships; attitude pilots; experimental operation.

#### AXLES

**Automobile Swaging.** Swaging Automobile Axles, John Williams. Am. Mach., vol. 59, no. 20, Nov. 15, 1923, p. 732, 3 figs. Application of process of swaging to making of axles whereby several turning operations are eliminated and saving of stock effected.

## B

#### BALANCING

**Weights, Dimensions of.** The Dimensions of Balance Weights. Mach. (Lond.), vol. 23, no. 577, Oct. 18, 1923, pp. 72-73, 3 figs. Consideration of dimensions of weights required to balance equivalent unbalanced mass at crankpin.

#### BALANCING MACHINES

**Lawaczek-Heymann.** The Balancing of Rotating Machine Parts (Das Auswuchten rotierender Maschinenteile), Ernst Lehr. Fördertechnik u. Frachtverkehr, vol. 16, no. 14, July 18, 1923, pp. 160-162, 3 figs. Describes Lawaczek-Heymann balancing machine which works on so-called double-pendulum principle.

**Static-Dynamic.** Some Developments in Balancing Machines, C. Norman Fletcher. Macy. (Lond.), vol. 23, no. 576, Oct. 11, 1923, pp. 52-53, 4 figs. Describes improvements made in Olsen-Carwen static-dynamic balancing machines.

#### BAROMETERS

**Types and Use.** The Meaning of Atmospheric Pressure, T. M. Gunn. Power, vol. 58, no. 21, Nov. 20, 1923, pp. 811-813, 3 figs. Types and principle of barometers for measuring atmospheric pressure, and their use; presents charts for finding barometrical pressure above sea level, and correction for latitude and temperature.

#### BEARINGS, BALL

**Roller and.** Some Developments in Ball and Roller Bearing Work, with Particular Reference to Steel Rolling Mill Plant, A. W. Macaulay. West. of Scotland Iron & Steel Inst.—Jl., vol. 39, parts 5-7, Feb.-Mar.-Apr., 1923, pp. 58-68 and (discussion) 69-73, 34 figs. on supp. plates. Deals with steel used in production of ball bearings and refers to recent developments regarding their application to steel works.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volumes

**The Question of Ball and Roller Bearings in Street-Railway Operation (Zur Frage der Kugel- und Rollenlager im Strassenbahnbetrieb),** H. Tobias. *Verkehrstechnik*, vol. 40, no. 38, Sept. 21, 1923, pp. 347-350. Results of investigations show that correctly designed ball and roller armature bearings are superior to journal bearings from viewpoint of safety in operation, saving in use of lubricating oil and in care and maintenance of motors.

#### BLAST-FURNACE GAS

**Dry Cleaning.** Filtering Dirty Gas Through Flue Dust, George B. Cramp. *Iron Age*, vol. 112, no. 17, Oct. 25, 1923, pp. 1111-1114, 2 figs. Dry cleaning of blast-furnace gas, based on tests at Monessen plant of Pittsburgh Steel Co.; calculation of areas required.

#### BOILER FEEDWATER

**Air Separator.** The Hickman Air Separator. *Soc. Mar. Rev.*, vol. 20, no. 11, Nov. 1923, pp. 528-529, 2 figs. Simple device for mechanical separation of entrained air from feedwater in steam plant, practically eliminating interior corrosion.

#### BOILER FURNACES

**Design.** Furnace Design (With Special Reference to Welsh Coal Burning), David Wilson. *South Wales Inst. Engrs.—Proc.*, vol. 38, no. 8, Sept. 26, 1923, pp. 723-738 and (discussion) 738-755, 9 figs. Function of fire grate and of combustion chamber; advantages of mechanical stokers, including saving in labor, high thermal efficiency, and large grate area.

**Forced Draft.** Forced Draft (Unterwind), H. Bergmann. *Archiv für Warmewirtschaft*, vol. 4, no. 8, Aug. 1923, pp. 151-152, 1 fig. Describes new type of grate which is departure from all previous designs and is said to fulfill all requirements for use of forced draft.

**Improvements.** New Furnaces (Neue Feuerungsanlagen), H. Pradel. *Feuerungstechnik*, vol. 11, nos. 20 and 21, July 15 and Aug. 1, 1923, pp. 204-205 and 211-213, 9 figs. Extension furnaces for traveling grates; low-temperature tar recovery in boiler furnaces; auxiliary oil furnaces; etc.

**Pulverized-Coal Plant.** A New Coal Dust Fuel Plant, G. Petri. *Eng. Progress*, vol. 4, no. 6, June 1923, pp. 119-121, 4 figs. Describes combined coal-dust fuel and chain-grate plant, main object of which is economical combustion of fuels which are difficult to ignite; principal fields of application.

**Steam-Jet.** The Modern Steam-Jet Furnace. *Gas J.*, vol. 163, no. 3149, Sept. 19, 1923, pp. 870-872, 5 figs. Scientific principles involved in design of an efficient forced-draft steam-jet furnace, as exemplified by latest developments in "turbine furnace."

**Temperature Control.** New Apparatus Successfully Controls Temperature. *Fuels & Furnaces*, vol. 1, no. 8, Oct. 1923, pp. 437-439, 4 figs. Describes automatic control devised by H. G. Geissinger, of Detroit, Mich., for fuel-fired furnaces; electricity used as motive force, and safety against overheating is assured if power supply fails.

#### BOILER PLANTS

**Efficiency, Increasing.** Prospects for Increasing the Efficiency of Boiler Plants (Die Leistungserhöhung der Dampfkesselanlagen und ihre Aussichten), August Loeche. *Zeit. des Bayerischen Revisions-Vereins*, vol. 27, nos. 15, 16 and 17, Aug. 15, 31 and Sept. 15, 1923, pp. 113-115, 121-123 and 130-132, 15 figs. Methods of enlarging or strengthening boiler plants and difficulties involved; other methods of increasing efficiency, such as alterations in superstructure, use of maximum-pressure boilers and utilization of heat-accumulator effect.

**Efficiency Meter.** The Gilson Efficiency Meter. *Engineering*, vol. 116, no. 3018, Nov. 2, 1923, pp. 558-559, 4 figs. Device for indicating continuously number of pounds of coal being burnt per kw-hr. in power station.

**Problems.** Power Problems of Vital Interest to Executives, James T. Beard, 2nd. *Indus. Management (N. Y.)*, vol. 66, no. 5, Nov. 1923, pp. 302-307, 5 figs. Maintenance and repairs.

**Steam-Production Costs Reduction.** How Steam Production Costs Were Reduced in a Hand-Fired Return-Tubular Boiler Plant, A. R. Mumford. *Southern Engr.*, vol. 40, no. 3, Nov. 1923, pp. 38-42, 1 fig. Original fuel cost to produce 1000 lb. steam was \$0.5287; simple changes reduced this cost to \$0.354 per 1000 lb. of steam, a saving of over 30 per cent in fuel cost.

#### BOILERMAKING

**Durr Works, Germany.** The Durr Boiler Works at Ratingen, Germany, Godfrey L. Carden. *Boiler Maker*, vol. 23, no. 10, Oct. 1923, pp. 273-276, 4 figs. Explains status of boiler design and construction in one of the largest shops in Europe devoted to boiler work and outlines tendency in design toward higher pressures and changes in types.

#### BOILERS

**Gas-Fired.** Town-Gas Fired Boilers. *Gas J.* (Supp.), vol. 163, no. 3150, Sept. 20, 1923, pp. 164-166, 3 figs. Describes Spencer-Bonecourt systems, with automatic action; comparison of costs and results obtained of solid fuel and town gas for boilers.

**Heat-Storage Problems.** The Heat Storage Problem With Special Regard to Elastic Efficiency of Boilers (Das Wärmespeicherproblem unter besonderer Berücksichtigung der Leistungselastizität von Dampfkesseln), Robert Jurenka and H. E. Witz. *Archiv für Warmewirtschaft*, vol. 4, no. 1, Oct. 1923, pp. 187-192, 17 figs. Under elastic efficiency is meant fluctuations which a boiler can sustain without noticeably affecting its efficiency; greatest possible elastic efficiency is obtained by use of hot-water storage, and combining hot-water and steam accumulators.

**Inspection.** Boiler Inspection. *Textile World*,

vol. 64, no. 9 and 14, Sept. 1 and Oct. 6, 1923, pp. 82, 85 and 87, 89-90 and 93, 1 fig. Preparation for inspection, points covered by inspectors, internal inspection; troubles and defects to be looked for and means of avoiding or overcoming them.

**Repairing.** Boiler Repair Methods at Columbus Shops. *Boiler Maker*, vol. 23, no. 6, June 1923, pp. 151-154 and 183, 7 figs. Details of plant of Pennsylvania Railroad at Columbus, Ohio, and some of the work done.

**Waste-Heat.** Why Not Harness the Engine Exhaust. L. H. Morrison. *Power*, vol. 58, no. 20, Nov. 13, 1923, pp. 765-767, 4 figs. Value of heat now wasted in exhaust of internal-combustion engines is pointed out, and types of waste-heat boilers in use and installation costs are outlined.

#### BOILERS, WATER-TUBE

**Developments.** Water-Tube Boiler and Crane Construction, James H. R. Kemnal. *Instn. Mech. Engrs.—Proc.*, vol. 4, June 1923, pp. 579-594 and (discussion) 594-608, 9 figs. History of development of water-tube boilers; air heaters vs. economizers. Description of electric jib crane fitted with luffing gear, and its use for luffing of jibs, shears and boats' davits.

**Edge Moor Single-Pass.** Edge Moor Single-Pass Boiler. *Power*, vol. 58, no. 20, Nov. 13, 1923, p. 769, 2 figs. New type of water-tube boiler embodying some new features.

#### BRASS

**Constitution.** The Constitution of Brass (Zur Konstitution des Messings), Georg Masing. *Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern*, vol. 3, no. 1, May 15, 1923, pp. 240-242, 3 figs. It is shown that beta-crystals under 470 deg. (cent.) develop in brass through diffusion and therefore contrary to prevailing assumption, are likewise constant in lower temperatures.

#### BUSES

**Trolley.** An English Front-Drive Trolley Bus. *Bus Transportation*, vol. 2, no. 4, Apr. 1923, pp. 181-182, 2 figs. Describes double-deck vehicle evolved by Trackless Cars Ltd., Leeds, England, having seating capacity of 64; stairway to upper deck inside; design incorporates provision for easy riding qualities.

**Birmingham's Experiment With Trolley Omnibuses.** A. Baker. *Elec. Ry. & Tramway J.*, vol. 49, no. 1202, Sept. 14, 1923, pp. 131-135 and (discussion) 135-142, 3 figs. Explains reasons which led Birmingham Corporation to pull up one of its tramways and substitute another system in its place; company's experience with new trolley-bus system. Concludes that for transport of large masses of people expeditiously and cheaply, tramcar has no competitor and still holds the field. Paper read before Mun. Tramways Assn.

## C

#### CABLEWAYS

**Curve Guides.** Automatic Curve-Guide for Rope Haulage Plant, G. Ryba. *Indus. Management (Lond.)*, vol. 10, no. 8, Oct. 18, 1923, pp. 229-230, 2 figs. Describes self-acting guides designed by A. Kralh, chief surveyor of Himmelfürst Pit, Hammer (Czechoslovakia), with which arrangement it is stated that tube run easily round curves, jockeys do not require such accurate adjustment, tube can be loaded above level of body, there is no lateral tension on rope, and latter cannot slip off guides. From *Montanische Rundschau*.

**Electric Suspension.** An Improvement in Suspension Railways (Eine Neuerung im Hängebahnwesen), G. A. Geipel. *Fördertechnik u. Frachtverkehr*, vol. 10, no. 15, Aug. 3, 1923, pp. 169-170, 6 figs. Describes so-called fixed-tongue switch and points out its advantages; control of driver's stand crab, of front and rear car; construction data for fixed-tongue crab.

**Pipe Conveying and Laying.** Ropeway Installation for Conveying and Laying Hydraulic Power Mains. *Indus. Management (Lond.)*, vol. 10, no. 8, Oct. 18, 1923, pp. 223-225, 3 figs. Describes ropeway used to convey and lay pipes for power mains from Hone to Bard, a district near Turin, for an extensive hydroelectric installation built for Società Idroelettrica di Villeneuve and Borgo-Franco, Turin; total length of line 1800 m. From *Ingegneria*, Aug. 1, 1923.

#### CAR DUMPERS

**Type.** Gantry Wagon Tips for Yards, River and Sea Ports, E. Krahn. *Indus. Management (Lond.)*, vol. 10, no. 9, Nov. 1, 1923, pp. 251-253, 7 figs. New type of car dumper built for harbor of Hanover by German Machine Works (DEMAG), Duisburg.

**Railway, Semi-Automatic.** Semi-Automatic Railroad Car Dumper. *Iron Age*, vol. 112, no. 20, Nov. 15, 1923, pp. 1324-1326, 3 figs. All motions except revolving are automatic; car held by clamps rigidly against blocking; only one motor.

#### CAR WHEELS

**Rolled Steel.** The Manufacture of Rolled Steel Wheels, G. A. Richardson. *St. Louis Ry. Club—Proc.*, vol. 28, no. 3, July 13, 1923, pp. 60-63. It is shown how standardization has immeasurably simplified problems of buying and selling.

#### CARBURETORS

**Claudel-Hobson.** The Claudel-Hobson Power Jet Carburetor. *Auto-Motor J.*, vol. 28, no. 41, Oct. 11, 1923, p. 858, 1 fig. New carburetor which gives extra power by an auxiliary jet at full throttle.

#### CARS

**Wheel, Gear and Axle Practice.** Wheel, Gear and Axle Practice. *Elec. Ry. J.*, vol. 62, nos. 7 and 17, Aug. 18 and Oct. 27, 1923, pp. 245-250 and 729-736, 25 figs. Findings resulting from survey of 60 electric railways; mileage obtained and costs resulting from operation of cast iron and steel wheels; conditions limiting life obtained from wheels and expedients used to increase mileage of wheels in service; methods, equipment and shop arrangement used in maintaining wheels and axles.

#### CARS, COAL

**Composite Hopper.** Composite Hoppers for the Nickel Plate. *Ry. Mech. Engr.*, vol. 97, no. 11, Nov. 1923, pp. 754-756, 6 figs., also *Ry. Age*, vol. 75, no. 16, Oct. 20, 1923, pp. 703-704, 3 figs. Wooden sides and flooring are found to be more economical than all steel in cost of building and maintenance.

**Planned Repetitive Manufacture.** Planned Repetitive Manufacture of Heavy Equipment—Steel Coal Cars, William B. Ferguson. *Management & Administration*, vol. 6, no. 5, Nov. 1923, pp. 585-592, 11 figs. Deals with manufacturing to order or on contract small number of articles of same design; example selected is that of order of 1500 steel coal cars, hopper type of 57½-ton cap., manufactured for Chesapeake & Ohio R. R.

#### CARS, FREIGHT

**Platform.** Platform and Low-Loading Cars for Industrial Railways (Schwerlast- und Tiefladewagen für bodenständige Bahnen), H. Buhle. *Fördertechnik u. Frachtverkehr*, vol. 16, no. 18, Sept. 18, 1923, pp. 201-206, 19 figs. Standard-gage platform cars, low-loading cars and special types of heavy-load cars built by Fried. Krupp Corp.; low-platform cars of Hannover Machine-Bldg. Corp.; other German types of low-loading cars.

#### CARS, PASSENGER

**Manufacture.** Mass Production of Railway Carriages. *Ry. Gaz.*, vol. 39, no. 15, Oct. 12, 1923, pp. 449-454, 15 figs. Describes system recently introduced at Derby Carriage & Wagon Works of Lond., Midland & Scottish Ry., based on use of limit gages, main object of which is, by means of production methods to increase output capacity of works.

**Sleepers.** New Sleeping Cars, Buenos Ayres Great Southern Railway. *Ry. Gaz.*, vol. 39, no. 18, Nov. 2, 1923, p. 553, 2 figs. There are two compartments of four berths each, and remainder are two-berth compartments; coach is divided into two portions by a central entrance, compartments being in blocks of 16 and 14 berths respectively, in positions diagonally opposite; length over buffers 81 ft.; width over side matching 10 ft. 6 in.; weight 43 tons.

**Sleeping Cars on the London & North Eastern Railway.** *Ry. Gaz.*, vol. 39, no. 15, Oct. 12, 1923, pp. 460-461, 4 figs. Comparison between two single-unit cars and a twin car on articulated principle.

#### CAST IRON

**Marine-Engine Castings.** A Note upon Cast Iron for Marine Engine Castings from the Metallurgical and Engineering Points of View, H. J. Young and E. Wood. *Inst. Mar. Engrs.—Trans.*, vol. 11, no. 5, Oct. 1923, pp. 209-221, 8 figs. Deals with more common difficulties of work, as met by engineer and chemist working in coöperation.

#### CASTINGS

**Defects.** Defective Ferrous and Non-Ferrous Castings, Wallace Dent Williams. *Can. Foundryman*, vol. 14, nos. 9 and 10, Sept. and Oct. 1923, pp. 18-19 and 21, and 18-19, 7 figs. Reviews defects and considers some specially manufactured pieces and expresses his opinion as to best method of manufacturing such pieces.

#### CENTRAL STATIONS

**Gas-Engine-Driven.** Gas Driven Alternators for South Africa. *S. African Min. & Eng. J.*, vol. 34, no. 1663, Aug. 11, 1923, pp. 677-678. Describes power plant of Salisbury central station, at Rhodesia, to consist of two Browett-Lindley 4-cylinder vertical 4-stroke-cycle gas engines, each direct coupled to a 300-kw. alternator with exciter, and four 300-hp. double-draft gas producers; description of gas producers, gas engines and alternator.

**Interconnection.** Interconnection in New York State. *Elec. World*, vol. 82, no. 20, Nov. 17, 1923, pp. 1013-1016, 1 map on supp. plate. Study of proposed inter-company network designed to give largest power pool in America; itemization of savings, operating procedure and control; recommendation for immediate development. Present situation with reference to interconnection in New York and neighboring states is shown in map.

#### CHAIN DRIVE

**Types.** Points to Consider in Using Various Types and Kinds of Chain Drives, Frank E. Gooding. *Indus. Engr.*, vol. 81, nos. 7, 8 and 9, July, Aug. and Sept. 1923, pp. 335-339 and 373-373, 379-382, and 432-437 and 470, 28 figs. Salient characteristics and considerations which govern selection of different types of chain drives for various purposes; information regarding service conditions which should be known and used as basis for specifying proper chain for given drive; practical details of specific installations.

#### CHARTS

**Semi-Logarithmic.** The Semi-Logarithmic Chart, Allan C. Haskell. *Indus. Management (N. Y.)*, vol. 66, no. 5, Nov. 1923, pp. 300-301, 5 figs. Use of semi-logarithmic charts to measure relative on percentage variations; their value for showing percentage variations.

**Thermotechnical Calculations.** Nomographical Method for the Solution of Thermotechnical and

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

Mathematically Related Problems (Nomographische Verfahren zur Lösung wärmetechnischer Probleme sowie mathematisch verwandter Aufgaben), Felix Wolf. Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 77-93, 19 figs. Presents differential equation which is integrated and exemplifies its application to physical phenomena.

#### CHIMNEYS

**Heat Losses in.** Analysis of Heat Losses in Chimneys According to the CO<sub>2</sub> Content of the Exhaust Gases (Zur Beurteilung der Wärmeverluste im Schornstein nach dem CO<sub>2</sub>-Gehalt der Abgase), L. Litinsky. Feuerungstechnik, vol. 11, no. 2, Aug. 15, 1923, pp. 217-219. Chimney losses when firing with solid fuels; losses in connection with excess air with gaseous fuels; necessity of analysis of fuels.

**Steel.** Steel Chimneys. Indian & Eastern Engr., vol. 52, no. 1, July 1923, pp. 14-16a, 8 figs. Necessity for support; details of design; venturi type of stack; advantages of steel over brick chimneys.

**Tall.** Tall Chimneys, W. Wallace Christie. Combustion, vol. 9, no. 5, Nov. 1923, pp. 368-374 and 383, 16 figs. Discusses chimney bases, shafts, lightning protection, masonry, steel chimneys, venturi type, concrete stacks, and describes various types, including some exceptionally tall chimneys.

#### CHROME-VANADIUM STEEL

**Analysis.** The Analysis of Chrome-Vanadium Steel, G. E. F. Lundell, J. I. Hoffman and H. A. Bright. Indus. & Eng. Chem., vol. 15, no. 10, Oct. 1923, pp. 1064-1069. Particular emphasis is paid to determinations which are troublesome in analysis of chrome-vanadium steel, namely, chromium, vanadium, and manganese.

#### CLUTCHES

**Centrifugal.** Centrifugal Clutches. Practical Engr., vol. 68, nos. 1903 and 1904, Aug. 16 and 23, pp. 87-90 and 102-104, 17 figs. Advantages of various types of clutches; details of design and application.

**Friction.** A Review of Power Transmission Machinery. Belting, vol. 23, no. 3, Sept. 1923, pp. 36, 38 and 40, 13 figs. Description of Johnson, Lawton, Farrel, O. K., Hanson and Mule-Pull types of friction clutches.

#### COAL

**Illinois.** Analyses of. Analyses of Illinois Coals, G. W. Hawley. State of Ill. Dept. Registration and Education, Division of State Geol. Survey, Bul. no. 27, 1923, 68 pp., 1 fig. Analytical data of study of chemical character of Illinois coals based on new face samples collected in 1921 from approximately 100 mines in various parts of the state with a view to extending knowledge of chemical properties, heating quality, and special adaptability of Illinois coals.

#### COAL HANDLING

**Conveyors.** Mechanical Equipment Cuts Cost of Handling Coal, Russell B. Williams. Contract Rec. & Eng. Rev., vol. 37, no. 42, Oct. 17, 1923, pp. 992-993, 3 figs. Describes portable belt conveyor which piled coal at a cost of 15 cents per ton as against 40 cents by hand.

**Floating Plants.** Floating Coal-Handling Plants for Seaports (Schwimmende Kohlenverladeanlagen für Seehäfen), E. Krahen. Fördertechnik u. Frachtverkehr, vol. 16, no. 16, Aug. 18, 1923, pp. 181-183, 5 figs. Floating steam slewing cranes for discharging coal from steamers; coal hoists for unloading coal steamers; coal hoists designed as coal ships for coaling steamers.

**Piers.** Immense Coal Pier of Virginian Railway Under Construction at Norfolk. Mfrs. Rec., vol. 84, no. 18, Nov. 1, 1923, pp. 97-99, 5 figs. Structure with 7200-ton-per-hr. capacity, features of which are car dumpers, elevator, 130-ton conveying cars, traveling towers with mechanical trimmers, all electrically operated.

#### COKE HANDLING

**Loading and Transportation.** Coke Loading and Transportation (Kokslösung und Kokstransport) I. Rodde. Gas- u. Wasserfach, vol. 66, nos. 35, 36, 38, 40 and 42, Sept. 1, 8, 22, Oct. 6 and 20, 1923, pp. 521-524, 543-545, 568-570, 593-596 and 618-623, 11 figs. Discusses following aspects: Loading, transporting and storing; conditions which influence appearance of coke; thermotechnical and gas-technical considerations; simplicity of system; economical results; hygiene.

#### COLD STORAGE

**Warehouse.** Cold Storage Warehouse Has Unusual Design, Stewart T. Smith. Eng. News-Rec., vol. 91, no. 16, Oct. 18, 1923, pp. 633-635, 5 figs. Insulation requirements complicate design; railway track enters at third-floor level; asphalt and plaster wall coating put on with spray and cement gun.

#### CONDENSERS, STEAM

**Steam Injectors and Water-Jet Pumps.** Steam Injectors and Water-Jet Pumps in Condenser Plants (Dampfstrahlpumpe und Wasserstrahlpumpe bei Kondensationsanlagen), L. Heuser and K. Finzel. Schiffbau, vol. 24, no. 51-52, Sept. 19-26, 1923, pp. 785-791, 5 figs. Comparative tests show superiority of steam injectors over water-jet pumps.

**Surface.** Surface Condensers, John M. Drabell-Sibley Jr. of Eng., vol. 37, no. 7, Oct. 1923, pp. 155-156 and 174. Factors that govern securing and maintaining of low absolute pressures.

**Surface, Air Pumps for.** The Selection of Air Pumps for Surface Condensers. Shipbldg. & Shipp. Rec., vol. 22, no. 15, Oct. 11, 1923, p. 452. Air capacity under working conditions; air in pump.

**Tubes.** Contributions to the Study of Corrosion of

Condenser Tubes (Beiträge zur Kenntnis der Korrosion an Kondensatorrohren), E. Maas, and E. Liebreich. Zeit. für Metallkunde, vol. 15, no. 9, Sept. 1923, pp. 245-250, 6 figs. Account of tests carried out at Chem.-Tech. State Inst., Berlin; recommendations for treatment of surface of condenser tubes; increased protection of zinc-rich brass against local corrosion.

**Determining the Economical Interval between Cleanings of Condenser Tubes.** C. E. Colborn. Power, vol. 58, no. 21, Nov. 20, 1923, pp. 803-805, 4 figs. Most economical period between tube cleanings depends upon how fast sediment is deposited, cost of vacuum loss which varies with relative load to large extent, and cost of cleaning tubes.

#### CONVEYORS

**Assembling.** Speeding Up Transmission Assembling. Am. Mach., vol. 59, no. 17, Oct. 25, 1923, pp. 617-618, 5 figs. Installation of simple assembling conveyor increases output of same crew over 50 per cent.

**Automobile Manufacturing Plants.** The Application of Conveyor Equipment to a Small Production Plant, H. P. Harrison. Soc. Automotive Engrs.—Jl. vol. 13, no. 5, Nov. 1923, pp. 357-365, 25 figs. Conditions that determined whether power-driven or gravity-actuated conveyors should be used; various types required for handling raw stock, for machining operations, sub-assemblies and finished assemblies; conveyors for handling cylinder castings; handling parts between departments and machines; assembling transmissions, engines and axles; handling finished cars through final-inspection and touch-up operations; etc.

**Bread-Cooling.** Bread Cooling Conveyor, George Frederick, Zimmer. Indus. Management (Lond.), vol. 10, no. 9, Nov. 1, 1923, pp. 256-258, 3 figs. Describes system installed at bakery in Milwaukee, Wis.

**Overhead.** The Adaptability of the Overhead Conveyor, Matthew W. Potts. Indus. Management (N. Y.), vol. 60, no. 5, Nov. 1923, pp. 292-299, 10 figs. Deals with hoists, monorails and telfers.

**Wood Shavings.** Modern Shaving Conveyor Plant, Martell. Eng. Progress, vol. 4, no. 8, Sept. 1923, pp. 198-199, 4 figs. Construction of a shaving conveyor and dust-removing plant; describes piping, hoods, floor aspirators and sweep holes, wood separator, and shavings and dust separators.

#### COOPERATIVE SOCIETIES

**Developments.** Cooperation. Monthly Labor Rev., vol. 17, no. 4, Oct. 1923, pp. 184-195. Comparative study of cooperation in various countries; development of various types of cooperative societies; consumers' societies; court decision as to contract with cooperative marketing association, Kansas; development of building loan associations in United States; strike of employees of English cooperative wholesale Society.

#### CORROSION

**Tests.** The Control of Motion and Aeration in Corrosion Tests, J. F. Thompson and R. J. McKay. Indus. & Eng. Chem., vol. 15, no. 11, Nov. 1923, pp. 1114-1118, 4 figs. Discusses mechanism by which variation in aeration and rate of motion affects corrosion rate; gives test method of control sufficiently accurate to reproduce results within about 5 per cent; results obtained in connection with series of 2000 tests on acid-resisting metals in 2 to 10 per cent sulphuric acid, duplicating conditions found in pickling steel sheets.

#### COST ACCOUNTING

**Factory.** Linking Accounting to Production, Ernst Just. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 491-493. Development of New German system of factory accounting called "energetic" method; principles and applications of which are explained; how assets at rest, consumed, newly produced and total assets are dealt with.

**Precalculation and Economic Production (Vorkalkulation und wirtschaftliche Fertigung),** C. Riedrich. Werkstattstechnik, vol. 17, no. 20, Oct. 15, 1923, pp. 599-600, 2 figs. Points out importance of modern factory organization with special regard to functions of cost finding and its difficulties when organization is not up-to-date.

**Methods.** "Is Our Investment in Cost Accounting Profitable?" Thomas W. Howard. Factory, vol. 31, nos. 2, 3, 4, 5, Aug., Sept., Oct. and Nov. 1923, pp. 172-174, 216 and 218; 318-321; 466-467, 512, 514, 516 and 518, 3 figs.; and 605-607, 1 fig. Consideration of questions in effective cost accounting from viewpoint of executive. Aug.: Common leaks and ways to stop them. Sept.: What the different cost methods are. Oct.: Job-cost method and where it works best. Nov. specification costs and how they compare with job costs.

#### CRANES

**Cableway.** Calculation of Ropes for Cableway Cranes (Zur Berechnung der Tragselle von Kabelkranen), V. Hirschhaut. Fördertechnik u. Frachtverkehr, vol. 16, no. 14, July 18, 1923, pp. 162-163. Simplified method of calculation.

**Electric.** Electric Cranes, Daniel Adamson. Elec. Rev., vol. 93, no. 2395, Oct. 19, 1923, pp. 567-568. Methods of electric control; crane protective panels; contractor panels.

**Electrically Operated** 25 t. Goliath Crane at the Goods Station at Zurich, W. Druey. Int. Ry. Congress—Bul., vol. 5, no. 10, Oct. 1923, pp. 961-962, 1 fig. Describes crane designed for loading and unloading furniture vans; also provided with auxiliary crabs for handling all types of goods. From Bul. Technique de la Suisse Romande.

**Portable Battery.** Three-Motor Portable Battery Crane, Engineering, vol. 116, no. 3018, Nov. 2, 1923, p. 558, 4 figs. Especially designed for handling

freight on freight platforms; battery is Exide Iron-clad type and has capacity of 258 ampere-hr. on 5-hr. rating.

#### CUPOLAS

**Heat Balance.** The Heat Balance of Cupolas (Die Wärmebilanz des Kupolofens), Giesserei-Zeitung, vol. 20, nos. 21 and 22, Oct. 1 and 15, 1923, pp. 412-415 and 429-431, 4 figs. Comparison of different analyses; probable values in ordinary practice; elements of heat balance; remarks on changes of separate expressions in heat balance; tests with re-dressed coke; heating cupola with pulverized coal or with heavy oil; use of hot air in cupolas for cast iron.

**Waste-Heat Utilization.** Utilizing the Waste Heat from the Cupola, G. Ernest Booker. Iron & Steel of Canada, vol. 6, no. 10, Oct. 1923, pp. 211-212, 4 figs. Ways in which heat of fuel consumed in operation of a foundry cupola can be used profitably.

#### CUTTING METALS

**Oxygen Blowpipe Machine.** The Oxytome Metal Cutting Machine, Engineer, vol. 136, no. 3537, Oct. 12, 1923, p. 404, 2 figs. Oxygen blowpipe machine developed by Alfred Herbert, Ltd., Coventry, England.

#### CUTTING TOOLS

**Sharpening System.** Centralized Cutter Sharpening System, Charles O. Herb. Machy. (N. Y.), vol. 30, no. 3, Nov. 1923, pp. 205-207, 7 figs. System for keeping machines supplied with sharp tools, developed at plant of Willys-Overland Co.

## D

#### DIESEL ENGINES

**Deutz Compressorless.** Horizontal Diesel Motor Without Compressor. Eng. Progress, vol. 4, no. 9, Sept. 1923, pp. 181-184, 15 figs. Particulars of Deutz engines, Diesel engines without compressor and economic fuel consumption.

**Marine.** Marine Diesel Engine of 1600 Hp. (Schiffsdieselmotor von 1600 PS. der Motorenwerke Mannheim A.-G. vorm. Benz & Cie. in Mannheim), E. Josse. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 43, Oct. 27, 1923, pp. 1010-1012, 7 figs. Reversible 6-cylinder engine built by Mannheim Motorwerke, Inc., formerly Benz & Cie.; equipped with guide instead of crosshead, by which dimensions and weight of engine are reduced; results of 72-hr. trial; fuel and heat consumption; mechanical efficiency.

**McIntosh & Seymour's New Big Diesel.** Motorship, vol. 8, no. 11, Nov. 1923, pp. 772 and 775, 1 fig. American-designed marine engine of 2250 i.hp. which has completed successful trials.

#### DRILLING MACHINES

**Radial.** Improved Girder Radial Drilling Machines. Eng. Production, vol. 6, no. 134, Nov. 1923, p. 451, 1 fig. Describes 6-ft. machine constructed by George Swift & Sons, Ltd., Halifax, for operation upon girder and structural work, boiler and tank plates, etc.

**Rotary Indexing Table.** A New Drilling Device. Eng. Production, vol. 6, no. 134, Nov. 1923, p. 447, 3 figs. Describes device developed by Leyland Motors, Ltd., Leyland, Lancashire, Eng., to eliminate marking out in connection with drilling of circles of holes, comprising a rotary work table capable of being indexed radially.

#### DRYING

**Process Chart.** Graphic Presentation of Processes of Drying (Einiges aus dem Bilderbuch über Trocknungsvorgänge), Karl Reyscher. Gesundheits-Ingenieur, vol. 46, no. 42, Oct. 20, 1923, pp. 414-416, 3 figs. Describes simplified method by use of which diagram is obtained visualizing complicated phenomena of drying.

#### DURALUMIN

**Tension Tests.** Test on Riveted Joints in Sheet Duralumin, H. F. Rettew and G. Thumin. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 165, Nov. 1923, 7 pp., 3 figs. Results of tension tests on various forms of single-riveted lap joints. Abstracted and revised from thesis presented to Dept. of Mech. Eng. of Mass. Inst. of Technology.

## E

#### EDUCATION, ENGINEERING

**Fundamental Studies.** Education for the Functional Divisions of Engineering, Edward Bennett. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1145-1152. Presents for consideration courses of study in which fundamental studies of first two years are not identically same in all courses, but are avowedly different both in content and in aim; each course is intended to provide foundation for what is designated as one of basic types of engineering work or as one of functional divisions of engineering, these divisions being listed as engineering research, design, supervision, management, and sales.

#### ELECTRIC DRIVE

**Hemp Spinning Mill.** Electric Drives in a Hemp Spinning Mill (Elektrische Antriebe in einer Hanf-spinnerei), Willi Mühlens. Siemens-Zeit., vol. 3, no. 8-9, Aug.-Sept. 1923, pp. 341-349, 10 figs. Describes success of use of electric drive, especially individual electric drives.

- (Reading Valve & Fittings Div.)
- \* Vogt, Henry Machine Co.

**Floor Armor**

- \* Irving Iron Works Co.

**Floor Stands**

- \* Chapman Valve Mfg. Co.
- \* Crane Co.
- \* Jones, W. A. Fdry. & Mach. Co.
- \* Kennedy Valve Mfg. Co.
- \* Lunkenheimer Co.
- \* Pittsburgh Valve, Fdry. & Const. Co.
- \* Reading Steel Casting Co. (Inc.)
- (Pratt & Cady Division)
- \* Schutte & Koerting Co.
- \* Wood's, T. B. Sons Co.

**Flooring-Grating**

- \* Irving Iron Works Co.

**Flooring, Metallic**

- \* Irving Iron Works Co.

**Flooring, Rubber**

- \* United States Rubber Co.

**Flour Milling Machinery**

- \* Allis-Chalmers Mfg. Co.

**Flue Gas Analysis Apparatus**

- \* Tagliabue, C. J. Mfg. Co.

**Fly Wheels**

- \* Medart Co.
- \* Nordberg Mfg. Co.
- \* Wood's, T. B. Sons Co.

**Forges**

- \* Best, W. N. Corp'n

**Forgings, Alloy Steel**

- \* American Forge & Machine Co.

**Forgings, Drop**

- \* American Forge & Machine Co.
- \* Vogt, Henry Machine Co.

**Forgings, Heavy**

- \* American Forge & Machine Co.

**Forgings, Iron and Steel**

- \* American Forge & Machine Co.

**Forgings, Steel**

- \* American Forge & Machine Co.

**Foundry Equipment**

- \* Northern Engineering Works
- \* Whiting Corp'n

**Friction Clutches, Hoists, etc.**

- (See Clutches, Hoists, etc., Friction)

**Friction Drives**

- \* Rockwood Mfg. Co.

**Frictions, Paper and Iron**

- \* Link-Belt Co.
- \* Rockwood Mfg. Co.

**Fuel Economizers**

- (See Economizers, Fuel)

**Furnace Construction**

- \* Furnace Engineering Co.

**Furnaces, Annealing and Tempering**

- \* Best, W. N. Corp'n
- \* General Electric Co.
- \* Kenworthy, Chas. F. (Inc.)
- \* Whiting Corp'n

**Furnaces, Boiler**

- \* American Engineering Co.
- \* American Spiral Pipe Wks.
- \* Babcock & Wilcox Co.
- \* Bernitz Furnace Appliance Co.
- \* Best, W. N. Corp'n
- \* Combustion Engineering Corp'n
- \* Detroit Stoker Co.
- \* Riley, Sanford Stoker Co.

**Furnaces, Case Hardening**

- \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Down Draft**

- \* O'Brien, John Boiler Works Co.

**Furnaces, Electric**

- \* Detroit Electric Furnace Co.
- \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Forging**

- \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Hardening**

- \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Heat Treating**

- \* Best, W. N. Corp'n
- \* General Electric Co.
- \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Melting**

- \* Best, W. N. Corp'n
- \* Detroit Electric Furnace Co.
- \* General Electric Co.
- \* Whiting Corp'n

**Furnace, Non-Ferrous**

- \* Detroit Electric Furnace Co.

**Furnaces, Non-Oxidizing**

- \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Oil**

- \* Best, W. N. Corp'n

**Furnaces, Smokeless**

- \* American Engineering Co.
- \* Babcock & Wilcox Co.
- \* Combustion Engineering Corp'n
- \* Detroit Stoker Co.
- \* Herbert Boiler Co.
- \* Riley, Sanford Stoker Co.

**Fuses**

- \* General Electric Co.
- \* Johns-Manville (Inc.)

**Gate Boards**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Crosby Steam Gage & Valve Co.

**Gage Glasses**

- \* American Schaeffer & Budenberg Corp'n

**Gage Glasses, Inclined**

- \* Secure Water Gauge Co.

**Gage Testers**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Crosby Steam Gage & Valve Co.

**Gages, Altitudes**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Crosby Steam Gage & Valve Co.

**Gages, Ammonia**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Crosby Steam Gage & Valve Co.
- \* Vogt, Henry Machine Co.

**Gages, Differential Pressure**

- \* American Schaeffer & Budenberg Corp'n
- \* Bacharach Industrial Instrument Co.
- \* Bailey Meter Co.
- \* Tagliabue, C. J. Mfg. Co.
- \* Uehling Instrument Co.

**Gages, Draft**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Bacharach Industrial Instrument Co.
- \* Bailey Meter Co.
- \* Bristol Co.
- \* Tagliabue, C. J. Mfg. Co.
- \* Taylor Instrument Cos.
- \* Uehling Instrument Co.

**Gages, Hydraulic**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Crosby Steam Gage & Valve Co.

**Gages, Liquid Level**

- \* Bristol Co.
- \* Lunkenheimer Co.
- \* Simplex Valve & Meter Co.

**Gages, Loss of Head**

- \* Builders Iron Foundry
- \* Simplex Valve & Meter Co.

**Gages, Measuring (Surface, Depth, Dial, etc.)**

- \* Norma Co. of America

**Gages, Pressure**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Bacharach Industrial Instrument Co.
- \* Bristol Co.
- \* Bailey Meter Co.
- \* Crosby Steam Gage & Valve Co.
- \* Tagliabue, C. J. Mfg. Co.
- \* Uehling Instrument Co.

**Gages, Rate of Flow**

- \* Bacharach Industrial Instrument Co.
- \* Bailey Meter Co.
- \* Builders Iron Foundry
- \* Simplex Valve & Meter Co.

**Gages, Syphon**

- \* Tagliabue, C. J. Mfg. Co.

**Gages, Vacuum**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Bacharach Industrial Instrument Co.
- \* Bristol Co.
- \* Crosby Steam Gage & Valve Co.
- \* Tagliabue, C. J. Mfg. Co.
- \* Taylor Instrument Cos.
- \* Uehling Instrument Co.

**Gages, Water**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Bristol Co.
- \* Crane Co.
- \* Jenkins Bros.
- \* Lunkenheimer Co.
- \* Reading Steel Casting Co. (Inc.)
- (Pratt & Cady Division)
- \* Simplex Valve & Meter Co.
- \* American Schaeffer & Budenberg Corp'n
- \* Bristol Co.
- \* Lunkenheimer Co.
- \* Simplex Valve & Meter Co.

**Gas Holders**

- \* Improved Equipment Co.

**Gas Plant Machinery**

- \* Cole, R. D. Mfg. Co.
- \* Improved Equipment Co.

**Gas Plants**

- \* Improved Equipment Co.

**Gas Washers**

- \* Improved Equipment Co.

**Gaskets**

- \* Goetze Gasket & Packing Co.
- \* Jenkins Bros.
- \* Johns-Manville (Inc.)
- \* Sarco Co. (Inc.)

**Gaskets, Iron, Corrugated**

- \* Smooth-On Mfg. Co.

**Gaskets, Rubber**

- \* Goodrich, B. F. Rubber Co.
- \* United States Rubber Co.

**Gates, Cut-off**

- \* Link-Belt Co.

**Gates, Sluice**

- \* Chapman Valve Mfg. Co.
- \* Phillips & Davies
- \* Pittsburgh Valve, Fdry. & Const. Co.

**Gear Cutting Machines**

- \* Jones, W. A. Fdry. & Mach. Co.

**Gear Hobbing Machines**

- \* Jones, W. A. Fdry. & Mach. Co.

**Gears, Bakelite**

- \* Ganschow, Wm. Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**Workshops.** Electric Drive for Engineering Workshops. J. Scouler. Commonwealth Engr., vol. 10, nos. 11 and 12, June 1 and July 1, 1923, pp. 408-409 and 446-451, 8 figs. Application and advantages of electric drive for operation of machine tools and other machinery employed in workshops; principles of efficient operation.

#### ELECTRIC FURNACES

**Cathode Radiation.** A Cathode Radiation Furnace (Ein Kathodenstrahlöfen), Hans Gerdien and Hans Riegger. Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 226-230, 3 figs. Consists of a ball-shaped vessel, from wall of which the cathode radiations run radially toward preparation to be heated which is located in middle of vessel.

**Electrodes.** Automatic Hydraulic Regulation of Furnace Electrodes. Electricity, vol. 37, no. 1679, Jan. 12, 1923, pp. 13-14, 1 fig. Describes hydraulic system of electrode control, developed by Brown, Boveri & Co., providing a direct-acting mechanism which requires no sensitive relays, is free from delay in operation, and has no backlash or overshooting.

**Fiat.** The New Electric Steel Furnaces at the Fiat Works in Turin. G. Vitali. Electrician, vol. 91, no. 2366, Sept. 21, 1923, pp. 305-306, 4 figs. Description of Fiat furnaces, and excellent results obtained from them. Abstract from Elektrotechnische Zeit.

**Size and Costs.** Size of Furnace Affects Costs, Larry J. Barton. Iron Trade Rev., vol. 73, no. 19, Nov. 8, 1923, pp. 1309-1310. Conditions which govern selection of size of furnace and operating costs for large and small installations based upon output; little difference is found in costs per ton.

**Tool Tempering.** Electric Furnaces in Tool Room on I. C. Ry. Elec. Engr., vol. 14, no. 10, Oct. 1923, pp. 314-315, 5 figs. Describes equipment at Burnside (Chicago) shop of Illinois Central, consisting of electric furnaces and ovens for hardening and drawing purposes; Hoskins carbon resistor furnace, return bend coil furnace made by Elec. Apparatus Co., and others.

#### ELECTRIC LOCOMOTIVES

**Baldwin - Westinghouse.** Baldwin-Westinghouse Electric Locomotives for Trunk Line Service, Paul T. Warner. Baldwin Locomotives. Baldwin Locomotives, vol. 2, no. 2, Oct. 1923, pp. 28-30, 12 figs. Describes different types of Baldwin-Westinghouse locomotives in use on different railways.

**Transmission by Connecting Rods.** New type of Transmission by Coupling Rods for Electric Locomotives. Int. Ry. Congress—Bul., vol. 5, no. 10, Oct. 1923, pp. 963-965, 2 figs. Extract of article by Joseph Bianchi published in Revue Générale des Chemins de Fer, Feb. 1923.

#### ELECTRIC MEASURING INSTRUMENTS

**Boiler Plants.** Electric Measuring Instruments in Steam Plants (Elektrische Messgeräte für Dampfbetriebe), G. Quaink. Dinglers Polytechnisches Journal, vol. 338, no. 13-14, July 14, 1923, pp. 141-145, 13 figs. Describes different types of CO and CO<sub>2</sub> indicators, thermometers, thermo elements, filament pyrometers, etc., and their application.

**Long-Distance.** New Electrical Recording System As Used in Pulp and Paper Mills, L. G. Bean. Paper Trade J., vol. 77, no. 19, Nov. 8, 1923, pp. 45-46, 2 figs. Describes instrument designed and distributed by Bristol Co., of Boston, Mass., which enables a measurement of pressure, temperature, liquid level, flow, motion or other qualities, to be made at a distance up to several miles from point at which actual condition takes place.

#### ELECTRIC WELDING, ARC

**A. C. Machine.** A Pacific Coast Alternating Current Arc Welder. West. Machy. World, vol. 14, no. 10, Oct. 1923, pp. 324-325, 5 figs. Describes a c. arc-welding equipment of simple construction and operation, developed and manufactured by Welding Service & Supply Co., San Francisco, Cal.

**Cast Iron.** Welding Cast Iron With a Special Nickel Copper Alloy Welding Wire, Alexander Churchward. Am. Welding Soc.—Jl., vol. 2, no. 9, Sept. 1923, pp. 17-19, 3 figs. Describes successful method of welding cast iron involving new principle of absorbing carbon contained in cast iron, forming thereby at juncture of weld a new alloy which not only insures strength equal to that of original casting, but also permits ready machining; accomplished without preheating, annealing or use of studs.

**Efficiency.** Efficiency of Arc Welding, R. D. Reed. Welding Engr., vol. 8, no. 10, Oct. 1923, pp. 28-29, 3 figs. Choosing machine for work; selection of electrodes and adjusting welding current.

**Steel Ship Masts.** The Manufacture of Welded Steel Masts, A. G. Bissell. Mar. News, vol. 10, no. 6, Nov. 1923, p. 76. Describes construction of fourteen steel masts for seven seagoing tugs at U. S. Navy Yard at Puget Sound, parts of which were entirely assembled by arc welding.

#### ELECTRIC WELDING, RESISTANCE

**Sheet Metal.** Resistance Welding of Sheet Metal, H. W. Tobey. Am. Welding Soc.—Jl., vol. 2, no. 9, Sept. 1923, pp. 24-28, 28 figs. Results of tests made on various forms of sheet metal.

#### ELEVATORS

**Cables.** Used, Strength of. Chart for Determining the Strength of Used Elevator Cables, C. W. Willetts. Power, vol. 58, no. 20, Nov. 13, 1923, pp. 762-764, 2 figs. Gives formula which is based on tests made on used cables and wires described in same journal (Sept. 18), and chart which was worked out to accomplish calculations that formula is intended to perform.

**Governors.** Operation of Over-Speed Governors

on Electric Elevators, Howard B. Cook. Power, vol. 58, no. 17, Oct. 23, 1923, pp. 651-652, 2 figs. Comparison of different types of elevator governors and advantages and disadvantages of each.

**Hydraulic vs. Electric.** Electric and Hydraulic Elevators in Modern Buildings, James A. McHollan. Architectural Forum, vol. 39, no. 4, Oct. 1923, pp. 169-174, 4 figs. Some of the latest improvements in electric elevator equipment, together with operating records from existing plants; comparative cost figures of electric and hydraulic elevators.

#### EMPLOYEES' REPRESENTATION

**Discipline and.** Employee Representation and Discipline, Elisha Lee. Ry. Age, vol. 75, no. 19, Nov. 10, 1923, pp. 855-857. Experience on Pennsylvania indicates that disciplinary control has been strengthened.

#### EMPLOYMENT MANAGEMENT

**Pension Costs.** Pension Costs and the Labor Turnover Factor, Joseph H. Woodward. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 483-486, 1 fig. Method of determining cost as percentage of payroll.

#### ENGINEERING

**Automobile.** Automobile Engineering as a Profession, H. G. Burford. Automobile Engr., vol. 13, no. 181, Oct. 1923, pp. 316-319. Notes on standardization; roads and their relation to transport; legislation; education and training of automobile engineer; part to be played by Institution.

#### ENGINEERS

**Achievements of.** The Rise of The Engineer, C. R. Young. Eng. J., vol. 6, no. 11, Nov. 1923, pp. 508-512. Review of what engineers have achieved; early status of engineer; growth of confidence in engineer; influence of engineering societies; profession vs. business; future of engineering.

**Relation to Public.** The Relations of the Engineer to the Public, A. N. Johnson. Univ. of Va. J. Eng., vol. 3, no. 5, Jan. 1923, pp. 93 and 102. Points out that engineers, collectively and individually, should take more active part in public affairs, in order that they may be entrusted with greater responsibility in management of public affairs.

#### ENGINEHOUSES

**Lighting.** Enginehouse Lighting on the Great Northern Ry. Elec. Engr., vol. 14, no. 10, Oct. 1923, pp. 299-300, 4 figs. Describes method of wiring enginehouses which has advantages of low first cost, overhead lights and durability; 32-volt extension circuits are a feature.

#### EXHAUST STEAM

**Total Heat, Calculation of.** Figuring the Total Heat of Exhaust Steam, A. G. Christie. Power, vol. 58, no. 18, Oct. 30, 1923, pp. 685-686, 1 fig. Methods by which total heat may be computed for turbines.

## F

#### FANS

**Air Measurement.** Air Measurement Methods for Experimental Work on Fan-Pipe Installations, G. E. McElroy and A. S. Richardson. U. S. Bur. of Mines—Reports of Investigations, no. 2527, Sept. 1923, 2 pp. Results of experiments in Butte mine to determine friction factors for different types and sizes of fan piping.

#### FEEDWATER HEATERS

**Locomotive.** A New Feed-heater for Small Locomotives. Engineer, vol. 136, no. 3537, Oct. 12, 1923, p. 404, 1 fig. Also Ry. Mech. Engr., vol. 97, no. 11, Nov. 1923, p. 749, 1 fig. Describes smokebox feed heater for new type of locomotive designed by A. Borsig, Berlin-Tegel; hot gases enter heater through circular perforated cylinder and are entrained by annular series of steam jets placed below vertical smoke tubes of heater. Abstracted from Verkehrstechnik.

#### FLIGHT

**Control at Low Speed.** Control of Aeroplanes at Low Speeds, Melvill Jones. Roy. Aeronautical Soc.—Jl., vol. 27, no. 154, Oct. 1923, pp. 473-485 and (discussion) 485-487, 3 figs. Deals with control of airplane when stalled.

**Gliding.** Gliding and Gliders at Iford. Inst. Aeronautical Engrs.—Proc., no. 5, 1923, pp. 18-23. Discussion, dealing with future form of glider, speed, aerodynamical efficiency, lessons to be learned from gliders, etc.

**Gliding Theory and the Operation of Gliders,** Alexander Klein. Aviation, vol. 15, no. 18, Oct. 29, 1923, pp. 844-849, 12 figs. Notes on gliding in still air; gliding with steady vertical and with steady horizontal currents; encountering gusts.

**Possible Use of the Microphone to Facilitate Gliding** (Sur l'emploi possible du microphone pour faciliter le vol à voile), Lafay. Académie des Sciences—Comptes Rendus des Séances, vol. 176, no. 13, Mar. 26, 1923, pp. 887-888. Suggests that a microphone suitably placed may enable a pilot to distinguish acoustically between rising and falling flight, or between rising and falling air columns, and that by using two microphones, one on each wing of a glider, it might be possible to get instantaneous indications regarding orientation of squalls met with by glider.

**Static Gliding Flight Over Flat Coasts** (Statischer Segelflug über Flachküsten), W. Georgii. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no.

13-14, July 26, 1923, pp. 114-115, 2 figs. Refers to vertical movements of air as source of energy for carrying out static gliding flight, namely, so-called forced and thermal ascending wind, and then discusses vertical movements caused by frictional changes of the air, known as frictional ascending wind.

#### FLOORS

**Composition Flooring.** Composition Flooring, Raymond R. Butler. Chem. & Industry, vol. 42, no. 41, Oct. 12, 1923, pp. 980-982. Deals with Portland cement, magnesite cements, bitumen rubber, calcium-sulphate cements, miscellaneous cements. Patent literature.

#### FLOW OF FLUIDS

**Calculation.** Simplifying the Solution of Problems of Fluid Flow, Barnett F. Dodge. Chem. & Met. Eng., vol. 29, no. 19, Nov. 5, 1923, pp. 844-846, 3 figs. Methods of calculation which eliminate procedure of trial and error heretofore in vogue.

#### FLUE-GAS ANALYSIS

**CO Meters.** At Last: A CO Meter. Fuels & Furnaces, vol. 1, no. 6, Oct. 1923, pp. 471-474, 4 figs. Describes simple electrical apparatus which gives percentage of CO almost instantly; in general, indications of combustible gases by this instrument are accurate within a few tenths of one per cent.

**CO<sub>2</sub> Meters.** An Electrical CO<sub>2</sub> Meter. Gas Age-Rec., vol. 52, no. 19, Nov. 10, 1923, pp. 587-588, 4 figs. Describes meter operating on principle different from usual chemical meter; utilizing physical property of heat conduction of gases.

#### FLYING BOATS

**Aeromarine.** Aeromarine Model AMC Commercial Flying Boat. Aviation, vol. 15, no. 18, Oct. 29, 1923, pp. 550-552, 6 figs. Features of new commercial passenger carrier based on air-line operation.

#### FLYWHEELS

**Energy Effect.** Energy Effect of a Flywheel or Rotating Mass, Robert Johnson. Machy. (Lond.), vol. 23, no. 578, Oct. 25, 1923, pp. 102-103, 4 figs. Use of chart designed by author, by means of which the "m" of wheel, or number of ft.-lb. of kinetic energy stored at 1 r.p.m., can be read off by counting number of rectangles enclosed by section of flywheel.

#### FORGING

**Locomotive Frames.** Notable Economies in Forging Locomotive Frames. Ry. Rev., vol. 73, no. 19, Nov. 10, 1923, pp. 687-689, 7 figs. Beech Grove, Ind., shops of Big Four forge front end in one piece from scrap material.

#### FOUNDRIES

**Cleaning-Room Costs.** Determining Cleaning Room Costs, B. K. Price. Abrasive Industry, vol. 4, no. 11, Nov. 1923, pp. 311-313, 4 figs. Describes cost system at plant of Lebanon Steel Foundry, Lebanon, Pa., said to be unique in steel-foundry industry; wheel performance is based on amount of material removed in pounds with total cost expressed in terms of cents per pound removed.

**Machine-Tool Castings.** Makes Machine Tool Castings, Pat Dwyer. Foundry, vol. 51, no. 21, Nov. 1, 1923, pp. 853-857, 5 figs. Describes plant and equipment of Pratt & Whitney Co., Hartford, Conn., in which molding, melting and cleaning facilities are particularly adapted to production of high-class castings.

**Overhead Carrying System.** Overhead Carrying System for Modern Foundry, F. H. Bell. Can. Foundryman, vol. 14, no. 10, Oct. 1923, pp. 13-16, 10 figs. Describes overhead system for conveying molten metal and other material in foundry; saves time and labor, increases production, and makes life easier for workmen.

**Steel.** Adopts Melting Units to Meet Varied Needs, B. K. Price. Foundry, vol. 51, no. 21, Nov. 1, 1923, pp. 868-872 and 883. Plant of Eastern Steel Castings Co., Newark, N. J., which is largest jobbing foundry in New York metropolitan district and one of few in country producing both electric and open-hearth steel castings.

#### FREIGHT HANDLING

**Containers.** Road-Railway. Interchangeable Road-Railway Containers? Motor Transport (Lond.), vol. 37, nos. 969, 970, and 975, Sept. 24, Oct. 1 and Nov. 5, 1923, pp. 384-387, 420-422, 565-566, 38 figs. Discusses question of whether goods containers or bins interchangeable between road and railway vehicles can be standardized, making calculations.

**Tractor-Trailer System.** Developing Lower Costs for Handling Freight. Ry. Age, vol. 75, no. 17, Oct. 27, 1923, pp. 757-760, 8 figs. Southern Ry. pays for tractor-trailer installation at Pinners Point, Va., out of savings produced.

**Transshipment.** The Influence of Transshipment on Railborne and Road Traffic, with Special Reference to the Most Economical Methods of Labour-Saving Appliances. Inst. Transport—Jl., vol. 4, no. 7, May 1923, pp. 228-248 and (discussion) 248-253, 15 figs. First article by J. Rostern, on influence of transshipment. Second article, by C. Bentham, on labor-saving appliances, dealing with cranes, runways, hand and power trucks, trailers, continuous conveyors weighing machines and capstans.

#### FUELS

See COAL; OIL FUEL; PEAT; PULVERIZED COAL.

#### FURNACES, HEAT-TREATING

**Hardening.** The New "Ley" Hardening Furnaces, (Der neue "Ley"-Härteofen), H. Engel. Motorwagen, vol. 26, no. 25, Sept. 10, 1923, pp. 374-376, 5 figs. Describes construction and operation of new furnace,

# Manufactured by **CLASSIFIED LIST OF MECHANICAL EQUIPMENT** Alphabetical List on page 168

- Gears, Cut**  
\* Brown, A. & F. Co.  
Chain Belt Co.  
\* De Laval Steam Turbine Co.  
Farrel Foundry & Machine Co.  
\* Fawcus Machine Co.  
\* Foote Bros. Gear & Machine Co.  
\* James, D. O. Mfg. Co.  
Johnson, Carlyle Machine Co.  
\* Jones, W. A. Fdry. & Mach. Co.  
Link-Belt Co.  
Mackintosh-Hemphill Co.  
\* Medart Co.  
Northern Engineering Works  
Philadelphia Gear Works
- Gears, Fibre**  
\* General Electric Co.  
\* James, D. O. Mfg. Co.
- Gears, Grinding**  
Farrel Foundry & Machine Co.
- Gears, Helical**  
Farrel Foundry & Machine Co.
- Gears, Herringbone**  
\* Falk Corporation  
Farrel Foundry & Machine Co.  
\* Fawcus Machine Co.
- Gears, Machine Molded**  
\* Brown, A. & F. Co.  
Farrel Foundry & Machine Co.  
\* Jones, W. A. Fdry. & Mach. Co.  
Link-Belt Co.
- Gears, Rawhide**  
Farrel Foundry & Machine Co.  
Ganschow, Wm. Co.  
\* James, D. O. Mfg. Co.  
Philadelphia Gear Works
- Gears, Speed Reduction**  
Chain Belt Co.  
\* De Laval Steam Turbine Co.  
\* Falk Corporation  
Farrel Foundry & Machine Co.  
\* Fawcus Machine Co.  
\* Foote Bros. Gear & Machine Co.  
Ganschow, Wm. Co.  
\* General Electric Co.  
\* James, D. O. Mfg. Co.  
\* Jones, W. A. Fdry. & Mach. Co.  
\* Kerr Turbine Co.  
Link-Belt Co.  
\* Sturtevant, B. F. Co.  
\* Westinghouse Electric & Mfg. Co.
- Gears, Worm**  
Chain Belt Co.  
\* Cleveland Worm & Gear Co.  
\* Fawcus Machine Co.  
\* Foote Bros. Gear & Machine Co.  
Ganschow, Wm. Co.  
\* Gifford-Wood Co.  
\* James, D. O. Mfg. Co.  
\* Jones, W. A. Fdry. & Mach. Co.  
Link-Belt Co.
- Generator Cooling Systems**  
\* Atmospheric Conditioning Corp'n
- Generating Sets**  
\* Allis-Chalmers Mfg. Co.  
\* American Blower Co.  
\* Clamage Fan Co.  
\* De Laval Steam Turbine Co.  
\* Engberg's Electric & Mech. Wks.  
\* General Electric Co.  
\* Kerr Turbine Co.  
\* Sturtevant, B. F. Co.  
\* Westinghouse Electric & Mfg. Co.
- Generators, Electric**  
\* Allis-Chalmers Mfg. Co.  
\* De Laval Steam Turbine Co.  
\* Engberg's Electric & Mech. Wks.  
\* General Electric Co.  
\* Nordberg Mfg. Co.  
Ridgway Dynamo & Engine Co.  
\* Westinghouse Electric & Mfg. Co.
- Governors, Air Compressor**  
\* Foster Engineering Co.
- Governors, Engine, Gas**

\* Bristol Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

consisting of number of muffles of different temperature requirement combined in one unit.

**Types.** A Day at the Ford Plant. W. Trinks. Fuels & Furnaces, vol. 1, no. 6, Oct. 1923, pp. 411-414, 460, 462, 464 and 466-468, 7 figs. Discusses salient features of the various types of furnaces in operation at Highland Park plant; producer gas is main fuel; describes Smith gas producers used.

## G

### GAGES

**Holes, Locating.** The Positioning of Holes for Gauge or Jig Work. E. W. Eager. Mech. World, vol. 74, nos. 1918 and 1919, Oct. 5 and 19, 1923, pp. 206-208 and 238-239, 6 figs. Describes methods for locating holes on a flat surface.

### GALVANIZING

**Anglo Process.** Anglo Process of Galvanizing. Iron & Coal Trades Rev., vol. 107, no. 2904, Oct. 26, 1923, p. 623. Hot-process methods of galvanizing; describes Anglo process, a new cold process of galvanizing iron and steel, which appears definitely to solve problem of galvanization by giving iron and steel surfaces a thoroughly efficient coating of zinc.

**Galvannealing Method.** A New Process of Coating Metals. Sheet Metal Worker, vol. 14, no. 20, Oct. 26, 1923, p. 760, 4 figs. Describes galvannealing method which gives longer protection against rust.

### GAS ENGINES

**Large.** High-Power Gas Engines (Hochleistungs-Großgasmaschinen). Ernst Immerschitt. Wärme- u. Kälte-Technik, vol. 25, nos. 20 and 21, Oct. 20 and Nov. 1, 1923, pp. 157-159 and 167-169, 9 figs. Means of increasing efficiency of large gas engines; gas engines with scavenging and auxiliary charge; design, operation and economic advantages.

**Large Gas Engines.** Practical Engr., vol. 68, nos. 1908, 1909, 1910, 1911 and 1912, Sept. 20, 27, Oct. 4, 11 and 18, 1923, pp. 157-159, 178-180, 192, 207-209 and 216-219, 13 figs. Describes various types of multi-cylinder vertical engines; producer gas for power; blast-furnace gas engines.

**Winkler-Klein.** Double Piston Two-Stroke Gas Engine. Type Winkler-Klein. Eng. Progress, vol. 4, no. 9, Sept. 1923, pp. 195-196, 2 figs. Describes engine designed by Maschinenbau A.-G. vorm. Gbr. Klein of Dahlbruch, which operates according to Körting principle, i.e., double effective two-stroke method.

### GAS PRODUCERS

**Central Type.** Performance and Grate Tests on Inclined-Retort Batteries Heated with Central-Producer Gas (Leistungs- und Unterfeuerungsversuche an fremdgasbeheizten Schrägofenbatterien). E. Schumacher. Gas- u. Wasserfach, vol. 66, no. 35, Sept. 1, 1923, pp. 524-526. Results of tests in Frankfurt gas works on two new installations of highly refractory material with gas heating supplied from a central producer plant; coke and coal analysis; advantages of central-type producers.

### GEAR CUTTING

**Bevel Gears.** Straight Bevel Gear Generator Is Designed for Mass Production. Automotive Industries, vol. 49, no. 19, Nov. 8, 1923, pp. 958-959, 1 fig. Single-purpose machine brought out by Gleason Works increases speed of manufacture.

**Hobbing Machine.** New Gear Hobbing Machine. Iron Age, vol. 112, no. 17, Oct. 25, 1923, pp. 1115-1116, 5 figs. Machine for accurate hobbing of spur and spiral gears developed by Brown & Sharpe Mfg. Co.

### GEARS

**Bevel.** Spiral Bevel Gears Which Can Be Hobbed. Nikola Trojevič. Am. Mach., vol. 59, no. 18, Nov. 1, 1923, pp. 647-652, 8 figs. New theory of bevel gearing; how tapered hob can be employed; method of determining action of gearing.

### GRINDING

**Cylindrical Production.** Development in Production Grinding in the Automotive Industry. Oscar A. Knight. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 387-392, 15 figs. Details of new attachments, mechanisms and grinding machines; author points out importance of quality product to serve needs of automotive industry adequately.

**Dust Inhalation.** Grinding Processes and Dust Inhalation. E. L. Macklin and E. L. Middleton. Quarry & Surveyors' & Contractors' Jl., vol. 28, no. 319, Sept. 1923, pp. 248-250. Abstract of report on grinding of metals and cleaning of castings with special reference to effects of dust inhalation upon workers, issued by Brit. Home Office.

**Steel Castings.** Steel Casting Grinding Practice. Herbert R. Simonds. Abrasive Industry, vol. 4, no. 11, Nov. 1923, pp. 318-320, 4 figs. Selection of wheels; use of goggles and wheel guards; correct wheel speeds essential.

### GRINDING MACHINES

**Spur-Gear.** Spur-Gear Grinding and Testing. A. J. Ott and C. L. Ott. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 401-406, 19 figs. Grinding machine for finishing spur gears which, it is claimed, will grind transmission gears on production bases after they have been heat treated, will produce correct tooth contour, smooth finish, and accurate tooth spacing; also describes machine for testing gears that have been ground.

## H

### HACK-SAWING MACHINES

**Developments.** Developments in Power Hacksaw Blades and Machines. Machy. (Lond.), vol. 23, no. 577, Oct. 18, 1923, pp. 65-69, 9 figs. Describes new type of saw blade with specially set tooth patented by A. H. Evans; sharpening machine for reconditioning blades, and sawing machine suitably adapted to run at high speeds under more severe conditions required to obtain maximum advantages from new blades.

### HANDLING MATERIALS

**Foundries.** A Cost Comparison in Handling Materials. Shellman B. Brown. Management & Administration, vol. 6, no. 5, Nov. 1923, pp. 611-616, 6 figs. Mechanical equipment contrasted with hand labor at Warren Foundry & Pipe Co.

### HANGARS

**German System.** Modern Airplane Hangars (Neuzeitliche Hallen für Flugzeuge). H. Sattler. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no. 15-16, Aug. 31, 1923, pp. 127-128, 2 figs. Describes new construction system with wooden segment roof, developed in Germany.

### HARDNESS

**Ball Hardness Testing.** Brinell Hardness Tests. Practical Engr., vol. 68, nos. 1909 and 1910, Sept. 27 and Oct. 4, 1923, pp. 175-176 and 185-187, 3 figs. Ball-indentation principle of comparing hardness of metals. Formulas and calculations.

**Scleroscope.** Application of. The Standardization of Methods of Applying the Scleroscope. A. F. Shore. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 409-416, 16 figs. Statement of nine items suggested by Iron and Steel Division of Society for consideration with reference to securing greater uniformity in practice when making precision hardness tests with scleroscope; comparison between Brinell and scleroscope hardness testing.

**Testers.** Hardness Tester on the Rebound Principle. H. Degen. Eng. Progress, vol. 4, no. 9, Sept. 1923, pp. 193-195, 7 figs. Design and performance; Shore's hardness index; examples of application of hardness tester on rebound principle.

### HEAT

**Conservation.** Practical Work in the Field of Heat Conservation (Praktische Arbeit auf dem Gebiete der Wärmewirtschaft). H. Reutlinger. Archiv für Wärmewirtschaft, vol. 4, no. 10, Oct. 1923, pp. 181-187, 8 figs. Notes on waste-steam utilization in a textile and in a paper mill; heat-economical improvements in a dye factory; improvement in production machines; reconstruction of hot-air plant in a dye factory; waste heat utilization in a large ceramic plant.

### HEAT TRANSMISSION

**Cylinders.** Heat Migration in Cylinders from Homogeneous Heat Conductors (Wärmewanderung in Zylindern aus homogenen Wärmeleitern). Ernst Oelschläger. Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 29-40, 5 figs. Describes approximate method for calculation of temperature in relation to time, in long cylindrical bodies, when these are heated internally or externally.

### HEATING, ELECTRIC

**Dwellings.** Facts About Electric Heating. M. P. Whelen. Elec. News, vol. 32, no. 18, Sept. 15, 1923, pp. 78-80, 3 figs. Results of special research on application of electrical heating systems to dwellings; sizes of units; energy required; cost of installation; limiting factors.

### HEATING, GAS

**Experiments.** The Denver Residence Gas-Heating Experiment. T. M. Foulk and T. G. Storey. Heat & Vent. Mag., vol. 20, no. 10, Oct. 1923, pp. 37-43, 11 figs. Detailed report of conditions under which this program, inaugurated by Denver Gas & Elec. Light Co., is being conducted, methods and experience relative to installations, and economic results obtained.

**Industrial.** Industrial Gas Heating (Ausgewählte Kapitel aus dem Gebiete der gewerblichen Gasfeuer), H. Albrecht. Gas- u. Wasserfach, vol. 66, no. 24, June 16, 1923, pp. 346-353, 9 figs. Deals with following problems: Fixing price of gas to compete with price of coal firing; low-pressure gas, compressed air, and compressed gas; removal of exhaust gases; heat losses, their prevention and recovery.

### HEATING, STEAM

**Central-Station.** Analysis of Some Central Station Heating Plant Problems. Mun. & Country Eng., vol. 65, no. 3, Sept. 1923, pp. 101-107. Growth of central-station heating; advantages to consumer; advantages of steam; factors affecting success; location of plant relative to water and coal supply; design and equipment of plant; data on Minnesota plants.

The New Central Heating Plant of Queen's University and Kingston General Hospital. L. M. Arkley and W. P. Wilgar. Eng. Jl., vol. 6, no. 11, Nov. 1923, pp. 475-483, 12 figs. Design and equipment of plant in which existing equipment was used wherever practicable.

**Community or Group.** Facts and Figures on Community or Group Heating. H. C. Kimbrough. Mun. & Country Eng., vol. 65, no. 4, Oct. 1923, pp. 146-148. Investigation of engineering and commercial factors. Data on cost of construction and operation of single unit, or block plant, consisting of 42 residences, 4 apartment buildings, 1 club and 9 garages.

**Counterflowing Condensate.** Critical Velocity of Steam with Counter-Flowing Condensate, William

A. Pearl and Eri B. Parker. Heat & Vent. Mag., vol. 20, no. 10, Oct. 1923, pp. 46-49, 3 figs. Practical data secured through recent tests for solving problems where flow of condensation is counter to steam flow. From Eng. Bul. No. 13 issued by State College of Wash. Experiment Station.

### HOBBS

**Gear-Cutting.** Making Hobbs for Cutting the Teeth of Gears. Ellsworth Sheldon. Am. Mach., vol. 59, no. 17, Oct. 25, 1923, pp. 623-627, 10 figs. Describes manufacturing operations involved.

### HYDRAULIC TURBINES

**Draft Tubes.** Comparative Tests on Experimental Draft-Tubes. C. M. Allen and I. A. Winter. Am. Soc. Civ. Engrs.—Proc., vol. 49, no. 9, Nov. 1923, pp. 1813-1845, 29 figs. Results of tests made at Alden Hydraulic Laboratory on 12 model draft tubes, to determine relative efficiencies of draft tubes of different types under hydraulic conditions existing at 120,000-hp. hydroelectric power plant under construction.

**Economic Operation.** Economical Operation of Hydraulic Turbines. Amory R. Haynes. Elec. Light & Power, vol. 1, no. 10, Oct. 1923, pp. 19-21, 50-52 and 54-55, 6 figs. Discussion of economical use of water in a station, and features of system operation affecting best internal economy; test data.

**Flume Calculation.** Hydraulic Calculation of Flumes (Hydraulisk beräkning av flötningsrännor). Fredrick Jonsson. Teknisk Tidskrift, vol. 53, no. 17, Apr. 28, 1923, pp. (Vägoch Vattenbyggnadskonst) 37-41, 4 figs. Formulas and calculations for flumes of turbines of hydroelectric plants, and examples of application.

**Kaplan High-Speed.** European Development in High-Speed Hydraulic Turbines. Elov Englesson. Power, vol. 58, no. 20, Nov. 13, 1923, pp. 758-760, 10 figs. Kaplan-type turbines designed with movable blades to be adjusted for different load conditions, which improve part-load efficiencies; 11,200-hp. turbine of this type under construction in Sweden to operate under 21.25 ft. head and run at 62.5 r.p.m.; runner is 19 ft. in diam. and weighs 62.5 tons.

**Racing.** Protection Against the Racing of Hydraulic Turbines (Schutz gegen das Durchgehen von Wasserturbinen). C. Reindl. Elektrotechnik u. Maschinenbau, vol. 41, nos. 39 and 40, Sept. 30 and Oct. 7, 1923, pp. 566-571 and 582-586, 10 figs. Investigation of influence of different protective arrangements, influence of flywheel moment, and water content of turbine chamber and pipe line on increase in speed.

**Reaction in.** A Study of Irregularity of Reaction in Francis Turbines. Roy Wilkins. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1141-1144, 14 figs. Describes successful method of study of such phenomena as vibration caused by irregularity of reaction manifesting itself in several impulses per second.

### HYDROELECTRIC DEVELOPMENTS

**Augusta, Ga., Project.** Proposed Electrification of the Augusta, Georgia, Power Canal. Nisbet Wingfield. Mun. & County Eng., vol. 65, no. 3, Sept. 1923, pp. 121-126. Present sources of power; how additional power can be obtained; possible sites for hydroelectric development; proposed development.

**Sweden.** Water-Power Development in Sweden. W. Borgquist. Elec. World, vol. 82, no. 17, Oct. 27, 1923, pp. 850-855, 11 figs. Far-flung system of low-head plants extending to Arctic circle is fast being interconnected into one great group; how hydroelectricity is supplemented by steam.

### HYDROELECTRIC PLANTS

**California.** Recent Hydroelectric Developments of Southern California Edison Company. H. L. Doolittle. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1132-1133. Details of Kern River and Big Creek power plants; installation of venturi meters; draft tubes; impulse wheels; and rubber seal rings.

**Canada.** Hydro Development at Chute Des Galets, Hector Cimon. Can. Engr., vol. 45, no. 14, Oct. 2, 1923, pp. 361-362, 4 figs. Describes hydroelectric plant on Shipshaw river built to supply power to paper mill at Kenogami, Que.; concrete dam and power house; two vertical turbines direct-connected to 8000-kva. generators.

**Washington.** Upper Falls Development of The Washington Water Power Company in Spokane, Wash. L. J. Pospisil. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 11, Nov. 1923, pp. 1133-1140, 6 figs. Describes hydroelectric development in center of city having single vertical-shaft generator and delivering its output to buses of existing distribution substation 350 ft. distant, excitation and load control of new generator being from substation.

### ICE MANUFACTURE

**Methods.** New Ice Making System. H. T. Simpson. Ice & Refrigeration, vol. 65, no. 4, Oct. 1923, pp. 180-182, 4 figs. Describes ice-making equipment of Fox Ice Co., Racine, Wis.; method of harvesting ice; methods of filling cans; treatment of crushed ice in cores.

### ICE PLANTS

**Electrically Operated.** Electrically Driven Ice-Making Plant. Ice & Cold Storage, vol. 26, no. 306, Sept. 1923, pp. 211-212, 4 figs. Details of installation consisting of two separate and independent units, each capable of producing 75 tons of ice per day.

**Pittsburgh, Pa.** Modern Plant of the North Pole Ice Co., Pittsburgh, Pa. Refrigeration, vol. 33, no. 7,

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

Aug. 1923, pp. 38-43, 8 figs. Cold-storage warehouse contains cooled space of about 2,000,000 cu. ft.; ice-making system has capacity of 320 tons per day; ice-storage rooms have capacity of 20,000 tons ice.

**Spray Cooling Equipment.** Spray Cooling Equipment for Ice Plants, B. R. Sausen. Refrig. Eng., vol. 10, no. 3, Sept. 1923, pp. 94-95 and (discussion) 95-96. Type, design, size and arrangement of nozzle; type of spray; type and function of louver; etc. This method has low initial and operating cost, practically no maintenance cost and satisfactory cooling effect.

#### IGNITION

**Automobile Engines.** Ignition Appliances. Auto-car, vol. 51, no. 1401, Oct. 19, 1923, pp. 692b-694. 7 figs. Review of magneto and coil ignition sets now in wide use.

#### INDUSTRIAL MANAGEMENT

**Budgetary Control.** The Monthly Financial Budget, Joseph H. Barber. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 453-457, 1 fig. Budgetary procedure adopted by Walworth Mfg. Co.

**Control System.** The "Tell-Tale" Control Board, Chester B. Lord. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 467-472, 7 figs. Describes simple self-contained, kinetic chart capable of indicating simultaneously any or all factors of industrial operation in terms of common denominator, and of indicating selective responsibility in measure that condition of any item demands.

Posting and Using the "Tell-Tale" Control Board, Chester B. Lord. Management & Administration, vol. 6, no. 5, Nov. 1923, pp. 617-621, 3 figs. Shows how facts are posted on control board and how tell-tale indications bring action.

**Cost Control.** Interpreting Operation to the Directors, Geoffrey C. Brown. Management & Administration, vol. 6, no. 6, Nov. 1923, pp. 593-598, 6 figs. Describes methods employed in New York mirror factory for purpose of presenting data in such a way that picture of month's activity is constantly before management, and easily accessible to board of directors; tables and graphs prepared by planning office in closing the month.

**Employee Suggestion System.** Workable Employee Suggestion System, L. W. Tomlin. Iron Age, vol. 112, no. 20, Nov. 15, 1923, pp. 1315-1316. Example of system which after two years of operation is still marked by active employee participation, with gratifying results to management.

**Financial Control.** Finance and Common Sense, C. L. Eiermann. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 487-490. Practical suggestions for proper handling of financial matters, emphasizing particularly necessity of coordinating financial program with sales and production programs.

**Planning System.** A Workable Planning System for the Moderate Sized Plant, A. F. Erickson. Factory, vol. 31, no. 5, Nov. 1923, pp. 611-612, 4 figs. Basis of system is large planning board provided with horizontal angle pockets for each machine; planning slip used in connection with board is ruled along one side to indicate hours and fractions of hours.

#### INDUSTRIAL ORGANIZATION

**Vertical Combination.** The "Vertical Combination" and How It Reduces Distribution Costs, William R. Basset and Johnson Heywood. Indus. Management (N. Y.), vol. 66, no. 5, Nov. 1923, pp. 278-280, 1 fig. Shows why vertical combination—a combination of links in chain from raw material to distributed product—is inevitable development of near future, and outlines possibilities of such combinations.

#### INDUSTRIAL PLANTS

**General Electric Co., Schenectady.** Extreme Variety Versus Standardization, John H. Van Deventer. Indus. Management (N. Y.), vol. 66, no. 5, Nov. 1923, pp. 253-264, 19 figs. partly on supp. plate. Production problems of Gen. Elec. Co. The Schenectady works.

#### INDUSTRIAL TRUCKS

**Electric Lift.** New Low Type Electric Lift Truck. Pac. Mar. Rev., vol. 20, no. 11, Nov. 1923, p. 529. Truck developed by L. I. Parker Elec. Co., with power lift which may be used with same platforms as ordinary hand-lift truck.

#### INTERNAL-COMBUSTION ENGINES

**British Types.** The Shipping, Engineering and Machinery Exhibition. Automobile Engr., vol. 13, no. 181, Oct. 1923, pp. 308-315, 20 figs. Description of British internal-combustion-engine section.

**Friction Losses.** Influence of Speed and Temperature on Friction Losses in Internal-Combustion Engines (Influence de la vitesse et de la température sur les pertes par frottements dans les moteurs à explosions), Andre Planiol. Académie des Sciences—Comptes Rendus des Séances, vol. 176, no. 16, Apr. 16, 1923, pp. 1044-1047, 2 figs. Results and deductions from experiments made on a single-cylinder 4-stroke gas engine, 30 hp., 200 r.p.m., 290-mm. bore, 430-mm. stroke, on town gas with volumetric compression 7.0.

**Heat Transmission in.** Heat Transmission in Internal-Combustion Engines (Der Wärmeübergang in der Verbrennungskraftmaschine), Wilhelm Nusselt. Zeit. des Vereines deutscher Ingenieure, vol. 67, nos. 28 and 29, July 14 and 21, pp. 692-695 and 708-711, 6 figs. Study of cooling of hot combustion gases, based on explosion tests in spherical bombs; formulas for heat-transmission coefficients; equation for calculation of heat exchange between gas and wall in internal combustion engine.

[See also AIRPLANE ENGINES; AUTOMOBILE ENGINES; DIESEL ENGINES; GAS ENGINES; OIL ENGINES; SEMI-DIESEL ENGINES.]

#### IRON CASTINGS

**Separation under Solidification.** Separation Phenomena in Castings (Entmischungsercheinungen an Gussstücken), Reinh. Kühnel. Giesserei-Zeitung, vol. 20, no. 21, Oct. 1, 1923, pp. 407-411, 6 figs. Mixture of layers; mixture of zones; causes of zone separation; influence of contraction; practical examples; experimental results.

#### IRON FOUNDRY

**Casting-On to Metal.** Casting-On to Metal, etc., in Foundry Work, Walter J. May. English Mechanics & World of Sci., vol. 118, no. 3056, Oct. 19 1923, pp. 162-163, 4 figs. Informative account of modern foundry methods.

#### IRON, PIG

**Mixers.** Temperature Changes in Thomas Pig Iron on the Way from Blast Furnace to Converter (Die Temperaturveränderungen des Thomasroheisens auf dem Wege von Hochofen zur Birne), E. Seitzler. Stahl u. Eisen, vol. 43, no. 42, Oct. 18, 1923, pp. 1315-1321 and (discussion) 1321-1322, 6 figs. Describes mixer plant in steel works at Rheinhausen, Germany; temperature losses of pig iron for blast-furnace tapping to converter; reduction of heat losses of mixer through insulation; tests with one-mixer and two-mixer practice and results.

## L

#### LABOR

**Wages and Hours.** Wages and Hours of Labor. Monthly Labor Rev., vol. 17, no. 4, Oct. 1923, pp. 59-69. Wages and hours of labor in foundries and machine shops, 1923; schedule of wages for civil employees under naval establishment; English factory hours and two-shift system for women, etc.

#### LABORATORIES

**Foundry.** Designing and Equipping a Foundry Laboratory, H. H. Shepherd. Foundry Trade J., vol. 28, nos. 373, 374 and 375, Oct. 11, 18 and 25, 1923, pp. 305-307, 334-337 and 352-353, 16 figs. Status of laboratory; site; building; furnishing; balance room; chemical laboratory; titrating bench; fume cupboards; physical laboratory; microscope and dark room; bench considerations; lighting, heating and ventilation; estimated cost.

#### LADLES

**Geared.** Geared Crane Foundry Ladles, M. Wise. Mech. World, vol. 74, no. 1922, Nov. 2, 1923, pp. 276-277, 6 figs. Details of design.

#### LATHES

**Relieving.** Machine for Backing Off Straight and Spirally Grooved Cutting Tools (Maschine zum Hinterdrehen von gerade- und spiralgenuteten Schneidwerkzeugen), G. Luppberger. Werkstattstechnik, vol. 17, no. 18, Sept. 15, 1923, pp. 549-553, 7 figs. Describes universal relieving lathe which can also be used for grinding worms and threads, and as an ordinary lathe.

**Turret.** Modern Turret Lathe Refinements, E. W. Field. British Machine Tool Eng., vol. 2, no. 23, Sept.-Oct. 1923, pp. 688-691 and 712, 6 figs. Describes developments.

#### LIGHTING

**Progress 1922-1923.** The Year's Progress in Illumination 1922-1923. Illuminating Eng. Soc.—Trans., vol. 18, no. 7, Sept. 1923, pp. 583-678. Report of committee on progress. Deals with gas, incandescent electric lamps, arc and vapor tube lamps, lamps for projection purposes, street lighting and other exterior illumination, interior illumination, luminaires, photometry, physics, physiology, illuminating engineering. Bibliography.

**Railway.** Report of Committee (Assn. Ry. Elec. Engrs.) on Illumination. Ry. Elec. Engr., vol. 14, no. 11, Nov. 1923, pp. 361-367, 5 figs. Review of development in incandescent lamp and illumination fields that are of interest to railway electrical engineers; changes in industrial lighting codes; diversity of opinion as to how flood lighting should be applied.

#### LOCOMOTIVES

**Austrian.** Austrian Steam Locomotives (Die österreichischen Dampflokomotiven), H. Baeker. Glaser's Annalen, vol. 92, nos. 4, 10 and 11, Feb. 15, May 15 and June 1, 1923, pp. 55-60, 139-143 and 147-151, 15 figs. Feb. 15: Locomotives with 4 and 5 coupled axles. May 15: Locomotives with 6 coupled axles; freight locomotives. June 1: Tender locomotives and tenders.

**Cab Signals.** Locomotive Cab Signals. Int. Ry. Congress Assn.—Bul., vol. 5, no. 6, June 1923, pp. 590-616. Account of discussion dealing with repeating and recording track signals on locomotive, different systems already used or tried, results obtained, and recording running speed of locomotives.

**Diesel-Engined.** A New Diesel Locomotive, Georg Held and M. Kuljinski. Verkehrstechnik, vol. 40, no. 40, Oct. 5, 1923, pp. 361-363. Disadvantages of present-day steam locomotives and advantages of Diesel locomotives are pointed out; design of new Diesel locomotive and its useful possibilities.

How the Sulzer-Diesel Locomotive Operated. Oil Engine Power, vol. 1, nos. 7 and 8, July and Aug., 1923, pp. 337-339 and 401-406, 7 figs. Detailed description of Diesel engine which developed over 1600 b.h.p. in a locomotive that weighed 95 tons and which represented greatest departure ever made from standard Diesel practice.

**Electric.** See ELECTRIC LOCOMOTIVES.

**Half-Stroke Cut-off.** Possibilities of Half Stroke Cut-off Locomotive, W. P. Kiesel, Jr. Ry. Age, vol. 75, no. 20, Nov. 17, 1923, pp. 903-906, 3 figs. Advantages of compound and three-cylinder types combined with simplicity of two-cylinder type. (Abstract.) Paper read before New York R. R. Club.

**Headlights.** Report of Committee (Assn. Ry. Elec. Engrs.) on Locomotive Headlights. Ry. Elec. Engr., vol. 14, no. 11, Nov. 1923, pp. 354-359, 4 figs. Status of marker and classification lights with regard to operating rules; photometry tests for headlight reflectors recommended.

**Heat Economy in.** Heat Economy in Steam Locomotives (Wärmewirtschaft bei Dampflokomotiven), L. Schneider. Archiv für Wärmewirtschaft, vol. 4, no. 8, Aug. 1923, pp. 145-149, 9 figs. Notes on firing, boiler, preheater, superheater, engine and valve gear, etc.

**Internal-Combustion.** Crude Oil Motor Locomotive. Engineering, vol. 116, no. 3018, Nov. 2, 1923, pp. 553-554, 12 figs. partly on p. 555. Details of locomotive built by Swedish firm; engine is 2-cylinder 2-cycle machine with crankcase compression, provided with hot-bulb ignition, and centrifugal governor controlling fuel pump.

**Internal-Combustion Locomotives.** Ry. Gaz., vol. 39, no. 18, Nov. 2, 1923, pp. 558-560, 3 figs. Discussion of the various phases of the subject; discusses the four classes.

**Lubricated Area.** A New Language for the Steam Locomotive. Ry. & Locomotive Eng., vol. 36, no. 11, Nov. 1923, pp. 346-348, 3 figs. Sets forth wide range of difference in lubricated areas between engines in same class of service.

**Mikado.** Mikado Locomotives for the Lehigh Valley. Ry. Mech. Engr., vol. 97, no. 11, Nov. 1923, pp. 739-742, 12 figs. Heavy freight engines for anthracite road burn soft coal; booster increases tonnage capacity.

**Pacific Type.** Pacific Type Locomotives, Canadian Pacific Railway. Can. Ry. & Mar. World, no. 309, Nov. 1923, pp. 513-516, 9 figs. Latest type has boilers of more than 100-per cent capacity in relation to cylinder requirements; built by Montreal Locomotive Works.

**Passenger.** Four-Cylinder 4-6-0 Type Locomotive of the Great Western Railway—England. Ry. & Locomotive Eng., vol. 36, no. 11, Nov. 1923, pp. 341-342, 3 figs. Tractive effort of 31,626 lb. is greater than any other British passenger locomotive.

**Pennsylvania Ten-Wheel Passenger Locomotive.** Ry. Age, vol. 75, no. 19, Nov. 10, 1923, pp. 859-860, 4 figs. New design for local passenger service with 68-in. drivers, develops 41,325-lb. tractive force. See also Ry. & Locomotive Eng., vol. 36, no. 11, Nov. 1923, pp. 337-340, 7 figs.

**Suggested Design for a 4,000 h.p. Passenger Locomotive.** H. A. F. Campbell. Ry. Age, vol. 75, no. 16, Oct. 20, 1923, pp. 707-708, 1 fig. Writer proposes 3-cylinder compound, superheater 2-8-4 type, tender locomotive.

**Standardization.** Standardization in Locomotive Construction (Normalisierung im Lokomotivbau und Typisierung der Kleinbahnlokomotiven), H. Najork. Verkehrstechnik, vol. 40, no. 36, Sept. 7, 1923, pp. 316-324, 12 figs. Discusses standards and work of Locomotive Standard Committee in standardization of construction parts, reduction of narrow-gauge locomotive types through standardization, and interchangeability of parts.

**Steam-Turbine.** Ramsay Turbo-Electric Condensing Engine. Ry. Mech. Engr., vol. 97, no. 11, Nov. 1923, pp. 746-749, 6 figs. Experimental locomotive developed by Armstrong, Whitworth & Co.; details of latest modified design; results of tests.

**Tank.** New 0-8-4 Type Superheated Tank Locomotives, London Midland & Scottish Railway. Ry. Gaz., vol. 39, no. 18, Nov. 2, 1923, p. 551, 2 figs. Notes on locomotive designed and built at Crewe Works for operating mineral and local passenger trains on heavy gradients in South Wales; tests made.

**New 2-6-4 Tank Engines for Local Service.** Buenos Ayres Great Southern Railway. Ry. Gaz., vol. 39, no. 18, Nov. 2, 1923, p. 552, 2 figs. Notes on new type of engine recently put into service; three-cylinder simple, fitted with superheaters; working pressure 200 lb. per sq. in.

**Three-Cylinder.** New York Central Three-Cylinder Locomotive. Ry. Mech. Engr., vol. 97, no. 11, Nov. 1923, pp. 743-744, 1 fig., also Ry. Age, vol. 75, no. 18, Nov. 3, 1923, pp. 821-822, 1 fig. 4-8-2 type for freight service, with booster, develops 75,700 lb. tractive force; adhesion factor 3.73.

**Wheel Guidance in Track.** The Guidance and Running of Locomotive Wheels on the Track (Führung und Lauf des Lokomotivrades im Geleise), J. Buchli. Schweizerische Bauzeitung, vol. 82, no. 10, Sept. 8, 1923, pp. 119-125, 14 figs. Results of model tests for investigation of lateral holding power of a wheel on rail under widely differing operating conditions.

#### LUBRICANTS

**Cutting Tools.** Tool Engineering, Albert A. Dowd and Frank W. Curtis. Am. Mach., vol. 59, no. 17, Oct. 25, 1923, pp. 613-615, 1 fig. Cutting lubricants and their application; principles of coolants; suitability to material being cut; factors such as power consumption and removal of chips.

#### LUBRICATING OILS

**Reclamation of.** Reclaiming Power Plant Lubricants, Allen F. Brewer. Elec. Light & Power, vol. 1, no. 10, Oct. 1923, pp. 13-16 and 64-65, 8 figs. Describes methods of purification and reclamation systems.

**Storage and Handling.** Lubricating Oil Storage

# Manufactured by **CLASSIFIED LIST OF MECHANICAL EQUIPMENT** Alphabetical List on page 168

- Paper Mill Machinery**  
Farrel Foundry & Machine Co.
- Paper, Sensitized**  
Dietzgen, Eugene Co.  
Keuffel & Esser Co.  
ParVell Laboratories  
Weber, F. Co. (Inc.)
- Paraffine Wax Plant Equipment**  
Kellogg, M. W. Co.  
\* Vogt, Henry Machine Co.
- Pasteurizers**  
\* Vilter Mfg. Co.
- Pattern Mfg.**  
\* American Machine & Foundry Co.  
DuPont Engineering Co.
- Pencils, Drawing**  
American Lead Pencil Co.  
Dietzgen, Eugene Co.  
\* Dixon, Joseph Crucible Co.  
Keuffel & Esser Co.  
ParVell Laboratories  
Weber, F. Co. (Inc.)
- Penstocks**  
Kellogg, M. W. Co.  
Smith, S. Morgan Co.
- Pile Drivers**  
Clyde Iron Works Sales Co.  
Lidgerwood Mfg. Co.
- Pin Making Machines**  
Baird Machine Co.
- Pinions, Rolling Mill**  
Mackintosh-Hemphill Co.
- Pinions, Steel**  
\* General Electric Co.
- Pipe, Cast Iron**  
\* Builders Iron Foundry  
\* Central Foundry Co.  
\* U. S. Cast Iron Pipe & Fdry. Co.
- Pipe, Riveted**  
\* American Spiral Pipe Wks.  
\* Springfield Boiler Co.  
\* Titusville Iron Works Co.  
\* Walsh & Veidner Boiler Co.
- Pipe, Soil**  
\* Central Foundry Co.
- Pipe, Steel**  
\* Crane Co.
- Pipe, Welded**  
\* American Spiral Pipe Wks.  
\* Crane Co.  
\* Pittsburgh Valve, Fdry. & Const. Co.
- Pipe, Wrought Iron**  
Byers, A. M. Company  
\* Crane Co.
- Pipe Coils, Covering, Fittings, etc.**  
(See Coils, Covering, Fittings, etc., Pipe)
- Pipe Cutting-off Machines**  
\* Curtis & Curtis Co.
- Pipe Cutting and Threading Machines**  
\* Crane Co.  
\* Curtis & Curtis Co.  
\* Landis Machine Co. (Inc.)
- Pipe Threading Machines**  
Treadwell Engineering Co.
- Piping, Ammonia**  
\* Frick Co. (Inc.)
- Piping, Power**  
\* Crane Co.  
Kellogg, M. W. Co.  
\* Pittsburgh Valve, Fdry. & Const. Co.  
\* Vogt, Henry Machine Co.
- Pitot Tubes**  
(See Tubes, Pitot)
- Planimeters**  
\* American Schaeffer & Budenberg Corp'n  
\* Bristol Co.  
\* Crosby Steam Gage & Valve Co.  
Dietzgen, Eugene Co.  
Keuffel & Esser Co.  
ParVell Laboratories  
Weber, F. Co. (Inc.)
- Plate Metal Work**  
(See Steel Plate Construction)
- Platinum**  
Wilson, H. A. Co.
- Pointers, Bolt**  
\* Landis Machine Co. (Inc.)
- Polishing Machinery**  
\* Builders Iron Foundry  
\* Royersford Fdry. & Mach. Co.
- Powdered Fuel Equipment (for Boiler and Metallurgical Furnaces)**  
\* Allis-Chalmers Mfg. Co.  
\* Combustion Engineering Corp'n  
\* Fuller-Lehigh Co.  
\* Quigley Furnace Specialties Co.
- \* Smith, F. L. & Co.  
\* Worthington Pump & Machinery Corp'n

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

and Handling Methods, Allen F. Brewer. Elec. Light & Power, vol. 1, no. 9, Sept. 1923, pp. 13-16, 76-77 and 79, 7 figs. Deals with type of shipping container that is to be handled, construction of oil house, equipment installed for handling shipping containers, storage tanks and their appurtenances, manner of delivery to the various parts of plant, and means for measuring oil so delivered.

#### LUBRICATION

**Power Plants.** What the Lubrication Engineer Has Done for Power Plant Maintenance, Allen F. Brewer. Indus. Management (N. Y.), vol. 66, no. 5, Nov. 1923, pp. 281-289, 10 figs. Discusses various lubricants and their characteristics, and shows how modern science of lubrication makes it possible to keep it under control.

## M

#### MACHINE SHOPS

**Equipment, Arrangement of.** An example of Systematized Production, Fred R. Daniels. Machy. (N. Y.), vol. 30, no. 3, Nov. 1923, pp. 189-193, 8 figs. Arrangement of equipment used in producing predetermined quantity of work in given time; installed by Taft-Peirce Mfg. Co., Woonsocket, R. I. in department where gasoline savers for Ford carburetors are made.

#### MACHINE TOOLS

**Refrigerating Machinery Manufacture.** Manufacturing Refrigerating Machinery in a San Francisco Plant. West. Machy. World, vol. 14, no. 10, Oct. 1923, pp. 317-319, 8 figs. Some of the machine-tool equipment used at Cyclops Iron Works, manufacturers of ice and refrigerating equipment.

#### MAGNESIUM

**Foundry Uses.** Magnesium in the Foundry, H. J. Maybrey. Metal Industry (London), vol. 23, nos. 14 and 15, Oct. 5 and 12, 1923, pp. 292, and 315-318, 4 figs. Uses of magnesium; objection to chloride flux; procedure of magnesium melting and pouring; casting in chill molds; casting in sand molds; affinity for water; molding sand; casting design.

#### MARINE ENGINES

**Double-Compound Reciprocating.** The Double-Compound Reciprocating Engine of the Steamer Bilbao (Die Doppelverbund-Kolbenmaschine des Dampfers "Bilbao"), J. Eggers. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 43, Oct. 27, 1923, pp. 1008-1010, 5 figs. Describes new type of double-compound engine and practical results obtained.

#### MARINE STEAM TURBINES

**German Construction.** Marine Turbines of the German General Electric Co., Berlin (Der Schiffsturbinebau der AEG-Berlin), E. A. Kraft. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 43, Oct. 27, 1923, pp. 1002-1007, 25 figs. Describes turbines, transmission gear, thrust bearings and condensers constructed by A. E. G.

#### MEASURING INSTRUMENTS

**Out-of-Roundness Measurement.** Factors Governing "Out-of-Roundness" Measurement, A. H. Frauenthal. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 370-374, 7 figs. Types of out-of-roundness and those peculiar to certain machines; three-point measuring system; errors of V-block method; use of V-block for elliptical objects; other methods of checking elliptical forms and indicator-reading correction; three items for instrument improvement are suggested.

#### METALS

**Cleaning.** Metal Cleaning, F. H. Guernsey. Machy. (N. Y.), vol. 30, no. 3, Nov. 1923, pp. 185-186. Deals with factors involved in effective cleaning, namely, condition of water, type of equipment, temperature of cleaner, and time allowed for cleaning.

**Cold Working.** The Cold Working of Metals, Machy. (London), vol. 23, no. 575, Oct. 4, 1923, pp. 17-20, 5 figs. Relative effects of cold and hot working; bright drawn steel bar; cold-drawn tubing; wire drawing; cold-working effects on non-ferrous metals.

**Internal Strains.** The Heyn Theory of the Stiffening of Metals Due to Hidden Elastic Stresses (Zur Heyn'schen Theorie der Verfestigung der Metalle durch verborgene elastische Spannungen), Georg Masching. Wissenschaftliche Veröffentlichungen aus dem Siemens-Konzern, vol. 3, no. 1, May 15, 1923, pp. 231-239, 4 figs. Confirmation of Heyn's theory that stiffening phenomena are partially due to internal strains.

**Overstrain.** Overstrain in Metals, Joseph Kaye Wood. Am. Inst. Min. & Met. Engrs.—Trans., no. 1278-S, Nov. 1923, 13 pp., 12 figs.; also (abstract) in Min. & Metallurgy, vol. 4, no. 203, Nov. 1923, pp. 575-577, 1 fig. Overstrain depends on partial elastic action occurring above elastic limit; amount depends on amount of "hyper" elastic energy expended, which energy corresponds to partial elastic action; this energy depends furthermore on elastic and plastic constants of metal; with aid of these principles shape of stress-strain diagram is explained.

**Testing, Value of Energy Relation in.** The Value of the Energy Relation in the Testing of Ferrous Metals at Varying Ranges of Stress and at Intermediate and High Temperatures, T. M. Jasper. Lond., Edinburgh, & Dublin Philosophical Mag. & J. Sci., vol. 46, no. 274, Oct. 1923, pp. 609-627, 10 figs. Development of energy equation with reference to testing; testing materials at various temperatures; application

of use of energy relation to static testing of ferrous materials at various temperatures. Conclusions based on fatigue experiments.

#### MICROMETERS

**Ocular.** A New Ocular Micrometer, Hermann Kellner. Optical Soc. Am.—Jl., vol. 7, no. 10, Oct. 1923, pp. 889-891, 4 figs. Describes micrometer employing sliding measuring wedge in place of micrometer screw.

#### MILLING CUTTERS

**Spacing.** Combination Distance Pieces, Machy. (London), vol. 23, no. 578, Oct. 25, pp. 113-115, 4 figs. Novel system of spacing collars for accurately positioning milling cutters.

#### MOTOR BUSES

**Double-Deck.** New Sixty-nine-Passenger Double-Decker Installed in Chicago. Bus Transportation, vol. 2, no. 9, Sept. 1923, pp. 427-430, 11 figs. Describes bus developed by Yellow Coach Mfg. Co., with 4-wheel brakes, rigid frame and sleeve-valve engine.

**Improvements.** Low Frames, Air-Brakes and 6-Cylinder Engines Feature New Buses, Herbert Chase. Automotive Industries, vol. 49, no. 16, Oct. 18, 1923, pp. 779-784, 8 figs. Federal, International, Yellow, Pierce-Arrow and Acme show new models at exhibit in Atlantic City; changes in Mack, White and F. A. C.

**Six-Wheel.** A Six-Wheel Stage Is Developed in California. Bus Transportation, vol. 2, no. 6, June 1923, pp. 265-267, 6 figs. Describes vehicle with a 4-wheel rear end in service on Cal. Transit Co.'s system, having seating capacity of 26; 26 ft. long from front to rear bumpers; better braking, no skidding, wider tread, more tire mileage and easier riding are advantages claimed for it.

**Street Cars vs.** Comparative Utility of Motor 'Bus and Tramcar. Elec. Ry. & Tramway Jl., vol. 49, no. 1202, Sept. 14, 1923, pp. 120-121, 172 and 174-175, 4 figs. Report by H. Mattinson to Manchester Tramways Committee, discussing advantages and disadvantages of the two vehicles, trackless-trolley buses, spheres of operation of motor bus, capital and operation costs, etc.

**25-Passenger Body.** A Bus a Day Turned Out by Operator. Bus Transportation, vol. 2, no. 11, Nov. 1923, pp. 515-518, 4 figs. Details of construction of new 25-passenger bodies designed and built in shops of Pacific Elec. Ry. at Torrance, Cal.; how six buses a week were put through car shops.

**Youngstown, Ohio, Service.** De Luxe Service Given by Interurban Coach Line. Bus Transportation, vol. 2, no. 4, Apr. 1923, pp. 175-178, 7 figs. Pennsylvania-Ohio Elec. Co. operates coach lines paralleling interurban routes; revenues of both lines increased, competition lessened and traffic divided into two classes since adoption of coaches; lines serve steel manufacturing and farming district bordering on Ohio-Pennsylvania line.

#### MOTOR PLOWS

**Comparative Tests, M.A.N. and Stock.** A Comparative Test of the M.A.N. and Stock Motor Plows (Eine Vergleichsprüfung der Motorpflüge MAN und Stock), H. Martiny. Motorwagen, vol. 26, no. 25, Sept. 10, 1923, pp. 371-374. Results of experiments and conclusions for the constructor and for testing of motor plows.

#### MOTOR TRUCKS

**A.E.C.** An A.E.C. 2-Tonner. Motor Transport, vol. 37, no. 970, Oct. 1, 1923, pp. 414-417, 7 figs. Entirely new model for goods or passenger service embodying many special feature; 4-cylinder engine developing 30 b.h.p. at 1000 r.p.m.; 4-speed gear box.

**French.** Continental Transport Vehicle Design. Motor Transport (London), vol. 37, no. 975, Nov. 5, 1923, pp. 568-569. Data in tabular form giving leading dimensions of business vehicle and municipal chassis on French market.

**German.** German Lorry Design. Motor Transport, vol. 37, no. 970, Oct. 1, 1923, pp. 418-419, 1 fig. Tendencies of chassis building practice as shown by a percentage comparison between 1922 and 1923 models.

**Karrier.** The 20-25 Cwt. Karrier. Motor Transport (London), vol. 37, no. 975, Nov. 5, 1923, pp. 556-558, 7 figs. Details of Z type Karrier chassis; 4-cylinder 18.2-hp. engine; standard pneumatic tire equipment.

**Krupp Special Types.** Motor Vehicles Constructed by Krupp. Krupp'sche Monatshefte, vol. 4, Sept. 1923. Contains following articles: Motor Fire Engines, (Motor-Feuerspritze Bauart Krupp), Heinrich Eckertz, pp. 151-153, 2 figs.; Special Motor Trucks for Transport of Bulk Goods, Bar Iron, Lumber, Etc. (Sonderkraftfahrzeuge für Sperr- und Massengut), H. Hageloch, pp. 153-159, 10 figs. Modern Street-Cleaning Vehicles (Ueber neuzeitliche Strassenreinigung), Fr. Sachtleben, pp. 159-163, 6 figs.

**Radiators.** Motor-Truck Radiator-Design, R. S. Wentworth. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 393-394. Enumerates seven requirements dictated by necessity for greater reliability of truck radiators.

#### MOTORCYCLES

**Berlin Show.** Motorcycles at the Automobile Show 1923 (Berlin) (Die Motorrad auf der Automobil-Ausstellung 1923), G. Stünlein. Motorwagen, vol. 26, no. 27, Sept. 30, 1923, pp. 409-410. Details of exhibits.

**British Show.** The Cycle and Motor-Cycle Show at Olympia. Engineering, vol. 116, nos. 3016 and 3017, Oct. 19 and 26, 1923, pp. 503-506 and 519-522, 20 figs. Details of design of exhibits.

## O

#### OIL ENGINES

**Airless-Injection.** Solid Injection Fuel Systems of Oil Engines, Richard D. Watson. Oil Engine Power, vol. 1, no. 10, Oct. 1923, pp. 495-497. Notes on design of spray valves and fuel pumps for airless injection engines, with consideration of factors influencing problems that have to be met.

**Development.** The Crude Oil Engine, Johnstone-Taylor. Gas & Oil Power, vol. 19, nos. 215, 216 and 217, Aug. 6, Sept. 6 and Oct. 4, 1923, pp. 184-186, 203-205 and 11-14, 13 figs. Development of present designs. Convertible gas and oil engines; describes four-stroke and two-stroke engines.

**Marine, Clyde.** Clyde Marine Oil-Engines, A. L. Mellanby. Instn. Mech. Engrs.—Proc., no. 4, June 1923, pp. 695-731, 15 figs. Deals with tonnage regulations; lubrication problems; starting and manoeuvring; power rating. Particular types of Clyde engines; examples of four- and two-stroke cycle engines; double-acting engines.

**Marine, Design.** Small Marine Engine Design from the User's Point of View, Basil H. Joy. Automobile Engr., vol. 13, no. 182, Nov. 1923, pp. 343-347, 6 figs. Deals specifically with 4-cycle poppet-valve gasoline engine without any reversing gear, with view to ease of manufacture (price), ease of overhaul, and ease of access for more or less minor adjustments, repairs, or renewals.

#### OIL FUEL

**Characteristics.** Fuel Oil Characteristics and Advantages As Compared with Coal, A. P. Bjerregaard. Nat. Petroleum News, vol. 15, no. 42, Oct. 17, 1923, pp. 32A-32B. Some comparisons of B.t.u. values of various gravities of Mid-Continent fuel oils, and comparative price table of fuel oil and coal based on a B.t.u. value for fuel oil of 19,000-per-lb. and 10,000-per-lb. coal; methods for testing water content of fuel oil. Paper read before Purchasing Agents' Assn.

**Gasification.** External and Internal Gasification (Ueber äussere und innere Vergasung), S. della Porta. Motorwagen, vol. 26, no. 25, Sept. 10, 1923, pp. 377-378. Discusses process of gasification, and investigates gasification from viewpoint of distribution of gasified fuel in the air.

#### OPEN-HEARTH FURNACES

**Regenerators.** Open-Hearth Furnace Regenerators, Fred B. Quigley. Iron Age, vol. 112, no. 19, Nov. 8, 1923, pp. 1245-1246, 1 fig. Proportionate sizes of chambers for air and gas; insulation; doing away with gas regenerators suggested. (Abstract.) Paper read before Am. Iron & Steel Inst. See also Iron Trade Rev., vol. 73, no. 17, Oct. 25, 1923, pp. 1172-1173 and 1181-1182, 1 fig.

#### OXY-ACETYLENE WELDING

**Applications.** Practical Applications of Gas welding, E. A. Whittaker. Engineering, vol. 116, no. 3018, Nov. 2, 1923, pp. 571-572. Deals with repairs and construction of iron and steel, cast iron, aluminum, copper, brasses and bronzes. (Abstract.) Paper read before Instn. Welding Engrs.

**Equipment Maintenance.** Maintaining Oxy-Acetylene Equipment in Service, Acetylene Jl., vol. 25, nos. 4 and 5, Oct. and Nov. 1923, pp. 201-204 and 206; and 234, 236 and 238, 5 figs. Proper maintenance of oxy-acetylene welding and cutting equipment.

**Locomotive Repairs.** Welding in Locomotive Repair Shops, Fred E. Rogers. Acetylene Jl., vol. 25, no. 5, Nov. 1923, pp. 221-228 and 232, 19 figs. Particulars regarding the various oxy-acetylene welding operations that have been profitably employed in locomotive repair work. Paper read before Chattanooga Regional meeting of Southern Local Sections of A.S.M.E.

## P

#### PACKING

**Containers.** Solving the Shipping Container Problem, B. L. Huestis. Management & Administration, vol. 6, no. 5, Nov. 1923, pp. 575-580, 9 figs. Discusses faults in crate construction; wooden boxes; fiber boxes; testing of containers; method of testing by vibration; savings made by large manufacturers.

#### PATTERNS

**Automotive, Drafting.** Automotive Pattern Drafting, Warren Scholl. Sheet Metal Worker, vol. 13, nos. 25, 26 and vol. 14, nos. 1, 2, 4, 6, 8, 11 and 13, Jan. 5, 19, Feb. 2, 16, Mar. 2, Apr. 13, May 11, June 22 and July 20, 1923, pp. 840-844, 894-897, 6-7 and 36, 46-47, 83-84, 204-206, 283-295, 405-407, 490-491 and 515, 43 figs. Describes methods of laying out patterns for—Jan. 5: Fender with straight seam edge parallel in plan to straight chassis flange. Jan. 19: Hoods. Feb. 2: Radiator splash shields. Feb. 16: Cylindrical tanks. Mar. 2 and Apr. 13: Rear fenders for touring cars. May 11: Running-board shields. July 20: Full crown front fenders.

#### PEAT

**Boiler Fuel.** Engineering Principles Involved in the Firing of Peat in Boiler Operation (Die Feuerungstechnik des Torfes im Dampfkesselbetrieb), W. Leder. Wärme, vol. 46, nos. 33, 34, 36, 37 and 38, Aug. 17, 24, Sept. 7, 14 and 21, 1923, pp. 363-367, 377-380, 400-404, 411-414 and 419-421, 3 figs. Properties of peat as technical fuel; thermal value, evaporative

**Steel Plate Construction**  
\* Bigelow Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

capacity and efficiency; behavior on grate; velocity of combustion; peat in mixture with other fuels; evaporating results with peat in different types of furnaces; tests with mixtures of peat and other fuels.

#### PHOTOELASTICITY

**Application to Engineering Problems.** Engineering Problems Solved by Photo-Elastic Methods, E. G. Coker. Franklin Inst.—Jl., vol. 196, no. 4, Oct. 1923, pp. 433-478, 34 figs. Lecture I: Improvements in apparatus; contact pressures and stresses. Lecture II: The testing of materials in tension; action of cutting tools. Bibliography.

#### PIPE

**Wrapping Machines.** Automatic Pipe-Wrapping Machine, Edward Houchins. Indian & Eastern Engr., vol. 52, no. 1, July 1923, pp. 18-19, 4 figs. Portable, automatic machine made by San Francisco firm, through which pipe of diameters up to 10 in. can be fed, and thoroughly wrapped so as to be impervious to moisture, at rate of 750 lin. ft. per hr.

#### PISTON RINGS

**Finishing Grooves.** Finishing Piston-Ring Grooves. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 407-408. Information on various practical methods.

#### PLANING

**Rotary, High-Speed.** High-speed Rotary Planing, Stafford Ransome. Engineer, vol. 136, nos. 3337, 3538 and 3539, Oct. 12, 19 and 26, 1923, pp. 388-390, 413-415, and 441-445, 15 figs. Oct. 12: Theory and practice; ridging and tracking; square and circular blocks; feed and its effect. Oct. 19: Cutters and cutter blocks. Oct. 26: High-speed rotary planing machine; variable feed gears; feeding in tables; high-speed flooring machines; problem of pressures; driving.

#### POLISHING

**Abrasives, Application to Wheels.** Practical Hints for Polishers, Francis D. Bowman. Foundry, vol. 51, no. 21, Nov. 1, 1923, pp. 860-861, 3 figs. Helpful suggestions touching on properties and preparation of glue, correct temperature in setting up and storing wheels together with method of applying abrasive to wheels.

#### POWER PLANTS

**Cost Keeping.** Uniform Costs for Power Plants, Alfred Baruch. Power Plant Eng., vol. 27, nos. 12, 13, 14 and 15, June 13, July 1, 15 and Aug. 1, 1923, pp. 623-625, 671-673, 720-722 and 774-775, 3 figs. June 15: Labor records; pay-roll distribution; budget labor costs. July 1: Factors entering into intelligent analysis of operating expenses. July 15: Distribution of fixed expenses; interest and depreciation in plant costs. Aug. 1: Predetermination of rates and monthly comparison of plant costs.

**Piping Standards.** Standards in Power Plant Piping Practice. Power Plant Eng., vol. 27, no. 14, July 15, 1923, pp. 717-719, 3 figs. Commercial practice varies so that piping standards may become confusing. Points out many of the practices which must be watched for.

**Solid-Injection Oil Engines for.** Solid Injection Engine in Isolated Power Plants, H. F. Briggs. Eng. World, vol. 23, no. 4, Oct. 1923, pp. 228-231. Comparative cost analysis of twelve different prime movers; states that solid-injection oil engines require skilled attention, and when this is supplied will prove themselves thoroughly reliable and dependable; simplicity of design and cheapness of power output make them ideal prime mover for isolated power plant.

**Testing.** Power Plant Testing, W. M. Selvey. South Wales Inst. Engrs.—Proc., vol. 38, no. 8, Sept. 26, 1923, pp. 631-663 (and discussion) 663-667, 29 figs. Discusses principles involved and measuring apparatus available.

#### PRESSES

**Drawing Tools for Presses.** Design and Operation of Drawing Tools for Presses (Wirkungsweise und Bauart der Ziehwerkzeuge), W. Sellin. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 41, Oct. 13, 1923, pp. 972-975, 17 figs. Drawing tools for drawing and for eccentric presses.

#### PRODUCER GAS

**Peat as Source of.** Producer Gas From Peat, G. W. Semmes. Manufacturers Rec., vol. 84, no. 16, Oct. 18, 1923, pp. 75-77. Survey of possibilities of peat as a gas producer; gas producers.

#### PULVERIZED COAL

**Boiler Firing.** Powdered Coal Meets Load Variations in Blast-Furnace Gas Plant. Power, vol. 58, no. 19, Nov. 6, 1923, pp. 718-721, 5 figs. In boiler installation in Ensley Works of Tennessee Coal, Iron & Railroad Co. pulverized coal supplements blast-furnace gas to maintain uniform supply of steam; outstanding features of plant are automatic control of gas and air mixture and feed of pulverized coal.

#### PUMPING STATIONS

**Construction.** Typical Power-Plants and Pumping-Stations for Water-Works, Charles B. Burdick. Am. City Mag., vol. 29, no. 5, Nov. 1923, pp. 467-471, 2 figs. Examples of recent pumping-station construction, with illustrations and figures of cost.

**Equipment Selection.** Equipment for Pumping Stations, A. L. Mullergren. Can. Engr., vol. 45, no. 14, Oct. 2, 1923, pp. 366-367. Considerations in selecting equipment; reliability, adequacy and economy principal factors; efficiency of central stations.

#### PUMPS

**Axiflo.** Pumping Plants to Lower Water Level. Ariz. Min. Jl., vol. 7, no. 10, Oct. 15, 1923, pp. 6-8, 7 figs. Study of handling of rising water level in Salt

River valley by engineers of Worthington Pump and Machinery Co. which led to development of new Axiflo pump.

#### PUMPS, CENTRIFUGAL

**High-Lift.** High Lift Turbine Pumps. Beama, vol. 13, no. 67, Nov. 1923, pp. 317-320, 6 figs. Describes turbine pumps for high-lift conditions manufactured by Mirlees Watson Co. in two distinct forms, the ring and the barrel casing types.

## R

#### RAILS

**Transverse Fissures.** Formation of Transverse Fissures in Steel Rails, James E. Howard. Eng. News-Rec., vol. 91, no. 18, Nov. 1, 1923, pp. 720-722. Abstract of latest report to Interstate Commerce Commission, together with discussion.

#### RAILWAY ELECTRIFICATION

**England.** Railway Electric Traction, Roger T. Smith. Ry. Gaz., vol. 39, no. 17, Oct. 26, 1923, pp. 511-512. Discusses question of railway electrification in England as an economic proposition. Address before Société des Ingénieurs Civils de France.

**Norway.** Electrification of Railway from Narvik to Riksgränsen in Norway (Den elektriserede Ofotbane), H. J. Schreiner. Teknisk Ukeblad, no. 33, Aug. 31, 1923, pp. 271-275, 8 figs. Description of Norwegian part of railway between Lulea, Sweden and Narvik, Norway; transmission line will carry single-phase current at 80,000 volts and 15 cycles, which will be reduced to 16,200 volts in two transformer stations, each having two 1500-kva transformers.

#### RAILWAY MOTOR CARS

**Electric.** Motor Cars for the Mersey Electric Railway. Ry. Gaz., vol. 39, no. 18, Nov. 2, 1923, pp. 556-557, 1 fig. Particulars of new motor cars for operating three- and five-car trains; overall length 60 ft. 3 1/2 in., width overall 8 ft. 7 in., height from rail to top of roof 12 ft. 10 in.; electro-pneumatic control.

**Gasoline.** Multiple Unit Control for Self-Propelled Cars. Ry. Rev., vol. 73, no. 17, Oct. 27, 1923, pp. 610-617, 11 figs. Describes new Mack car, electro-pneumatically controlled, equipped with six-cylinder 120-hp. gasoline motor.

**Two-Car Train.** Two-Car Motor Train for the Mississippi Central. Ry. Age, vol. 75, no. 20, Nov. 17, 1923, pp. 899-900, 4 figs. Chassis, of 4-wheel drive type, and trailer provide baggage space and seats for 46 passengers.

**Types.** Report of Committee (Assn. Ry. Elec. Engrs.) on Self-Propelled Rail Cars. Ry. Elec. Engr., vol. 14, no. 11, Nov. 1923, pp. 333-338, 8 figs. Advantages and drawbacks of different types of railway motor cars and class of service for which they are fitted.

#### RAILWAY OPERATION

**Car Pooling.** Car Pooling on the Pennsylvania, Geo. L. Fowler. Ry. & Locomotive Eng., vol. 36, no. 11, Nov. 1923, pp. 361-362. Its origin and effect on cost of repairs and facilitating transportation.

**Slow Freight Traffic.** Slow-Freight Traffic. Int. Ry. Congress Assn.—Bul., vol. 5, no. 6, June 1923, pp. 558-589. Account of discussion dealing with organization of slow-freight traffic in order to increase effective operation of rolling stock and lines; advisability of using, according to circumstances, heavy or light, fast or slow trains; through trains; pick-up trains and distributing trains; shuttle services.

**Train Control.** Automatic Train Control on the Missouri Pacific R. R., Bertram H. Mann. Ry. Rev., vol. 73, no. 19, Nov. 10, 1923, pp. 681-683, 1 fig. Describes underlying principles of automatic train control so far as operation of trains, and its influence on track capacity, is concerned.

**G.R.S. Train Control Demonstrated on C. & N. W. Ry.** Age, vol. 75, no. 16, Oct. 20, 1923, pp. 717-718, 4 figs. Actual service test shows practicability of intermittent tapered speed control and stop indications.

**Train Control.** Ry. Signaling, vol. 16, no. 11, Nov. 1923. Contains following articles: Train Control Experience of C. & E. I., pp. 438-440, 4 figs.; C. & A. Tests National Train Control, pp. 441-442, 2 figs.; C. & N. W. Tests G. R. S. Train Control, pp. 443-445, 8 figs.

**Train Despatching.** Telephone Selector Systems in Use on Railroads, Chas. Stanley Rhoads. Ry. Signaling, vol. 16, no. 11, Nov. 1923, pp. 458-461, 3 figs. Methods of train despatching by telephone; selectors—description, uses and requirements.

#### RAILWAY REPAIR SHOPS

**Locomotive.** Locomotive Shop Served by 180-Ton Crane. M.-K.-T. R. R. Eng. News-Rec., vol. 91, no. 19, Nov. 8, 1923, pp. 762-764, 4 figs. Transverse track layout; enlargement and future transfer table.

**Progressive System for Locomotive Shops,** Lawrence Richardson. Ry. Age, vol. 75, no. 17, Oct. 27, 1923, pp. 767-770, 2 figs. Straight-line method used in modern industrial plants applied to classified repairs.

#### RAILWAY SHOPS

**Electric Welding.** Report of Committee (Assn. Ry. Elec. Engrs.) on Electric Welding. Ry. Elec. Engr., vol. 14, no. 11, Nov. 1923, pp. 367-369, 4 figs. Economic status of arc welding, and relative costs of electric arc welding and other processes, particularly oxy-acetylene.

#### RAILWAY SIGNALING

**Automatic Block.** Direct Current Automatic Block Signaling. Am. Ry. Assn. Signal Section—

advance notice for meeting Nov. 14-15, 1923, pp. 111-144. Instructions for making train shunt resistance tests; and for testing resistance of switch circuit controller, shunting circuits and contacts; report on maximum resistance for switch circuit controllers, shunting circuits and contacts. Report of Committee IV.

**Economics.** Economics of Railway Signaling. Am. Ry. Assn. Signal Section—advance notice for meeting Nov. 14-15, 1923, pp. 145-157, 2 tables. Economic value of operating remote switches; savings effected by use of power switch machines for operation of remote switches as reported by railways. Report of Committee I.

**Highway Crossings.** Highway Crossing Signals on the N.Y.C.R.R. Ry. Rev., vol. 73, no. 18, Nov. 3, 1923, pp. 647-649, 4 figs. Gives circuits and methods of control and operation of highway crossing signals which have been installed by N. Y. Central at some of its busiest street intersections at grade.

**Interlocking.** Mechanical Interlocking. Am. Ry. Assn. Signal Section—advance notice for meeting Nov. 14-15, 1923, pp. 96-110. Specification for electro-mechanical interlocking machine, unit electric levers, and locking. Report of Committee II.

**New Interlockers on the Flint Belt Line,** H. C. Lorenzen. Ry. Signaling, vol. 16, no. 11, Nov. 1923, pp. 447-449, 7 figs. One electric plant handles two separate crossings that are 3450 ft. apart; trunking superseded by suspended cables; tower has three floors.

**Power Interlocking.** Am. Ry. Assn. Signal Section—advance notice for meeting Nov. 14-15, 1923, pp. 18-23, 4 figs. Specification for location and layout for way stations; typical plans for joint occupancy of signal stations by telegraph and telephone apparatus. Report of Committee III.

#### RAILWAY TIES

**Hollow Elastic.** The Nature and Advantages of Elastic Railway Ties (Das Wesen und die Vorteile der elastischen Schienenunterstützung), H. Scheive. Verkehrstechnik, vol. 40, no. 37, Sept. 14, 1923, pp. 341-342, 3 figs. Discusses elastic hollow ties recommended by author and comparative tests with these and inelastic steel trough-shaped ties heretofore in use.

**Reinforced-Concrete.** The Stent Reinforced Concrete Railway Sleeper. Engineering, vol. 116, no. 3017, Oct. 26, 1923, pp. 536-537, 8 figs. Describes reinforced-concrete sleeper of block-and-tie pattern now in use on several railways in India, and points out advantages of system.

**Specifications.** Ties. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 257, July 1923, pp. 10-15, 6 figs. Fundamentals to be considered in designs of substitute ties; care of ties after distribution; installation and keeping records of cross-tie test sections.

**Treatment and Care.** Treatment and Care of Railroad Ties, S. D. Cooper. Eng. & Contracting (Railways), vol. 60, no. 4, Oct. 17, 1923, pp. 818-821, 2 figs. Describes practice of Atchison, Topeka & Santa Fe Ry. Paper read before Roadmasters & Maintenance of Way Assn.

#### RAILWAY TRACK

**Maintenance.** Maintenance of Way—Improved Methods and Results on the Lehigh Valley Railroad, C. L. Moore. Central Ry. Club—Official Proc., vol. 31, no. 4, Sept. 1923, pp. 1408-1417. Description of use of locomotive cranes for rail anchoring, track laying and rapid handling of material; important economies effected.

**Specifications.** Track. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 257, July 1923, pp. 21-25. Addition to frog and switch plans; details of switch-stand target shapes; oiling track fixtures; specifications for laying of new track.

#### REFRIGERATING MACHINES

**Air.** Cooling With Air, M. Leblanc. Refrig. Eng., vol. 10, no. 3, Sept. 1923, pp. 101-106, 11 figs. Use of air as a refrigerating agent in place of chemicals; study of air refrigerating machines, including their cycle, fundamental observations, how cycle is effected in practical machines, conception of new machine, scavenging operations, and manner of realizing a machine with scavenging operation applied. From Revue Générale du Froid, Oct. 1922.

**Automatic.** Automatic Refrigerating Machinery, J. C. Goosmann. Ice & Refrigeration, vol. 63, no. 6, Dec. 1922, pp. 61-63, and vol. 64, nos. 2, 3 and 4, Feb., Mar. and Apr., 1923, pp. 131-135, 205-210 and 320-323, 20 figs. Three general groups of refrigerating plants; semi- and fully automatic refrigerating machinery; lubrication; water-flow control; condenser safety valves.

#### ROLLING MILLS

**Sheet Mills.** Making Sheets at Granite City (Ill.), E. C. Boehringer. Iron Trade Rev., vol. 73, no. 20, Nov. 15, 1923, pp. 1363-1366, 8 figs. Describes new sheet and jobbing mills of Nat. Enameling & Stamping Co.; coke-oven gas and coal used as fuel; mechanical equipment reduces labor costs.

## S

#### SANDS, MOLDING

**Minnesota.** The Foundry Sands of Minnesota, G. N. Knapp. Univ. of Minn., Geol. Survey—Bul., no. 18, 1923, 105 pp., 15 figs. Report of investigation begun in 1918. Geology; geological formations yielding foundry sands, loams and clays; list of Minnesota foundries and localities supplying them with foundry sands; laboratory methods of testing foundry sands, loams and clays; mechanical and mineral analyses.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**Testing and Standardization.** The Testing of Moulding Sands with Special Reference to Standardization. C. W. H. Holmes. Foundry Trade J., vol. 28, nos. 372 and 373, Oct. 4 and 11, 1923, pp. 296-298 and 308-311, 1 fig. Chemical and mineral constitution; meaning of "clay"; mechanical constitution; methods employed for mechanical grading sand; nature and estimation of bond; venting properties; strength or cohesiveness of sands; selection of standardization of tests. Paper presented to Paris Congress.

#### SCALES

**Railway Service.** Specifications for the Manufacture and Installation of Motor-Truck, Built-In, Self-Contained, and Portable Scales for Railroad Service. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 257, July 1923, pp. 40-60.

#### SCRAP

**Utilization.** Saving Money from Scrap Materials. Indus. Management (Lond.), vol. 10, no. 9, Nov. 1, 1923, pp. 242-243. Examples of savings effected by utilization of scrap material in large electrical works.

#### SEAPLANES

**Navy-Wright-2.** The American Navy-Wright Schneider Cup Challenger. Flight, vol. 15, no. 39, Sept. 27, 1923, p. 575, 2 figs. Describes the N.W.-2, one of the American entries for Schneider Cup Seaplane Race; a biplane having 700-hp. Wright T-type engine; wing spread 28 ft., height 11 ft. 7 1/2 in., length 28 ft. 4 1/2 in.

**Schneider Race, England.** On the Schneider Trophy Competition. Aeroplane, vol. 25, no. 14, Oct. 3, 1923, pp. 329-330, 332, 334, 336, 340, 342, 344, 346, 348, 350 and 352, 14 figs. Account of race. Includes article by W. H. Sayers entitled The Lesson of the Schneider Cup Race, discussing design of winning Curtiss racer, and design of other competing planes. Notes on the navigability trials. See also Flight, vol. 15, no. 40, Oct. 4, 1923, pp. 592-601, 16 figs.

The Story of the Schneider Cup Seaplane Race. Aviation, vol. 15, no. 19, Nov. 5, 1923, pp. 574-576, 4 figs. Description of American, British and French teams; America's victory; British performance.

#### SEMI-DIESEL ENGINES

**Primm.** Outstanding Features in Modern Oil Engines. Julius Rosbloom. Ariz. Min. J., vol. 7, no. 11, Nov. 1, 1923, pp. 18-19, 2 figs. Details of "Primm" oil engine, a two-cycle semi-Diesel engine, manufactured by Power Mfg. Co. at Marion, Ohio, and principle of its operation.

#### SEPARATORS

**Oil.** The "Rocket" Oil Separator. Engineering, vol. 116, no. 3016, Oct. 19, 1923, pp. 492-493, 1 fig. Device can be installed on ship for purpose of recovering oil and discharging only clear water overboard; can also be installed on shore for treating oil discharge from ships in port. See also Petroleum Times, vol. 10, no. 250, Oct. 20, 1923, pp. 557-559, 2 figs.

#### SHAFTS

**Critical Speeds.** The Critical Speeds of Turbine Shafts (Die kritischen Drehzahlen von Turbinenwellen). Wilh. Müller. Zeit. für technische Physik, vol. 4, no. 3, 1923, pp. 88-93, 3 figs. Describes theory of critical speeds of rotating shafts with constant and inconstant mass distribution, taking natural weight into consideration.

The Determination of the Critical Speeds of Elastic Shafts and Their Stability (Ueber die Bestimmung der kritischen Drehzahlen von elastischen Wellen und deren Stabilität). Theodor Pöschl. Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 4, Aug. 1923, pp. 297-312, 5 figs. Dynamic investigation prompted by troubles observed in operation of steam turbines and similar machines with high-speed elastic shafts and in disks mounted on these machines.

**Critical Torsional Moment.** The Critical Twisting Moment of Shafts (Das kritische Drillungsmoment von Wellen). R. Grammel. Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 4, Aug. 1923, pp. 262-271, 4 figs. Calculation of critical moment of torsion for any given cross-sections.

#### SMOKE

**Physico-Chemical Investigation.** The Physico-Chemical Investigation of Smoke as a Basis for Its Abatement and Utilization (Die physikalisch-chemische Erforschung des Rauches als Grundlage seiner Bekämpfung und Verwertung). V. Kohlschütter. Metall u. Erz, vol. 20, no. 19, Oct. 8, 1923, pp. 345-353. Results of application of physical chemistry to investigation of smoke.

#### SOLDERS

**Aluminum.** A New Aluminum Soldering and Welding Medium ("Hüroco"), ein neues Aluminium-Lötl- und Schweissmittel, Max Wille. Fördertechnik u. Frachtverkehr, vol. 16, no. 18, Sept. 18, 1923, pp. 206-208, 5 figs. Describes new preparation known as Hüroco solder, chief advantage of which is that it does not flow when melted but changes gradually into a pasty condition so that it can be molded as a plastic mass the same as sculpture clay.

#### SOOT BLOWERS

**Mechanical.** Economies of Mechanical Soot Blowers. Robert June. Power Plant Eng., vol. 27, no. 21, Nov. 1, 1923, pp. 1070-1073, 5 figs. Savings due to use of soot blowers; comparative costs of soot blowing.

#### STEAM

**Specific Heat.** Conclusions from Latest Investigations at Munich, Germany, of the Specific Heat of Steam (Folgerungen aus den neuesten Münchener Untersuchungen der spezifischen Wärme des Wasserdampfes). H. Schmolke. Wärme, vol. 46, no. 37, Sept. 14, 1923, pp. 409-410. Supplement to author's article in same journal, no. 23, 1923.

#### STEAM-ELECTRIC PLANTS

**England.** The Bolton Electricity Undertaking. Elec. Rev., vol. 93, no. 2394, Oct. 12, 1923, pp. 540-543, 7 figs. Generating station will have ultimate capacity of 46,000 kw.; turbine room contains six turbines of different sizes and makes, each coupled to generator and exciter.

**Manchester, England.** England's Latest Generating Station. W. H. Onken. Elec. World, vol. 82, no. 20, Nov. 17, 1923, pp. 1010-1012, 6 figs. Features of Barton station of Manchester Corp.; it is of superpower type sanctioned by Great Britain's Electricity Commission and is typical of modern English steam-station practice.

**Two Pressures, Operation with.** Lorain Plant Operates With Two Pressures. Power Plant Eng., vol. 27, no. 22, Nov. 15, 1923, pp. 1117-1123, 9 figs. Pressure of new 20,000-kw. unit is 100 lb. higher than on old unit.

#### STEAM POWER PLANTS

**Natural Steam.** Power and Boric Acid from Natural Steam in Tuscany. Chem. & Industry, vol. 42, no. 43, Oct. 26, 1923, pp. 1022-1024, 3 figs. Describes large chemical plant, in which volcanic steam is utilized first to produce electrical power and afterwards for manufacture of boric acid.

**Remodeling.** More Power with Less Coal at Saxony Mills Plant (St. Louis). Power, vol. 58, no. 20, Nov. 13, 1923, pp. 773-774, 1 fig. New chain-grate stokers in enlarged combustion chambers and addition of mixed-pressure turbo-generator to Corliss engine rope-drive plant, improve economy and increase capacity.

#### STEAM TURBINES

**Development.** Development of the Steam Turbine. Stanley S. Cook. Roy. Soc. Arts—Jl., vol. 71, nos. 3695, 3696 and 3697, Sept. 14, 21 and 28, 1923, pp. 729-738, 743-760 and 762-770, 33 figs. Sept. 14: Principle of compounding; early indications of directions of progress; marine development with direct-coupled turbines; problem of propeller; combination of turbine and reciprocating engine; passing of direct-coupled marine turbine. Sept. 21: Introduction of mechanical gearing; application to large powers in naval vessels; lubrication of thrust blocks and bearings; mercantile marine turbine; comparison of modern and early efficiencies; methods of attaching blades; reaction and impulse types; progress in economy and output of land turbines; problem of exhaust area. Sept. 28: Application of mechanical gearing to land turbines; geared turbo-generators; geared turbines for mill driving; direct-coupled turbo-alternators; construction of rotors; ventilation of stators; latest improvements in economy of turbines by reheating and cascade feed heating.

**High-Pressure.** Steam Turbines for High Pressures (Die Dampfturbinen für hohe Drücke). Karl Münchsdorfer. Zeit. des Bayerischen Revisions-Vereins, vol. 27, nos. 17 and 18, Sept. 15 and 30, 1923, pp. 129-130 and 142-143, 5 figs. Discusses change in superstructure of turbine caused by use of high-pressure steam; possibilities of introducing high-pressure turbines in power plants are exemplified.

**Marine.** See MARINE STEAM TURBINES.

#### STEEL

**Automobile, Failures in.** Failures in Steel Parts. Automobile Engr., vol. 13, no. 181, Oct. 1923, pp. 298-299, 10 figs. Notes on causes of breakage in common automobile components.

**Chrome-Vanadium.** See CHROME-VANADIUM STEEL.

**Cold Working.** Manufacture of Bright-drawn Bar, Wire, and Cold-rolled Strip. Machy. (Lond.), vol. 23, no. 579, Nov. 1, 1923, pp. 129-133, 8 figs. Production methods employed by Arthur Lee & Sons, Sheffield.

**Crystal Structure.** Examination of Steel by the X-ray Spectrometer. Hermann H. Zornig. Army Ordnance, vol. 4, no. 20, Sept.-Oct., 1923, pp. 77-83, 4 figs. Evidence shows that, at ordinary temperatures, in plain carbon steels of hypereutectoid composition, crystal structure, as shown by X-ray spectrometer, varies through continuous series from that existing when metal has been very rapidly cooled from temperature in or above critical range to that existing when cooling has been very slow from temperature above critical range.

**Seasoning.** The Seasoning of Steel. W. P. Wood. Am. Soc. for Steel Treating—Trans., vol. 4, no. 4, Oct. 1923, pp. 488-493. Describes experiment consisting in comparing tensile properties of several varieties of unhardened steel before and after exposure of one year to varying temperature of atmosphere.

**Stainless.** Stainless Steel, with Particular Reference to the Milder Varieties (Stainless Iron). John H. G. Monypenny. Am. Inst. Min. & Met. Engrs.—Trans., no. 1277-S, Nov. 1923, 17 pp., 18 figs.; also (abstract) in Min. & Metallurgy, vol. 4, no. 203, Nov. 1923, pp. 574-575. Structure and general properties of steel containing 11 to 14 per cent of chromium after different forms of heat treatment and effect on such material of variations in carbon content; effect of variations in composition and heat treatment on resistance to corrosion of such high-chromium steel; special properties produced in such steel when carbon content is reduced to 0.10 per cent.

**Surface Hardening.** Nitrogen in Iron and Steel: A New Method of Surface Hardening. Iron & Coal Trades Rev., vol. 107, no. 2904, Oct. 26, 1923, p. 624. Data on new method of surface hardening steel by nitrating it and on results of investigation into ferro-nitrogen alloys, from article by Ad. Fry published in Stahl u. Eisen.

**Tests.** Static and Dynamic Tests for Steel. J. M. Lessells. Am. Soc. for Steel Treating—Trans., vol. 4, no. 4, Oct. 1923, pp. 536-545, 11 figs. Deals with static and dynamic forms of testing, tensile test being taken as representative of former, and repeated shock and fatigue as representative of latter; describes types of shock and fatigue testing machines with experimental results obtained.

The Relation Between the Dynamic and the Static Tensile Tests. Harold Albert Nisley. Army Ordnance, vol. 4, no. 20, Sept.-Oct. 1923, pp. 88-93, 4 figs. Investigation to determine relationship existing between results of static and dynamic tests for each heat treatment, and to show whether this relationship did, or did not, vary as function of structure of material.

#### STEEL CASTINGS

**Acid Electric.** Acid Electric Steel Castings. Larry J. Barton. Iron Age, vol. 112, no. 19, Nov. 8, 1923, pp. 1249 and 1299-1301, 1 fig. Cardinal points in good practice; scrap and making bottom; charging and melting down; high-carbon and chrome steel.

**Converter vs. Electric.** Comparison of Converter and Electric Steel Castings. Thomas Hill. West. Machy. World, vol. 14, no. 10, Oct. 1923, pp. 330-332. Analysis of differences in steels obtained; characteristics of some converter steels.

#### STEEL, HEAT TREATMENT OF

**Critical Point.** Changes in Property through Heat Treatment Below Critical Point (Eigenschaftsänderungen durch Wärmebehandlung unterhalb der Umwandlungspunkte). Georg Welter. Stahl u. Eisen, vol. 43, no. 43, Oct. 25, 1923, pp. 1347-1349, 2 figs. Losses through faulty annealing; influence of annealing temperature and duration on mechanical properties of steel wire; constant and gradual cooling in furnace; theoretical conclusions.

**Hardening.** Nitrogen in Iron, Steel and Special Steel. A New Surface Hardening Process (Stickstoff in Eisen, Stahl und Sonderstahl. Ein neues Oberflächenhärtungsverfahren). Ad. Fry. Stahl u. Eisen, vol. 43, no. 40, Oct. 4, 1923, pp. 1271-1279, 17 figs. Nitration stages of pure iron; structure of iron-nitrogen and iron-nitrogen-carbon systems; development of diagram of state; process of shrinkage-free surface hardening by means of nitration.

**Heating and Cooling.** Effect of. Changes in Structure Due to Heating and Cooling of Iron with the Aid of Hot Etchings (Beobachtungen über Gefügeänderungen beim Erhitzen und Abkühlen des Eisens mit Hilfe von Heissätzungen). P. Oberhoffer and A. Heger. Stahl u. Eisen, vol. 43, no. 42, Oct. 18, 1923, pp. 1322-1323, 3 figs. Report from Met. Inst. of Tech. Acad. of Aix-la-Chapelle.

**Mass, Effect on.** The effect of Mass on Heat Treatment. R. S. Gosrow. Forging—Stamping—Heat Treating, vol. 9, no. 10, Oct. 1923, pp. 447-449, 3 figs. Heating and cooling of nickel chrome steel forgings and their physical properties as result of heat treatment.

**Quenching Properties.** Quenching Properties of Very Soft Steel (Sur la faculté de trempe de l'acier extra-doux à très haute température). M. Sauvageot and H. Delmas. Académie des Sciences—Comptes Rendus, vol. 176, no. 17, Apr. 23, 1923, pp. 1146-1148. Results of measurement of mechanical properties when a steel containing 0.09 per cent C. was quenched in water at temperatures varying between 950 deg. cent. and melting point; describes experiments on annealing material quenched at high temperatures.

**Stainless.** Heat-treatment of Steel with Special Reference to Production. J. W. Urquhart. Machy. (Lond.), vol. 23, no. 577, Oct. 18, 1923, pp. 85-87, 1 fig. Stainless steel and iron treatment; forging temperature; hardening and tempering; non-scaling of high-chromium steels; strength of chromium steels after treatment; chrome and useful treatment limit; acid-proof chromes.

**Tractor Parts.** Heat Treating in a California Tractor Plant. Am. Mach., vol. 59, no. 19, Nov. 8, 1923, pp. 679-681, 5 figs. Illustrations of equipment used, its capacity, and work done; steels used, fuels and way in which work is handled.

#### STEEL, HIGH-SPEED

**Heat Treatment.** Hints on Treating High Speed Steel and Its Use for Machining Operations. West. Machy. World, vol. 14, no. 10, Oct. 1923, pp. 320-321 and 323, 3 figs. Discusses forging, annealing, hardening, and drawing of high-speed steel, and importance of careful heating; illustrations of turning and grooving operations of rolls in machine shop of Columbia Steel Co., Pittsburg, Cal.

#### STEEL MANUFACTURE

**Cold-Worked Steel.** The Manufacture of Cold-worked Steel. Machy. (Lond.), vol. 23, nos. 575, 576 and 577, Oct. 4, 11, and 18, 1923, pp. 1-9, 33-38 and 70-71, 23 figs. Methods employed by Kayser, Ellison & Co., Sheffield, England, in production of wire, bar and strip from high-grade crucible and electric alloy steels.

#### STREET RAILWAYS

**Cars.** A Brill New Single Truck. Tramway & Ry. World, vol. 54, no. 19, Oct. 18, 1923, pp. 209-211, 4 figs. Describes 79-E-X truck made by J. G. Brill Co.; carries body, without increasing wheelbase, in such a manner as to give it stability equal to another 1 ft. 6 in. wheelbase.

A Modern Street Car (Ein moderner Strassenbahnwagen). Jos. Westhues. Verkehrstechnik, vol. 40, no. 36, Sept. 7, 1923, pp. 309-313, 10 figs. Dimensions and details of car type designed for Krefeld street railway; design is based on all experiences made in last 10 years and on standards issued by standard committees of Assn. German Street and Narrow-Gage Railways.

# Manufactured by Advertisers **CLASSIFIED LIST OF MECHANICAL EQUIPMENT** Alphabetical List on page 168

**Valves, Air, Automatic**

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**Double-End Pay-as-You-Pass Car Introduced in Brooklyn.** Elec. Ry. J., vol. 62, no. 17, Oct. 27, 1923, pp. 739-742, 7 figs. Details of new front-entrance center-exit car of Brooklyn City Railroad, 200 of which are being placed in service; novel scheme of exterior painting attracts attention; variable load brakes and electro-pneumatic door control used.

**Street-Railway Cars.** Elec. Ry. J., vol. 62, no. 13, Sept. 29, 1923. Contains following articles: Broad Trend of Car Development, pp. 473-474; Present Body Design Tendencies, pp. 475-481, 8 figs.; Facilities for Expediting Passenger Movement, pp. 482-490, 23 figs.; New Methods in Body Construction, pp. 491-501, 25 figs.; Advances in Car Lighting, Heating and Ventilating, pp. 502-510, 17 figs.; Mechanical and Electrical Equipment, pp. 511-519 and 536, 30 figs.; Interchangeability and Standardization, pp. 520-522, 2 figs.; Incorporating Merchandising Features in Design, pp. 523-528, 10 figs.; Cars for Use in Train Operation, pp. 529-536, 14 figs.

**The Application of the Light-Weight Double-Truck Car.** H. C. Hickock. Elec. J., vol. 20, no. 10, Oct. 1923, pp. 356-360, 5 figs. Describes two typical light-weight cars as examples which have successfully met conditions for which they were built.

**Track.** Concrete Foundations, Robert B. Holt. Tramway & Ry. World, vol. 54, no. 19, Oct. 18, 1923, pp. 219-222, 2 figs. Consideration of strength, suitability and permanence of concrete foundations for tramway tracks. Mixing water; grading of aggregates; characteristics of sand; proper maturing; trass or puzzolana; ciment fondu.

## STRESSES

**Optical and Mechanical Determination.** The Determination of Stresses at a Point in a Plate, E. G. Coker. Engineering, vol. 116, no. 3016, Oct. 19, 1923, pp. 512-514, 6 figs. Comparison of experimental methods for obtaining stress at point in plate by optical and mechanical methods. Communicate to Brit. Assn.

**Optical Recorders.** Optical Stress-Strain Recorders. Engineer, vol. 136, no. 3540, Nov. 2, 1923, pp. 479-480. Discusses Dalby's device which, in its present form, consists of two mirrors mounted on axes at right angles to each other, whereby ray of light from point source is reflected through lens and focused on photographic plate.

## SUPERHEATED STEAM

**Developments.** Superheating, John Neill. Inst. Mar. Engrs.—Trans., vol. 35, Oct. 1923, pp. 288-320 and (discussion) 320-329, 35 figs. Deals with recent developments.

## SURGE TANKS

**Spillway Combined with.** Surge Tank and Spillway Combined on Pit River Plant No. 1. Eng. News-Rec., vol. 91, no. 16, Oct. 18, 1923, pp. 630-632, 4 figs. Heavily reinforced cylinder 60 ft. in diam. provides 1800 sec.-ft. spillway capacity between tunnel and penstock.

# T

## TERMINALS, LOCOMOTIVE

**Design.** Locomotive Terminals. West. Soc. Engrs.—Jl., vol. 28, no. 9, Sept. 1923, pp. 373-390 and (discussion) 390-394, 2 figs. Contains following papers: Operating Department Requirements, R. N. Beggs; Mechanical Department Requirements, L. K. Silcox; Design of Railway Locomotive Terminals, W. T. Krausch.

## TERMINALS, RAILWAY

**Chicago Union Station.** The Chicago Union Station, Its Design and Construction, J. D'Esposito. West. Soc. Engrs.—Jl., vol. 28, no. 9, Sept. 1923, pp. 357-372, 7 figs. Records important features of planning and execution of work embraced in general rearrangement of railway facilities known as Chicago Union Station project.

**Design and Developments.** Railroad Terminals. Am. Soc. Civil Engrs.—Proc., vol. 49, no. 7, Sept. 1923, pp. 1455-1606, 61 figs. Symposium containing following papers: Principles of Terminal Station Design, Alfred Fellheimer; Railroad Freight Terminal Problem in St. Louis, Missouri, Charles E. Smith; Street Development in Relation to Railroad Terminals, Jacob L. Crane, Jr.; Chicago Terminal Improvements, Illinois Central Railroad, D. J. Brumley; Chicago Terminal Improvements, Dearborn Station Group, Frederick E. Morrow; Chicago Terminal Improvements, Chicago, Rock Island and Pacific and New York Central Railways, Robert H. Ford; Chicago Union Station Development, J. D'Esposito; Modern Rail and Water Terminals with Reference to Chicago, Rufus W. Putnam; Modern Freight Terminal of the Pennsylvania Railroad System in Chicago, Ill., William L. R. Haines.

**Freight.** New Freight House Provides Special Service. Ry. Age, vol. 75, no. 18, Nov. 3, 1923, pp. 803-806, 7 figs. Layout and facilities of Union Pacific terminal at Los Angeles.

## TEXTILE MILLS

**Electric Drive.** Motor Drive in Old Mills, H. W. Reding. Textile World, vol. 64, no. 14, Oct. 6, 1923, pp. 85, 87, 89, 119 and 121, 3 figs. Proportion of electrically driven spindles in southern States; varied power problems in mills; drives and methods of applying motors; typical layout in recently electrified mill; cost of applying motors in old mill; source of power and steam for processes.

## THREADING MACHINES

**Double-End.** New Double-End Threading Machine Operates Automatically. Automotive Industries, vol. 49, no. 16, Oct. 18, 1923, pp. 792-793, 2 figs. Has capacity for work up to 1/4 in. in diam. and 10 in. length; work fed intermittently from magazine at rear to position in line with die heads; power transmission through two-step cone pulley; built by Grant Mfg. & Machine Co.

## TIDAL POWER

**Utilization.** The Utilization of Tides for the Production of Power for the Working and Lighting of Ports and for Maritime Works (Working of Lock-Gates, etc.), Alejandro Yanquez. World Ports, vol. 11, no. 11, Sept. 1923, pp. 48-55. Points out that when constructing works of ports, construction should be studied of closed docks and moles, with view to forming at one and same time perfect shelters and utilization of natural power of tides. Paper before Int. Congress of Navigation, London.

## TINPLATE

**Manufacture.** The Tinplate Trade: Modern Machinery, H. Spence Thomas. South Wales Inst. Engrs.—Proc., vol. 38, no. 8, Sept. 26, 1923, pp. 669-689 and (discussion) 689-721, 8 figs. Developments in tinplate manufacture in England.

## TIRES, RUBBER

**Balloon.** International Balloon Tire and Rim Standards Are Proposed, Colin Macbeth. Automotive Industries, vol. 49, no. 19, Nov. 8, 1923, pp. 949-952, 7 figs. Points out that disadvantages of existing straight side and clincher equipment can be overcome by adoption of drop base popular in Europe; narrow seats tend to make diameter larger.

**Fabric Stresses in.** Fabric Stresses in Pneumatic Tires, H. F. Schippel. Indus. & Eng. Chem., vol. 15, no. 11, Nov. 1923, pp. 1121-1131, 26 figs. Mathematical analysis of fabric stresses in pneumatic-tire carcasses.

**Types for 1924.** Tyres for 1924. Autocar, vol. 51, no. 1461, Oct. 19, 1923, pp. 711-713, 7 figs. Advent of cushion tires; results obtained with latest design of cord cover in racing and touring.

## TOLERANCES

**German Standards.** German Standards for Tolerances and Allowances in Machine Fits, Oscar R. Wikander. Am. Mach., vol. 59, nos. 19 and 20, Nov. 8 and 15, 1923, pp. 685-689 and 733-737, 12 figs. Presents standard sheets known as Dinorms issued by German Indus. Standards Committee. See also no. 21, Nov. 22, pp. 761-763, 3 figs.

**Large.** Large Tolerances; Their Influence on Determining the Dimensions of Structural Parts (Grosztoleranzen; ihr Einfluss auf die Massbestimmung von Konstruktionsteilen), Th. Damm. Werkstattstechnik, vol. 17, no. 19, Oct. 1, 1923, pp. 555-570, 14 figs. Investigation, based on examples of machine and especially locomotive construction, to determine extent to which principles of German standard fit system (DIN) can be applied to the determinations of large tolerances.

## TOOL MAKING

**Standards for.** The Manufacture of Tools and Fixtures (Die Werkzeugmacherei und der Vorrichtungsbau), Karl Haase. Werkstattstechnik, vol. 17, nos. 17 and 18, Sept. 1 and 15, 1923, pp. 513-520 and 553-556, 20 figs. Economic production by means of special tools and fittings with aid of corresponding Standards. Presents Standard sheets for various fittings.

## TRANSPORTATION

**Railway.** Railroad Transportation. Am. Soc. Civil Engrs.—Proc., vol. 49, no. 7, Sept. 1923, pp. 1406-1454, 8 figs. Symposium containing following papers: Some Phases of Present-Day Railroad Transportation, John W. Kendrick; Transportation as Related to National Development, J. G. Sullivan; Railroads—The Arteries of Commerce, J. Rowland Bibbins; Federal Valuation of Railroads, Charles A. Morse; Consolidation of Railroads, John S. Worley.

## TUBES

**Butt Welding.** Minimizing Distortion in Welding of Tubing, Marcel Piette. Can. Machy., vol. 30, no. 15, Oct. 11, 1923, pp. 22 and 24, 5 figs. Expansion of pieces in opposite sense beneficial; hammering during process on thick material and after welding on thin material diminishes contraction. Translated from Revue de la Soudure Autogene.

## TUBING

**Chrome-Molybdenum Steel.** Physical Properties of Chrome-Molybdenum Steel Tubing, S. W. Thompson. Air Service Information Circular, vol. 5, no. 445, Aug. 1, 1923, 16 pp., 11 figs. Investigation to determine variation in physical characteristics of three sizes of chrome-molybdenum steel tubing after quenching and drawing.

# V

## VALVE GEARS

**Small Turbines.** Valve Gears on Small Westinghouse Direct-Driven Turbines. Power, vol. 58, nos. 19 and 20, Nov. 6 and 13, 1923, pp. 730-731, and 770-773, 6 figs. Describes two general types, one for sets up to 15 kw. which uses horizontal governor mounted on shaft, and second type which is applied to geared turbines and utilizes comparatively low-speed vertical governor geared to slow-speed shaft.

## VAPORS

**Pressure Measurements.** Applications of Vapor Pressure Measurements, H. S. Davis and Mary D. Davis. Indus. & Eng. Chem., vol. 15, no. 10, Oct. 1923, pp. 1075-1077, 1 fig. Vapor-pressure apparatus consists of two similar glass flasks connected to manometer tube and means whereby sealed glass containers full of liquids may be broken inside flasks; details of manipulation of such a device.

## VIBRATIONS

**Tests.** Determination of Mechanical Performance by Means of Vibration Tests, C. Bethel. Elec. J., vol. 20, no. 10, Oct. 1923, pp. 371-373, 5 figs. Results of tests show great value of reproducing service vibrations experimentally to determine ability of piece of apparatus to meet actual service requirements.

## VISCOSIMETERS

**Standardization.** The Standardization of Commercial Viscosimeters, Madison L. Sheely. Indus. & Eng. Chem., vol. 15, no. 11, Nov. 1923, pp. 1109-1114, 9 figs. Discusses need of standardization and advisability of expressing results in absolute units; gives calibration, set up, and operation of typical glass out-flow type of viscosimeter, together with comparisons of various other similar types; data showing comparative results of viscosity determinations on various instruments; liquids and solutions suitable for standardization of commercial types of viscosimeters.

# W

## WAGES

**Incentive Systems.** Wage-Incentive Systems, Eugene Bouton. Soc. Automotive Engrs.—Jl., vol. 13, no. 5, Nov. 1923, pp. 380-383, 6 figs. Describes system involving group-piece-work plan for major assembly units and machining departments, and straight individual piece work for small parts; piece-work prices are established from data obtained in elemental time study, record of which is shown.

**Wage-Incentive Plans for Cost Control.** R. W. Darnell. Management & Administration, vol. 6, no. 4, Oct. 1923, pp. 459-466. Points out that properly planned wage-incentive system not only enables manufacturer to know exactly what his direct labor costs should be but if they exceed this enables him to tell just where increased cost was incurred, or its cause.

**International Rates.** International Rates of Wages in the Engineering Industry, Hugh Quigley. Beama, vol. 13, no. 67, Nov. 1923, pp. 278-284. Position of Britain in international competition.

## WATER ELEVATORS

**Developments.** Recent Developments in Water Elevators, G. C. Gowlland. Roy. Engrs. J., vol. 37, no. 3, Sept. 1923, pp. 389-394, 5 figs. Describes canvas belt, Chaine-Hélke and Boulton water elevators.

## WEIGHTS AND MEASURES

**Length Measurements.** Precise Length Measurements, J. E. Sears. Roy. Soc. Arts—Jl., vol. 71, nos. 3698, 3699 and 3700, Oct. 5, 12 and 19, 1923, pp. 775-791, 793-818 and 819-841, 49 figs. Oct. 5: Control of basic standards. Oct. 12: Determination of derived standards. Oct. 19: Practical applications.

## WELDING

**Apparatus, London Exhibition.** British Welding Exhibition, Lorn Campbell, Jr. Welding Engr., vol. 8, no. 10, Oct. 1923, pp. 23-25, 6 figs. Report of welding exhibitions at Shipping, Engineering and Machinery Exhibition recently held at London, Eng.

**Applications.** Industrial Applications of Welding and Cutting and Their Possibilities, Am. Welding Soc.—Jl., vol. 2, no. 10, Oct. 1923, pp. 9-45, 38 figs. Possibilities of welding as a fabricating process and in repair field; describes applications of arc welding, electric arc cutting, oxy-acetylene welding, oxy-acetylene cutting, resistance welding, and thermit welding.

**Piping, Power-Plant.** The Use of Welding in Power-Plant Piping, Lewis J. Storzini. Power, vol. 58, no. 21, Nov. 20, 1923, pp. 798-802, 12 figs. Results of author's experiences in extensive use of welded piping installations.

**Processes.** The Present Status of Welding Processes (Der gegenwärtige Stand der Schweißverfahren). Zeit. des Bayerischen Revisions-Vereins, vol. 27, nos. 14, 15 and 16, July 31, Aug. 15 and 31, 1923, pp. 105-106, 115-117 and 124-125. Fire, water-gas, thermit, electric, and autogenous welding processes.

[See also ELECTRIC WELDING, ARC; ELECTRIC WELDING, RESISTANCE; OXY-ACETYLENE WELDING.]

## WINDMILLS

**Drive for Dynamo.** Wind-Driven Electric Lighting Plant. Engineering, vol. 116, no. 3018, Nov. 2, 1923, p. 571, 5 figs. Describes Lambert plant, consisting of wind wheel carried at top of lattice mast and driving a dynamo through chain gear.

**Theory.** General Theory of Windmills, Max M. Munk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 164, Oct. 1923, 7 pp., 2 figs. Discusses application of slip-curve method to design and analysis of windmills.

## WORKMEN'S COMPENSATION

**Legislation, United States and Canada.** Workmen's Compensation Legislation of the United States and Canada 1920 to 1922, Lindley D. Clark. U. S. Bur. of Labor Statistics—Bul. (Workmen's Insurance & Compensation Series) no. 332, June 1923, 260 pp. Workmen's compensation laws of United States and Canada.

# For a full flow of clean water BRASS PIPE is necessary

*This picture was taken in a laundry—one of the wettest businesses we know of. Tremendous quantities of water are used every day, and to keep it clean—free from rust—Brass Pipe is employed throughout.*

**W**ATER is measured by meters with works of Brass or Bronze, water is controlled by Brass or Bronze fitted valves, and in the washroom—or the bath at home—the water flows from Brass faucets, plain or nickeled.

Why not go the whole way—have the piping also of Brass? Then you may be sure that every quart of water is clean and usable—that there will be no flakes of rust from the piping to destroy the seating of valves, make faucets leak and make the water unusable and costly. Nor will there be rust-clogged, weakened or leaky piping to replace.

*This picture shows what happens when Brass is not used where it should be used. The rusty ooze you see dribbling down the side of the machine comes from the iron coupling between the main Brass feed line and the washer. Notice the makeshift employed to keep the rusty ooze out of the washer itself.*

**COPPER & BRASS**  
RESEARCH ASSOCIATION

25 Broadway • New York.

**Brass Pipe is cheaper because  
you pay for it only ONCE**

# THE ENGINEERING INDEX

(Registered United States, Great Britain and Canada)

**THE ENGINEERING INDEX** presents each month, in conveniently classified form, items descriptive of the articles appearing in the current issues of the world's engineering and scientific press of particular interest to mechanical engineers. At the end of the year the monthly installments are combined along with items dealing with civil, electrical, mining and other branches of engineering, and published in book form, this annual volume having regularly appeared since 1906. In the preparation of the Index by the engineering staff of The American Society of Mechanical Engineers some 1200 technical publications received by the Engineering Societies Library (New York) are regularly reviewed, thus bringing the great resources of that library to the entire engineering profession.

Photoprint copies (white printing on a black background) of any of the articles listed in the Index may be obtained at a price of 25 cents a page. When ordering photoprints identify the article by quoting from the Index item: (1) Title of article; (2) Name of periodical in which it appeared; (3) Volume, number, and date of publication of periodical; (4) Page numbers. A remittance of 25 cents a page should accompany the order. Order should be sent to the Engineering Societies Library, 29 West 39th Street, New York.

(See also page 112 of this issue for supplementary items.)

## ABRASIVE WHEELS

**Bond Tenacity.** Grinding Wheel Bond Tenacity, Robert J. Spence. Abrasive Industry, vol. 4, no. 12, Dec. 1923, pp. 351 and 355. Function of bonding material, and effects of varying work and wheel speeds.

**Types.** Notes on Abrasives and Abrasive Wheels, W. E. Murphy. Machy. (Lond.), vol. 23, no. 581, Nov. 15, 1923, pp. 207-208. Natural and artificial abrasives; rubber-bonded and silicate wheels.

## AERONAUTICAL INSTRUMENTS

**Control Indicator.** Reid Control Indicator for Aeroplanes, J. Robinson. J. of Sci. Instruments, Preliminary Number, May 1922, pp. 22-24, 3 figs. Describes control indicator having indications of bubble, turn indicator and air speed indicator in one compact case, indications of bubble and turn indicator being in form of lights, red, white or green.

**Height of Aircraft from Ground.** The Measurement of True Height by Aneroid. L. N. G. Filon. J. of Sci. Instruments, vol. 1, no. 1, Oct. 1923, pp. 1-8, 3 figs. Deals with devices for obtaining approximately true height of aircraft from ground, on assumption that law of temperature is approximately known, of class which retains present mechanism but enables pointer to read correct height (without a calculating device) on a special type of dial; describes two types of dial which give a direct reading of "lapse-rate" height with considerable accuracy.

## AERONAUTICS

**Bibliography.** Bibliography of Aeronautics 1917-1919, Paul Brockett. Nat. Advisory Committee for Aeronautics, 1923, 494 pp. Covers literature published from Jan. 1, 1917, to Dec. 31, 1919, and continues work of Smithsonian Miscellaneous Collections covering material published prior to June 30, 1909, and work of Nat. Advisory Committee published in Bibliography of Aeronautics for years 1909 to 1916.

## AIR COMPRESSORS

**Automatic Electric Drive.** Automatic Electric Drive of Medium-Size Piston Compressors (Selbsttätiger elektrischer Betrieb mittlerer Kolbenkompressoren), R. Rückert. Fördertechnik u. Frachtverkehr, vol. 16, nos. 21 and 22, Nov. 3 and 18, 1923, pp. 242-243 and 249-252, 11 figs. Describes automatic device for starting without load developed by German Gen. Elec. Co. (AEG), and its field of application; it is shown that highest degree of efficiency is obtained from compressed-air plant with use of this device.

**Multitubular Isothermal.** Multitubular Isothermal Compressors (Les compresseurs multitubulaires isothermiques et leurs applications), L. Neu. Revue de l'Industrie Minière (Comptes Rendus), no. 66, Sept. 15, 1923, pp. 189-196, 2 figs. Points out that isothermal compression involves expenditure of much less energy than is required for diabatic compression, and avoids practical difficulties associated with temperature rise; by substituting multitubular cylinders and pistons for those of ordinary compressor, output can be increased 20 per cent for same power consumption.

## AIR PUMPS

**Water-Jet.** Adaptability of Water-Jet Air Pumps for the Removal of Air from Surface Condensers (Eigenschaften der Wasserstrahl-Luftpumpen für das Entfernen von Oberflächenkondensatoren), Fritz L. Richter. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 45, Nov. 10, 1923, pp. 1042-1045, 7 figs. Results of experiments made with water-jet apparatus driven by pressure water to determine absorption of dry as well

as moisture-containing air; based on these experimental results and well as those of Höfer with steam-jet apparatus, it is shown how both apparatus behave when removing air from surface condensers; utilization of exhaust steam from both apparatus.

## AIRCRAFT

**Launching from Ships.** The Launching of Aircraft from Ships, L. J. Wackett. Roy. Aeronautical Soc.—Jl., vol. 27, no. 155, Nov. 1923, pp. 553-556, 1 fig. Investigation to find minimum propeller thrust necessary to enable aircraft (particularly seaplane or flying boat) of known weight and fineness, to take off from railway platform, on ship steaming at given speed.

## AIRCRAFT CONSTRUCTION MATERIALS

**Wing Coverings.** Experiments with Fabrics for Covering Airplane Wings, to Determine Effect of Method of Installation, A. Pröll. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 168, Dec. 1923, 49 pp., 23 figs. Notes relating primarily to effect of changes in loading and in disposition of supporting framework (regarded as rigid) on covering fabric. Translated from Technische Berichte, vol. 3, no. 6.

## AIRPLANE PROPELLERS

**Slipstream, Effect of.** Reduction in Efficiency of Propellers Due to Slipstream, Max M. Munk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 170, Dec. 1923, 6 pp. Simple method of calculation. Translated from Technische Berichte, vol. 3, no. 7.

**Tests, Analysis of.** Analysis of W. F. Durand's and E. P. Lesley's Propeller Tests, Max M. Munk. Nat. Advisory Committee for Aeronautics—Report, no. 175, 1923, 14 pp., 22 figs. Critical study of propeller model tests with view of obtaining clear insight into mechanism of propeller action and of examining soundness of physical explanation generally given.

## AIRPLANES

**Air Resistance.** Air Resistance Measurements on Actual Airplane Parts, C. Wieselsberger. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 169, Nov. 1923, 16 pp., 21 figs. Data relate to following experimental objects: Landing gear of Siemens-Schuckert DI airplane; landing gear of "Luftfahrzeug-Gesellschaft" airplane, type Roland D11a; Landing gear of "Flugzeugbau Friedrichshafen" G airplane; machine gun; exhaust manifold of 260-hp. engine. Translated from Technische Berichte, vol. 3, no. 7.

**Chinese-Built.** The "Schoettler I" Biplane. Flight, vol. 15, no. 44, Nov. 1, 1923, pp. 675-676, 3 figs. Describes 2-seater tractor biplane fitted with 160-hp. Mercedes water-cooled engine built by German engineer in China at the Lunggha aerodrome.

**Flying Boats.** See FLYING BOATS.

**Handasyde.** The Handasyde Light 'Plane. Flight, vol. 15, no. 38, Sept. 20, 1923, pp. 563-566, 13 figs. A miniature monoplane, with wing resting on top of fuselage and pilot placed in a cut-out portion of trailing edge; fuselage of rectangular section terminating at stern in a horizontal knife-edge; 750 cc. Douglas flat-twin air-cooled engine; length 19 ft. 2 in., span 30 ft.

**Heinkel.** A New German Airplane (Eine neue deutsche Flugzeugkonstruktion), Alex. Büttner. Motorwagen, vol. 26, no. 28, Oct. 10, 1923, pp. 421-422, 1 fig. Small strutless monoplane built entirely of wood which can be used as land or seaplane; designed

and built by Heinkel Airplane Works, Warnemünde known as Type H. E. 3.

**Internally Braced.** Design of Internally Braced Biplane Wings, A. S. Niles. Air Service Information Circular, vol. 5, no. 440, May 1, 1923, 31 pp., 15 figs. Describes properties of internally braced biplanes and indicates proper method of design.

**Light.** Gliders and Light Planes, A. Ogilvie. Roy. Aeronautical Soc.—Jl., vol. 27, no. 155, Nov. 1923, pp. 524-528 and (discussion) 528-534. Author discusses results which may be looked for from light plane; he believes it should be possible to develop propeller system which would enable full power of engine to be effectively used from time it is opened up, give steep angle to climb, be efficient at top speed and at same time act as air brake when gliding down without engine.

The English Light Plane Meeting at Lympe. Aviation, vol. 15, no. 21, Nov. 19, 1923, pp. 622-625, 2 figs. Performances: Speed, 70.5 mi.-hr.; ceiling, 14,400 ft.; economy, 87.5 mi.-gal.; details of competing planes.

The Light 'Plane Competitions at Lympe, Oct. 8-13. Flight, vol. 15, nos. 40 and 41, Oct. 4 and 11, 1923, pp. 602-611, 26 figs., and 618-628, 20 figs. Description of machines entered, and account of performances.

**Racers.** The Avus Race and Its Airplanes (Das Avus-Rennen und seine Fahrzeuge), Motorwagen, vol. 26, no. 29-30, Oct. 20-31, 1923, pp. 431-432. Description of participating machines and their behavior during race at Berlin-Grunewald race track.

**Seaplanes.** See SEAPLANES.

**Sport.** The Albatros Sporting Types L. 59 and L. 60. Flight, vol. 15, no. 37, Sept. 13, 1923, pp. 543-544, 2 figs. Notes on a single-seater, with 50-60-hp. Siemens radial engine, known as type L. 59, and a two-seater, with 90-100-hp. engine of same make known as type L. 60.

**Stability.** The Problem of the Stability of Airplanes (Le problème de la stabilité des avions), L. Breguet and R. Devillers. Technique Moderne, vol. 15, no. 19, Oct. 1, 1923, pp. 577-582, 6 figs. Clarifying discussion of fundamental principles involved.

**Training.** A Belgian Airplane (Un avion belge), A. Renard. Association des Ingénieurs Sortis de l'Ecole Polytechnique de Bruxelles, vol. 19, no. 1, 1923, pp. 3-19, 12 figs. Details of an improved 90-hp. biplane designed especially for training purposes, but easily capable of performing all "stunt" evolutions.

**Variable Gearing.** The Effect of Variable Gearing on Aeroplane Performance, Annie D. Betts. Roy. Aeronautical Soc.—Jl., vol. 27, no. 155, Nov. 1923, pp. 557-560. Author states that it appears to be possible to construct combination of variable gear and airscrew which will allow of machine being flown at nearly constant speed at all heights, while engine revolutions are kept at (or close to) any chosen value.

**Vickers.** The Vickers "Vigot" Light 'Plane. Flight, vol. 15, no. 38, Sept. 20, 1923, pp. 559-562, 15 figs. Perfectly orthodox biplane, using normal bracing and having R. A. F. 15 wing section; 750-cc. Douglas flat twin air-cooled engine; length 17 ft. 3 in., height 7 ft. 3 in.

**Wind-Tunnel Tests.** Wind Tunnel Tests of Five Strut Sections in Yaw, Edward P. Warner. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 167, Nov. 1923, 13 pp., 6 figs. Models were made at McCook Field and tested in old wind tunnel of Mass. Inst. of Technology.

# Classified List of Mechanical Equipment

## Manufactured by Firms Represented in MECHANICAL ENGINEERING

FOR ALPHABETICAL LIST OF ADVERTISERS, SEE PAGE 140

- Accumulators, Hydraulic**  
 \* Farrel Foundry & Machine Co.  
 \* Mackintosh-Hemphill Co.  
 \* Worthington Pump & Mchry. Corp'n
- Aftercoolers, Air**  
 \* Ingersoll-Rand Co.
- Air Compressors, Receivers, etc.**  
 (See Compressors, Receivers, etc., Air)
- Air Conditioning Apparatus**  
 \* American Blower Co.  
 \* Carrier Engineering Corp'n  
 \* Clarage Fan Co.  
 \* Sturtevant, B. F. Co.
- Air-Jet Lifts**  
 \* Schutte & Koerting Co.
- Air Washers**  
 \* American Blower Co.  
 \* Carrier Engineering Corp'n  
 \* Clarage Fan Co.  
 \* Cooling Tower Co. (Inc.)  
 \* Spray Engineering Co.  
 \* Sturtevant, B. F. Co.
- Alloys**  
 \* Driver-Harris Co.
- Alloys (Calite)**  
 \* Calorizing Co.
- Ammeters**  
 \* Bristol Co.  
 \* General Electric Co.  
 \* Westinghouse Electric & Mfg. Co.  
 \* Weston Electrical Instrument Co.
- Anemometers**  
 \* Taylor Instrument Cos.  
 \* Weber, F. Co. (Inc.)
- Annealing**  
 \* American Metal Treatment Co.
- Arches, Boiler Furnace**  
 \* Liptak Fire-Brick Arch Co.  
 \* McLeod & Henry Co.  
 \* Titusville Iron Works Co.
- Arches, Fire Door**  
 \* McLeod & Henry Co.
- Arches, Ignition (Flat Suspended)**  
 \* Combustion Engineering Corp'n  
 \* Liptak Fire-Brick Arch Co.  
 \* McLeod & Henry Co.
- Asbestos Products**  
 \* Carey, Philip Co.  
 \* Johns-Manville (Inc.)
- Autoclaves**  
 \* Farrel Foundry & Machine Co.
- Axles, Car**  
 \* Fuller-Lehigh Co.
- Babbitt Metal**  
 \* Medart Co.  
 \* Westinghouse Electric & Mfg. Co.
- Ball Bearings, Gages, etc.**  
 (See Bearings, Gages, Ball)
- Balls, Brass and Bronze**  
 \* Gwilliam Co.
- Balls, Steel**  
 \* Atlas Ball Co.  
 \* Gwilliam Co.  
 \* New Departure Mfg. Co.  
 \* S K F Industries (Inc.)
- Barometers**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Taylor Instrument Cos.
- Barometers, Mercurial**  
 \* Tagliabue, C. J. Mfg. Co.
- Bearings, Ball**  
 \* Fafnir Bearing Co.  
 \* Gurney Ball Bearing Co.  
 \* Gwilliam Co.  
 \* New Departure Mfg. Co.  
 \* Norma Co. of America  
 \* S K F Industries (Inc.)  
 \* U. S. Ball Bearing Mfg. Co.
- Bearings, Radial Thrust**  
 \* New Departure Mfg. Co.
- Bearing, Roller**  
 \* Gwilliam Co.  
 \* Hyatt Roller Bearing Co.  
 \* Norma Co. of America  
 \* Royersford Fdry. & Mach. Co.  
 \* Timken Roller Bearing Co.
- Bearings, Self-Oiling**  
 \* Brown, A. & F. Co.  
 \* Doehler Die-Casting Co.
- Bells Clutch & Machinery Co.**  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Royersford Fdry. & Mach. Co.  
 \* Wood's, T. B. Sons Co.
- Bearings, Thrust**  
 \* Fafnir Bearing Co.  
 \* General Electric Co.  
 \* Gwilliam Co.  
 \* Norma Co. of America  
 \* S K F Industries (Inc.)  
 \* Timken Roller Bearing Co.  
 \* U. S. Ball Bearing Mfg. Co.
- Belt Dressing**  
 \* Dixon, Joseph Crucible Co.
- Belt Lacing, Steel**  
 \* Bristol Co.
- Belt Tighteners**  
 \* Brown, A. & F. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Medart Co.  
 \* Smith, F. L. & Co.  
 \* Wood's, T. B. Sons Co.
- Belting, Canvas (Stitched)**  
 \* United States Rubber Co.
- Belting, Conveyor**  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.
- Belting, Elevator**  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.
- Belting, Leather**  
 \* American Sole & Belting Leather Tanners (Inc.)
- Belting, Rubber**  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.
- Benches, Work**  
 \* Manufacturing Equip. & Engrg. Co.
- Bending & Straightening Machines**  
 \* Long & Allstatler Co.
- Bends, Pipe**  
 \* Frick Co. (Inc.)  
 \* Vogt, Henry Machine Co.
- Billets, Steel**  
 \* Timken Roller Bearing Co.
- Bleaching Machinery**  
 \* Philadelphia Drying Mchry. Co.
- Blocks, Tackle**  
 \* Clyde Iron Works Sales Co.  
 \* Roebing's, John A. Sons Co.
- Blowers, Centrifugal**  
 \* American Blower Co.  
 \* Clarage Fan Co.  
 \* De Laval Steam Turbine Co.  
 \* General Electric Co.  
 \* Ingersoll-Rand Co.  
 \* Kerr Turbine Co.  
 \* Sturtevant, B. F. Co.  
 \* Westinghouse Electric & Mfg. Co.
- Blowers, Fan**  
 \* American Blower Co.  
 \* Clarage Fan Co.  
 \* Green Fuel Economizer Co.  
 \* Sturtevant, B. F. Co.
- Blowers, Forge**  
 \* Sturtevant, B. F. Co.
- Blowers, Pressure**  
 \* American Blower Co.  
 \* Clarage Fan Co.  
 \* Lammert & Mann Co.  
 \* Sturtevant, B. F. Co.
- Blowers, Rotary**  
 \* Fletcher Works  
 \* Lammert & Mann Co.  
 \* Schutte & Koerting Co.  
 \* Sturtevant, B. F. Co.
- Blowers, Soot**  
 \* Diamond Power Specialty Corp'n  
 \* Sturtevant, B. F. Co.
- Blowers, Steam Jet**  
 \* Schutte & Koerting Co.
- Blowers, Turbine**  
 \* Sturtevant, B. F. Co.
- Blueing (Metal)**  
 \* American Metal Treatment Co.
- Boards, Drawing**  
 \* Dietzgen, Eugene Co.  
 \* Keuffel & Esser Co.  
 \* ParVell Laboratories  
 \* Weber, F. Co. (Inc.)
- Boiler Baffles**  
 \* King Refractories Co. (Inc.)  
 \* McLeod & Henry Co.
- Boiler Compounds**  
 \* Dixon, Joseph Crucible Co.  
 \* Unisol Mfg. Co.
- Boiler Coverings, Furnaces, Tube Cleaners, etc.**  
 (See Coverings, Furnaces, Tube Cleaners, etc., Boiler)
- Boiler Fronts**  
 \* Brownell Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.
- Boiler Settings, Steel Cased**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* McLeod & Henry Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.
- Boilers, Heating**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Herbert Boiler Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.
- Boilers, Locomotive**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.
- Boilers, Marine (Scotch)**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Leffel, James & Co.  
 \* Titusville Iron Works Co.  
 \* Walsh & Weidner Boiler Co.
- Boilers, Marine (Water Tube)**  
 \* Babcock & Wilcox Co.  
 \* Casey-Hedges Co.  
 \* Connelly, D. Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Springfield Boiler Co.  
 \* Titusville Iron Works Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Ward, Charles Engineering Wks.
- Boilers, Portable**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Frick Co. (Inc.)  
 \* Herbert Boiler Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.
- Boilers, Tubular (Horizontal Return)**  
 \* Bigelow Co.  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Cole, R. D. Mfg. Co.  
 \* Connelly, D. Boiler Co.  
 \* Erie City Iron Works  
 \* Herbert Boiler Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Webster, Howard J.  
 \* Wickes Boiler Co.
- Boilers, Tubular (Vertical Fire)**  
 \* Bigelow Co.  
 \* Brownell Co.
- Boilers, Water Tube (Horizontal)**  
 \* Babcock & Wilcox Co.  
 \* Casey-Hedges Co.  
 \* Cole, R. D. Mfg. Co.  
 \* Connelly, D. Boiler Co.  
 \* Edge Moor Iron Co.  
 \* Erie City Iron Works  
 \* Herbert Boiler Co.  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Springfield Boiler Co.  
 \* Union Iron Works  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Wickes Boiler Co.
- Boilers, Water Tube (Inclined)**  
 \* Babcock & Wilcox Co.  
 \* Bigelow Co.  
 \* Casey-Hedges Co.  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Ward, Charles Engineering Wks.
- Boilers, Water Tube (Vertical)**  
 \* Babcock & Wilcox Co.  
 \* Bigelow Co.  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Wickes Boiler Co.
- Boxes, Carbonizing**  
 \* Driver-Harris Co.
- Boxes, Case Hardening**  
 \* Driver-Harris Co.
- Boxes, Water Service**  
 \* Murdock Mfg. & Supply Co.
- Brake Blocks**  
 \* Johns-Manville (Inc.)
- Brakes, Air**  
 \* Allis-Chalmers Mfg. Co.  
 \* General Electric Co.
- Brass Goods**  
 \* Scovill Mfg. Co.
- Brass Mill Machinery**  
 \* Farrel Foundry & Machine Co.
- Breechings, Smoke**  
 \* Brownell Co.  
 \* Morrison Boiler Co.  
 \* Titusville Iron Works Co.  
 \* Vogt, Henry Machine Co.
- Brick, Fire**  
 \* Bernitz Furnace Appliance Co.  
 \* Celite Products Co.  
 \* Drake Non-Clinkering Furnace Block Co.  
 \* Keystone Refractories Co.  
 \* King Refractories Co. (Inc.)  
 \* McLeod & Henry Co.
- Brick Insulating**  
 \* Celite Products Co.  
 \* Quigley Furnace Specialties Co.
- Bridges, Coal & Ore Handling**  
 \* Brown Hoisting Machinery Co.  
 \* Link-Belt Co.
- Bridgewalls (Furnace)**  
 \* McLeod & Henry Co.
- Buckets, Elevator**  
 \* Brown Hoisting Machinery Co.  
 \* Chain Belt Co.  
 \* Gifford-Wood Co.  
 \* Hendrick Mfg. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.
- Buckets, Grab**  
 \* Brown Hoisting Machinery Co.  
 \* Clyde Iron Works Sales Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**AIRSHIPS****Hangars.** See HANGARS.**Metal- vs. Fabric-Clad.** Metal-Clad versus Fabric-Covered Rigid Airships, R. Upson. *Aviation*, vol. 15, no. 24, Dec. 10, 1923, pp. 702-703. Points out that metal envelope has advantage of fire-resisting quality, greater gas tightness, durability and lesser weight.**Photoelastic Tests.** Photoelastic Method Applied to Rigid-Airship Research, Thos. H. Frost. *Soc. Automotive Engrs.—Jl.*, vol. 13, no. 6, Dec. 1923, pp. 497-498, 2 figs. Account of photoelastic tests carried out at Mass. Inst. of Technology on model of ZR1, to determine stress distribution with ship in flight.**Water-Ballast Recovery.** Water Ballast Recovery for Airships, Ira F. Fravel. *Aviation*, vol. 15, no. 21, Nov. 19, 1923, pp. 625-626, 2 figs. History of development; describes condenser developed by Bur. of Standards and Army Air Service, which consists of series of long slender pipes or tubes through inside of which gas is conducted on its way from exhaust manifolds of engine to atmosphere.**Zeppelin.** The Zeppelin Passenger Airship LZ, 126. *Engineer*, vol. 136, no. 3545, Dec. 7, 1923, pp. 604-605, 9 figs. partly on supp. plate and p. 616. Constructional details of airship approaching completion in works of Zeppelin Co., Friedrichshafen, Germany.**ALIGNMENT CHARTS****Graphic Utilization.** Simple Method for Graphic Utilization of Alignment Charts Without Calculation (Einfaches Verfahren zur zeichnerischen Auswertung von Liniendiagrammen ohne Rechnung). Paul Ertl. *Zeit. für das Berg-, Hütten- u. Salinenwesen*, vol. 71, no. 2, 1923, pp. 175-179, 2 figs. Describes method developed by author for determination of derived values from basic values.**ALLOY STEELS****Automobile Construction.** Steels for Automobile Construction (Kraftwagen-Baustähle). Motor u. Auto, vol. 20, no. 18, Sept. 25, 1923, pp. 156-159. Describes special steels manufactured by Böhrer Bros. & Co., with special reference to nickel and chrome-nickel steels.**Fracture.** Faults in Alloy Steel (Ueber Fehlstellen in legiertem Stahl), A. Schleicher. *Stahl u. Eisen*, vol. 43, no. 47, Nov. 22, 1923, pp. 1449-1452. It is shown that fractures known as flasks are due to presence of solid oxide slag enclosures.**Krupp.** Krupp Steels for Tools and Steel Products (Krupps Stähle für Werkzeuge und Stahlwaren), H. Schilling. *Kruppsche Monatshefte*, vol. 4, July-Aug. 1923, pp. 123-132, 7 figs. History of their development; recent developments in manufacture of tool and alloy steels.**ALLOYS****Aluminum.** See ALUMINUM ALLOYS.**Bearing Metals.** See BEARING METALS.**Brass.** See BRASS.**Cast.** The Use of Cast Alloys for the Working Parts of Machinery, Pisek. *Foundry Trade Jl.*, vol. 28, nos. 374, 375 and 376, Oct. 18, 25 and Nov. 1, 1923, pp. 325-329, 349-351 and 369-376, 61 figs. Physical properties of alloys; cooling considerations; influence of impurities and overheating; liquation; physical changes by alloying; how metals solidify; deoxidizers; contraction; piping and blowholes; alloys of copper; deoxidizing copper alloys; brasses; aluminum bronzes; anti-friction alloys; aluminum alloys. From paper presented to Paris Int. Foundry conference.**Chrome - Molybdenum.** Chrome - Molybdenum and Chrome-Molybdenum-Copper Alloys (Ueber Chrom-Molybdän- und Chrom-Molybdän-Kupfer-Legierungen), E. Siedschlag. *Zeit. für anorganische u. allgemeine Chemie*, vol. 131, no. 2, Oct. 1923, pp. 191-202, 3 figs. Results of investigations.**Ferroalloys.** See FERROALLOYS.**Solid Solutions.** The Modern Concept of Solid Solutions, Zay Jefferies and R. S. Archer. *Chem. & Met. Eng.*, vol. 29, nos. 21 and 22, Nov. 19 and 26, 1923, pp. 923-926 and 966-969, 4 figs. How they are visualized by metallurgist; presentation of working information regarding constitution and properties of alloys.**ALUMINUM ALLOYS****Constitution and Age Hardening.** The Constitution and Age-Hardening of the Quaternary Alloys of Aluminum, Copper, Magnesium, and Magnesium Silicide, Marie L. V. Gayler. *Inst. Metals—advance paper*, no. 6, for meeting Sept. 10-13, 1923, 28 pp., 22 figs. Constitution of ternary alloys at 400 deg. cent., and of quaternary alloys of aluminum with magnesium silicide and copper and magnesium in definite ratio; age hardening of quaternary alloys.**Ship Castings.** Aluminum and Aluminum Alloys for Use on Board Ship, E. M. Hewlett and D. Basch. *Am. Soc. Naval Engrs.—Jl.*, vol. 35, no. 4, Nov. 1923, pp. 675-692, 4 figs. on supp. plates. Discusses casting alloys.**Transformations and Thermal Treatment.** A Dilatometric Study of the Transformations and Thermal Treatment of Light Alloys of Aluminum, A. M. Portevin and Pierre Chevenard. *Inst. Metals—advance paper*, no. 12, for meeting Sept. 10-13, 1923, 19 pp., 12 figs. Application of dilatometric methods, judiciously using recording differential dilatometer, permits of study of transformations and mechanism of heat treatment of light alloys of aluminum-magnesium-silicon, and, in general, of alloys containing two-phase, univariant transformations, a study which had not been carried out up to present.**ALUMINUM BRONZE****Properties and Uses.** Aluminum-Bronze. Metal*Industry (Lond.)*, vol. 23, no. 23, Dec. 7, 1923, pp. 505-508, 3 figs. Surveys essential features in general constitution and properties and deals with practical problems in founding and working of principal alloys of series; industrial uses.**Special.** Special Aluminum Bronzes (Les bronzes d'aluminium spéciaux), Léon Guillet. *Revue de Métallurgie*, vol. 20, nos. 2 and 4, Feb. and Apr. 1923, pp. 130-138 and 257-261, 27 figs. Microscopic study; mechanical properties; critical points; heat treatment; variation of mechanical properties as a function of temperature; determination of resistance, density, elongation and other physical properties. Feb.: Copper-aluminum-nickel alloys. Apr.: Phosphor-magnesium- and cobalt-aluminum bronzes.**AMMONIA****Specific Heat.** Specific Heat of Superheated Ammonia Vapor, N. S. Osborne, H. F. Stimson, T. S. Slight, Jr. and C. S. Cragoe. *Refriger. Eng.*, vol. 10, no. 5, Nov. 1923, pp. 145-168, 18 figs. Series of measurements which is one of group of experimental investigations of thermodynamic behavior of superheated ammonia vapor; aim has been to obtain calorimetric data for superheated vapor comparable in accuracy with results of other experimental measurements of group, so that consistent tables might be formulated which would agree throughout with experimental data.**APPRENTICES, TRAINING OF****Building Trades, Boston.** Apprenticeship in the Building Trades of Boston, Wm. S. Parker, Geo. Thornton, Heywood S. French and Jas. M. Gauld. *Boston Soc. Civ. Engrs.—Jl.*, vol. 10, no. 9, Nov. 1923, pp. 381-403 and (discussion) 403-410. Subject is discussed from viewpoint of architect, contractor and labor group.**AUTOMOBILE ENGINES****Carburetors.** See CARBURETORS.**Torsional Oscillations in.** Torsional Oscillations in Automotive Engines and Their Experimental Investigation (Dreheschwingungen bei Fahrzeugmotoren und deren experimentelle Untersuchung), J. Geiger. *Zeit. des Vereines deutscher Ingenieure*, vol. 67, no. 47-48, Nov. 24, 1923, pp. 1077-1078, 14 figs. Rotational oscillations as causes of fracture in crankshafts; report on mechanical recording of extremely rapid oscillations up to 60,000 per min.; pressure fluctuations in mixture inlet as cause of slow torsional fluctuations of shaft.**AUTOMOBILE FUELS****Benzol.** An Australian Motor Spirit. *Indus. Australian & Min. Standard*, vol. 70, no. 1821, Oct. 25, 1923, pp. 628-629, 3 figs. Fully-equipped plant for recovery of benzol has been installed at Newcastle works of Broken Hill Proprietary Co. as an adjunct to coke-oven plant and company is now in position to place on Australian market 1,250,000 gal. annually.**Benzol vs. Gasoline.** Gasoline or Benzol (Benzin oder Benzol), H. Typke. *Wirtschaftsmotor*, vol. 5, no. 7, July 25, 1923, pp. 12-13. Discusses standpoints for judgment of what may be termed high-grade fuel; volumetric unit; maximum output; efficiency, and price; judged by these factors, author concludes that superiority of benzol for German conditions is established.**Gasoline.** See GASOLINE.**Latent Heat.** Equilibrium Boiling-point and Latent Heat of Vaporization of Motor Fuels, W. R. Ormandy and E. C. Craven. *Instn. Petroleum Technologists—Jl.*, vol. 9, no. 39, Oct. 1923, pp. 368-379, 1 fig. Results of investigations; calculations of latent heats for various mixtures.**Miles per Gallon, Increasing.** What the Automotive and Oil Industries Can Do for Each Other, H. L. Horning. *Am. Petroleum Inst.—advance paper*, for meeting Dec. 11-13, 1923, 14 pp. Points out that it is possible to double miles per gallon of gasoline and lubricating oil on cars, trucks, and in general, by small cost in design.**Mixed.** The National Motor Fuel: Study of the Possible Constitution (Le carburant national: Etude sur sa constitution possible), C. Legrand. *Chimie & Industrie*, vol. 10, no. 3, Sept. 1923, pp. 411-428, 12 figs. Study of an extensive series of binary, ternary and quaternary mixtures of alcohol, benzol, gasoline and ether, with reference to their stability and satisfactory functioning as internal-combustion engine fuels.**Volatility.** Economic Motor-Fuel Volatility, S. W. Sparrow. *Am. Petroleum Inst.—advance paper*, for meeting Dec. 11-13, 1923, 16 pp. Deals with fuel investigation being conducted by Bur. of Standards in cooperation with Soc. Automotive Engrs., Nat. Automobile Chamber of Commerce, and Am. Petroleum Inst.; results obtained since Dec. 1922.**AUTOMOBILE MANUFACTURING PLANTS****American.** What About Automobile Shops? A. L. DeLeeuw and K. H. Condit. *Am. Mach.*, vol. 59, nos. 18, 19, 20 and 21, Nov. 1, 8, 15 and 22, 1923, pp. 643-645, 683-684, 723-724 and 753-754. Present conditions in American industry. Nov. 8: Drilling operations. Nov. 15: Lack of uniformity in shop practice. Nov. 22: Present and future development of new machines.**Machine Tools for.** Equipping an Ideal Automobile Plant, A. L. DeLeeuw. *Am. Mach.*, vol. 59, no. 23, Dec. 6, 1923, pp. 825-827. Author suggests types of machine tools new to automobile industry, such as magazine feeds, combination machines with rotating tables, non-adjustable standard-type machines and standard unit combinations.**AUTOMOBILES****American Improvements.** American-Built Products Predominate at Automobile Salon. *Automotive**Industries*, vol. 49, no. 20, Nov. 15, 1923, pp. 1004-1006, 6 figs. American exhibits at automobile salon in New York. Special bodies with dummy radiator shown on Franklin chassis; Minerva adds front-wheel brakes.**Bodies.** Coachwork at the Show. *Autocar*, vol. 51, no. 1464, Nov. 9, 1923, pp. 963-973, 43 figs. Brief descriptions of bodies of exhibits at Olympia (Lond.) annual automobile exhibition, Nov. 2-10, 1923, arranged in alphabetical order. See also *Auto-Motor Jl.*, vol. 28, no. 45, Nov. 8, 1923, pp. 990-991, 5 figs.**Brakes.** Bureau of Standards Makes Definite Checks on Brake Performance, Herbert Chase. *Automotive Industries*, vol. 49, no. 22, Nov. 29, 1923, pp. 1092-1096, 8 figs. Relative effectiveness of various arrangements and operating means are graphically recorded; use of front-wheel type does not double rate of deceleration, surprising values for friction coefficient between tire and road obtained.**Four-Wheel Brake Adoptions Generate Sharp Discussion in England.** M. W. Bourdon. *Automotive Industries*, vol. 49, no. 21, Nov. 22, 1923, pp. 1051-1057, 16 figs. Perrot type, with modifications, most widely used by British makers; other technical trends shown at Olympia Show.**Four-Wheel Brakes.** *Autocar*, vol. 51, no. 1466, Nov. 23, 1923, pp. 1061-1065, 14 figs. Surveys methods of application and operation.**British Show.** A Detailed Consideration of the More Interesting Exhibits of Olympia Show. *Automobile Engr.*, vol. 13, no. 183, Nov. 22, 1923, pp. 354-384, 127 figs. Detailed consideration of more interesting exhibits, including lighting and starting equipment, frames, clutches and clutch couplings, gear boxes, rear axles, springs and suspension, front axles, steering, and front wheel brakes.**The Motor Exhibition at Olympia.** *Engineering*, vol. 116, nos. 3018, 3019 and 3020, Nov. 2, 9 and 16, 1923, pp. 567-568, 584-589 and 613-619, 72 figs. partly on supp. plates. Review of exhibits. See also *Engineer*, vol. 116, nos. 3540, 3541 and 3542, Nov. 2, 9 and 16, 1923, pp. 469-471, 496-500 and 506, and 528-529, 28 figs.**Daimler and B. S. A.** New Daimler and B. S. A. Range. *Autocar*, vol. 51, no. 1463, Nov. 2, 1923, pp. 821-823, 6 figs. Inclusion of a fast 35-hp. car with 4-wheel brakes and a wide selection of silent-running open and closed carriages.**Elgin.** New Elgin Has Automatic Gear Shaft and Four-wheel Brakes. *Automotive Industries*, vol. 49, no. 22, Nov. 29, 1923, pp. 1106-1107, 5 figs. Standard equipment includes semi-balloon tires and air cleaner; only open model is specially equipped sport car; all body types are mounted on chassis of 118-in. wheel-base; power plant is Falls 6-cylinder, valve-in-head engine.**Essex.** Six-Cylinder Essex Car is Announced by Hudson. *Automotive Industries*, vol. 49, no. 24, Dec. 13, 1923, pp. 1191-1193, 6 figs. New power plant is L-head type, with bore and stroke of 2 1/2 by 4 in., providing piston displacement of 130 cu. in.; special body mounting and arrangement of spring suspension give low center of gravity.**European.** Cars at Foreign Automotive Association Show Combine Utility and Luxury. *Automotive Industries*, vol. 49, no. 20, Nov. 15, 1923, pp. 997-1003, 21 figs. Tendency away from bonnets which are wider at cowl than at radiator; further attempts made to give lower bodies; arm rests, dividing rear seats, popular; chassis changes. Foreign exhibits shown at importers' salons in New York.**Farman.** The 37.2 Hp. Farman Car. *Auto-Motor Jl.*, vol. 28, no. 47, Nov. 22, 1923, pp. 1025-1028, 7 figs. Six-cylinder monobloc-cast engine; overhead valves, operated by overhead camshaft, latter driven by vertical shaft in vertical housing in front of engine; front-wheel brakes.**German.** The Small Grade Automobile (Der Kleine Grade-Wagen), Paul Kahn. *Motorwagen*, vol. 26, no. 29-30, Oct. 20-31, 1923, pp. 433-435, 3 figs. Equipped with air-cooled two-cycle, two-cylinder, 16-hp. engine.**German Show.** Automobiles at the German Automobile Show (Die Kraftwagen auf der Deutschen Automobil-Ausstellung), R. C. V. Gorissen. *Allgemeine Automobil-Zeitung*, vol. 24, nos. 39, 40, 41, 42-43 and 44, Oct. 2, 6, 11, 26 and Nov. 6, 1923, pp. 27-30, 26-28, 18-22, 18-19 and 17-18, 4 figs. Details of exhibits.**The German Automobile Show 1923 (Vorschau der Deutschen Automobil-Ausstellung 1923),** Rich. Hofmann. *Automobil-Rundschau*, vol. 22, no. 9, Sept. 1923, pp. 93-100, 12 figs. Details of exhibits of automobiles, motor trucks, motorcycles, engines and parts.**Guy.** The New 2-Litre Guy. *Autocar*, vol. 51, no. 1463, Nov. 2, 1923, p. 825, 2 figs. Data on 1924 model which embodies 4-door bodies, 4-speed gear box, 4-wheel brakes and a 4-cylinder engine.**Lighting and Starting Systems.** Electric Lighting and Starting Systems. *Autocar*, vol. 51, no. 1464, Nov. 9, 1923, pp. 987-991, 12 figs. Descriptions of exhibits at Olympia (Lond.) annual automobile exhibition, Nov. 2-10, 1923.**Locomobile.** Oil Lubricated Floating Cam Features Locomobile Front Wheel Brake, Herbert Chase. *Automotive Industries*, vol. 49, no. 20, Nov. 15, 1923, pp. 994-995, 3 figs. Forward pair is equalized and no unlocking occurs in rounding curves; design similar to Isotta type in most respects.**London Show.** The Automobile Show. *Autocar*, vol. 51, no. 1464, Nov. 9, 1923, pp. 963-963, 244 figs. Brief descriptions of car and chassis exhibits at Olympia (Lond.) annual exhibition, Nov. 1-10, 1923, arranged in alphabetical order. See also *Auto-Motor Jl.*, vol. 28, no. 45, Nov. 8, 1923, pp. 965-987, 93 figs.See also *British Show*.**Packard.** The Packard Single-Eight, J. G. Vincent and W. R. Griswold. *Soc. Automotive Engrs.—Jl.*, vol. 13, no. 6, Dec. 1923, pp. 485-489 and (discussion)

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

489-492, 5 figs. Two appendices supplementing article published in *Journal*, Oct. 1923, giving mathematical analyses.

**Paris Show.** Automobile and Motorcycle Show at Paris (Le XVIII<sup>e</sup> Salon de l'Automobile et du Cycle), G. Delanche. *Génie Civil*, vol. 83, nos. 16, 17 and 18, Oct. 20, 27 and Nov. 3, 1923, pp. 361-375, 401-409 and 424-439, 105 figs. Description of touring-car exhibits; special systems of transmissions, suspensions and brakes.

**Rollin.** Small Bore, Long Stroke Engine Feature of New Rollin. *Automotive Industries*, vol. 49, no. 23, Dec. 6, 1923, pp. 1137-1139, 2 figs. 4-wheel brakes and balloon tires are standard equipment; 4-bearing crankshaft used; pistons and connecting rods made of aluminum alloy; chassis has 112-in. wheelbase.

**Spring Action and Vibration.** Spring-Movement and Vibration Study of Cars in Action, T. J. Little, Jr. *Soc. Automotive Engrs.—Jl.*, vol. 13, no. 6, Dec. 1923, pp. 445-449, 5 figs. Describes device that combines recording seismograph and spring-action recorder, which is essential in conducting investigations; methods governing use of device when studying spring action and chassis vibration.

**Taxicabs.** Paris Taxicabs Use Four-Wheel Brakes Built under Serex License, W. F. Bradley. *Automotive Industries*, vol. 49, no. 24, Dec. 13, 1923, pp. 1213-1215, 6 figs. Patents include three distinct types; tests carried out at Brooklands track show good performance.

**Three-Wheeler.** Three Wheels Versus Four, R. M. Sanders. *Sci. Am.*, vol. 129, no. 6, Dec. 1923, pp. 386-387, 8 figs. Points out advantages of three-wheeler, as manufactured in Europe, over its predecessor, the motorcycle-and-sidecar combination; direction in which development of economy car is pointed.

**Valve-Tappet Parts, Machining.** Manufacturing Automobile Valve Tappet Parts. *Machy.* (N. Y.), vol. 30, no. 4, Dec. 1923, pp. 282-286, 15 figs. Intensive methods employed at plant of Hudson Motor Car Co. in attaining high production rates with standard machine tools.

**Wheel Alignment.** Motor-Vehicle Wheel-Alignment, J. F. Duby. *Soc. Automotive Engrs.—Jl.*, vol. 13, no. 6, Dec. 1923, pp. 453-458 and (discussion) 458-460, 4 figs. Explains method for obtaining correct alignment that will insure easy steering and cause least amount of tire wear; front-wheel and rear-wheel alignment requirements; analysis of "toe-in" and "camber" and manner of determining them; axle tilt and wheel wobble.

## AVIATION

**Developments, United States.** Comments on Aviation—Naval and Commercial, E. S. Land. *Soc. Nav. Architects & Mar. Engrs.—advance paper*, no. 2, for meeting Nov. 7-8, 1923, 7 pp. Review of developments in United States during year.

**Engineering Work, Employment in.** The Aeroplane in Engineering, L. D. Hutton. *Min. & Metallurgy*, vol. 4, no. 204, Dec. 1923, pp. 607-611, 3 figs. Air mapping for geological reconnaissance; air reconnaissance for railroads; air-location of metallurgical works; accuracy of aerial traverse tested; applications to forestry; air transportation.

## B

### BALANCING MACHINES

**Eötvös Torsion.** The Eötvös Torsion Balance and Its Application to the Finding of Mineral Deposits, Stephen Kybár. *Economic Geology*, vol. 18, no. 7, Oct.-Nov. 1923, pp. 639-662, 15 figs. Discusses method developed by Eötvös by means of potential theory; describes variometer and its application to determination of subterranean disturbances. Bibliography on publications of Eötvös on subject.

### BEARING METALS

**Nickel in, Effect of.** The Effect of Small Quantities of Nickel upon High-Grade Bearing Metal, A. H. Munday and C. C. Bissett. *Inst. Metals—advance paper*, no. 9, for meeting Sept. 10-13, 1923, 5 pp., 5 figs. Result of practical investigation into mechanical and wearing properties of bearing metal of well-known grade, after addition of small but increasing amounts of nickel.

### BEARINGS, ROLLER

**Bridge.** Recommendation for a Standard Bridge Bearing (Vorschlag für ein einheitliches Brückenlager), J. Karig. *Bautechnik*, vol. 1, nos. 38, 40-41 and 43, Sept. 7, 21 and Oct. 5, 1923, pp. 357-360, 416-420 and 429-433, 32 figs. Based on years of experience author makes recommendation for an economical roller bearing; discusses basic form of bearing; permissible stresses; bearing pressures; calculation of rollers; roller base and cover plate; head plate; recommendation for sizes of bearings; special forms; calculation.

### BLAST-FURNACE GAS

**Purification by Electric Filter.** The Electric Filter Experimental Station for the Purification of Blast-Furnace Gas at the Rhénish Steel Works in Duisburg-Meiderich (Die Elektrofilter-Versuchsanlage zur Reinigung von Hochofengas auf den Rheinschen Stahlwerken in Duisburg-Meiderich), H. Lent. *Stahl u. Eisen*, vol. 43, no. 48, Nov. 29, 1923, pp. 1467-1471 and (discussion) 1471-1474, 4 figs. Fundamentals of electric gas purification; review of literature; tests of Siemens-Schuckert Works; difficulties with hot gas; results of tests at experimental stations of Rhénish Steel Works; conclusions.

### BOILER FEEDWATER

**Deaerating.** Lowering Oxygen in Water Reduces

Corrosion, Chas. E. Colborn. *Power Plant Eng.*, vol. 27, no. 24, Dec. 15, 1923, pp. 1225-1226, 1 fig. Laws governing amount of gas water will dissolve and means of deaerating water.

**Feed Meters.** The Testing of Boiler-Feed Meters. *Power Engr.*, vol. 18, no. 213, Dec. 1923, pp. 457-459, 5 figs. General methods adopted by Glenfield & Kennedy.

**Treatment.** Cost Analysis of Feed Water Softening, Allen F. Brewer. *Elec. Light & Power*, vol. 1, no. 11, Nov. 1923, pp. 17-19 and 75-77, 10 figs. Water-softening methods; discusses items of expense in plant operation which would be affected by installation of feedwater purifying system; other determining factors.

**Internal Treatment of Boiler Water—Proper and Improper.** D. K. French. *Indus. & Eng. Chem.*, vol. 15, no. 12, Dec. 1923, pp. 1239-1243. Study of internal treatment applied directly in boiler for correction of difficulties encountered in steam production; reactions in boiler; principles on which treatments act; discusses proprietary compounds which have done so much to discredit this method of treatment.

### BOILER FURNACES

**Air-Supply Regulation.** The Expediency of Regulated Air Supply for Fuel Economy (Nutzen geregelter Verbrennungsluftzufuhr für sparsame Brennstoffwirtschaft), H. Schwarz. *Archiv für Wärme-wirtschaft*, vol. 4, no. 9, Sept. 1923, pp. 172-173, 1 fig. Describes automatic apparatus for regulating air supply for combustion.

**Combustion Systems.** Factors in the Choice of a Combustion System, E. B. Ricketts. *Power Plant Eng.*, vol. 27, no. 23, Dec. 1, 1923, pp. 1194-1196. Points out that future selection of firing methods will lie between stoker, pulverized fuel and low-temperature coal distillation.

**Low-Grade Anthracite.** Investigations of Furnaces with Special Regard to Low-Grade Anthracite (Feuerungsuntersuchungen mit besonderer Berücksichtigung minderwertiger Steinkohle), H. Ebel. *Wärme*, vol. 46, nos. 40, 41, 42 and 43, Oct. 5, 12, 19 and 26, 1923, pp. 439-442, 451-454, 462-465 and 472-474, 15 figs. Sources of losses with low-grade anthracite; principles of combustion; hydrogen losses; apparent and actual excess of air; heat generated per cu. m. flue gas; producible heat, carbon losses, quality and calorific efficiency of furnaces; heat balances, flue-gas volume and chimney losses.

### BOILER HOUSES

**Efficiency.** The Importance of the Boiler House, David Brownlie. *Eng. & Boiler House Rev.*, vol. 37, no. 4, Oct.-Nov. 1923, pp. 93-94. Discusses present inefficiency due to design and equipment of plant and methods of controlling working of plant, and gives suggestions for improvements.

### BOILER OPERATION

**Flue Cleaning.** Boiler Flue Cleaning by Suction. *Eng. & Boiler House Rev.*, vol. 37, no. 4, Oct.-Nov. 1923, pp. 111-112, 1 fig. Brief description of plant designed by British Vacuum Cleaner & Eng. Co., Ltd.; illustrates one method of application.

### BOILER ROOMS

**Losses in, Prevention of.** The Prevention of Boiler Room Losses, Jas. T. Beard. *2nd. Indus. Management* (N. Y.), vol. 66, no. 6, Dec. 1923, pp. 355-360, 5 figs. Discusses causes of losses and methods of prevention.

### BOILERS

**Coal Mines.** Advance in Steam-Boiler Practice in Anthracite Region, M. M. Rice. *Coal Age*, vol. 24, no. 21, Nov. 22, 1923, pp. 767-772, 4 figs. Importance of burning small sizes of coal at mines; changes in boiler and furnace design to obtain efficient combustion; benefits of high stacks.

**Corrosion.** Boiler Corrosion, W. S. Patterson. *Inst. Mar. Engrs.—Trans.*, Nov. 1923, pp. 348-366, 6 figs. Collation of information, discussing and focusing causes, and suggesting methods of combating corrosion in marine boilers.

**Fireholes.** Notes on the Design of Fireholes of Steam Boilers, A. Wrench. *Ry. Gaz.*, vol. 39, no. 20, Nov. 16, 1923, p. 620, 9 figs. Comments on various methods of construction, their respective advantages and drawbacks.

**Gas Passages, Chart for.** Chart for the Design of Gas Passages, M. E. Yeager. *Power Plant Eng.*, vol. 27, no. 24, Dec. 15, 1923, pp. 1226-1228, 1 fig. Explanation of chart for reading areas of gas passages in boilers and furnaces.

**Hydrostatic Test.** What is the Value of the Hydrostatic Test? Thos. H. Fenner. *Power*, vol. 58, no. 22, Nov. 27, 1923, pp. 851-853. Shows where hydrostatic test can be of great assistance in determining condition of object under examination, and also other cases where it may be detrimental to safety which it seeks to insure.

**Loading.** The Economical Limits of Boiler Loading, Chas. F. Wade. *Elec. Rev.*, vol. 93, no. 2398, Nov. 9, 1923, pp. 687-688. Discusses factors determining upper limits of economical loading of any given plant, namely, available draft power, draft system, labor costs, class and quality of fuel used.

**Locomotive.** See LOCOMOTIVE BOILERS.

**Waste-Heat.** The Clarkson Waste Heat Boiler. *Engineering*, vol. 116, no. 3023, Dec. 7, 1923, pp. 711-713, 7 figs. Can be used to provide abundant supply of hot water, or alternately a useful supply of steam, according to manner in which it is operated; with aid of Clarkson boiler, nearly 60 per cent of waste of engine was recovered.

**Water-Tube.** See BOILERS, WATER-TUBE.

### BOILERS, WATER-TUBE

**Babcock & Wilcox Plant, Australia.** Manufacture

of Boilers, Conveyors, Cranes, Etc. *Indus. Australian & Min. Standard*, vol. 70, no. 1822, Nov. 1, 1923, pp. 666-668, 7 figs. Historical development of water-tube boiler, and relative merits of this type of boiler; description of new works of Babcock & Wilcox, Ltd. at Regent's Park, Sydney, Australia.

**Deformations.** Deformations in Vertical-Tube Boilers While Heating (Formänderungen von Steilrohrkesseln beim Abheizen), Wilhelm Otte. *Zeit. des Vereines deutscher Ingenieure*, vol. 67, no. 44, Nov. 3, 1923, pp. 1021-1023, 12 figs. General discussion; results of measurements and conclusions.

**Spearing.** The Spearing Boiler. *Eng. & Boiler House Rev.*, vol. 37, no. 4, Oct.-Nov. 1923, pp. 99-100, 3 figs. Principal features of Spearing water-tube boiler.

**Tubes, External Cleaning.** External Cleaning of Water Tube Boiler Tubes. *Engr. & Boiler House Rev.*, vol. 37, no. 4, Oct.-Nov. 1923, pp. 105-106, 2 figs. Economy to be effected by regular soot removal from boiler tubes; soot-removing apparatus.

**Water-Circulation and Efficiency Tests.** Water Circulation and Increasing Efficiency of Water-Tube Boilers (Wasserumlauf und Leistungssteigerung der Wasserrohrkessel), H. Maaß. *Zeit. des Bayerischen Revisions-Vereins*, vol. 27, nos. 19 and 20, Oct. 15 and 21, 1923, pp. 145-148 and 156-158, 11 figs. Discusses observations made in operation of highly stressed water-tube boilers and reports on water-surface measurements, water-circulation and efficiency tests on different types of boilers; conclusions and recommendations for design of high-power boilers, based on tests.

**Yarrow Land Type.** Yarrow Land Type Boilers. *Elec. Times*, vol. 64, no. 1673, Nov. 8, 1923, pp. 483-484, 2 figs. Application of Yarrow boiler to central station in Newcastle-upon-Tyne.

### BORING MACHINES

**Multiple-Spindle.** Improvements Made in Boring Machine. *Automotive Industries*, vol. 49, no. 22, Nov. 29, 1923, pp. 1112-1113, 2 figs. Multiple-spindle tool designed for production use; heads are detachable; arranged for either belt or motor drive.

### BRASS

**Corrosion.** Corrosion of Brass as Affected by Grain Size, Rob. J. Anderson and Geo. M. Enos. *Am. Inst. Min. & Met. Engrs.—Trans.*, no. 1282-N, Dec. 1923, 11 pp., 6 figs.; also (abstract) in *Min. & Metallurgy*, vol. 4, no. 204, Dec. 1923, p. 624, 1 fig. Describes series of tests using accelerated electrolytic corrosion test developed by writers in Bur. of Mines; results show that, for brass tested and corrosive solutions used, effect of grain size (from 0.01 to 0.10 mm. diam.) on corrosion loss is very small and probably can be ignored for practical purposes; in general, however, brass with smaller grain size tends to corrode less than that with larger grain size.

### BRASS FOUNDRIES

**Crucibles.** The Care of Brass Foundry Crucibles, C. F. Hopkins. *Metal Industry* (Lond.), vol. 23, no. 21, Nov. 23, 1923, pp. 459-460, 7 figs. Points out importance of proper annealing, treatment of crucibles in furnace; handling crucibles. (Abstract.) Address before Phila. Foundrymen's Assn.

## C

### CALORIMETERS

**Boys.** A General-Purpose Recording Drum, C. V. Boys. *Jl. of Sci. Instruments*, vol. 1, no. 1, Oct. 1923, pp. 26-28, 3 figs. Describes a convenient auxiliary of recording drum for recording continuously volume of a certain quantity of air at the temperature and pressure at the time and saturated with water vapor; developed in connection with integrating and recording gas calorimeter, but modified to be of general application.

**Pressure and Temperature Corrector.** A New Automatic Pressure and Temperature Corrector for Gas Volumes, C. H. Beasley. *Chem. & Industry*, vol. 42, no. 48, Nov. 30, 1923, pp. 457T-459T, 3 figs. Describes improvements made in Beasley recording net value calorimeter and how they were arrived at.

### CAMS

**Machining.** An Ingenious Device for Making a Peculiar Cam, Ellsworth Sheldon. *Am. Mach.*, vol. 59, no. 21, Nov. 22, 1923, pp. 773-775, 3 figs. Describes cams for Rivett grinding machine and device and method of machining them.

### CAR LIGHTING

**Systems.** Principal Systems of Individual Electric Lighting Applied to Railway Cars (Les principaux systèmes d'éclairage électrique individuel appliqué aux voitures de chemins de fer), M. Bouquier. *Electricien*, vol. 37, nos. 1287 and 1288, Nov. 1 and 15, 1921, vol. 38, nos. 1304 and 1310, July 15 and Oct. 15, 1922, and vol. 39, no. 1318, Feb. 15, 1923, pp. 481-488, 505-513, 313-320, 457-464, 75-81, 40 figs. Lighting by candles, oil, electricity and acetylene; systems of individual and of collective electric lighting; voltage of lights and regulation of voltage; dynamos and batteries; Stone, Vicarino and other systems; Rosenberg system and its application to French state railways.

### CARBURETORS

**Design Theory.** Explains Theory Governing Carburetor with Intake Throttle, P. S. Tice. *Automotive Industries*, vol. 49, no. 22, Nov. 29, 1923, pp. 1099-1101, 7 figs. Mixture required to give minimum consumption varies only with inlet pressure due to corresponding dilution of charge with burned products;

# Manufactured by Advertisers **CLASSIFIED LIST OF MECHANICAL EQUIPMENT** **Alphabetical List on page 110**

**Conveyors, Chain**  
\* Brown Hoisting Machinery Co.  
Chain Belt Co.  
Link-Belt Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

design of Stewart-Warner instrument is based on this fact, not on proportioning fuel to air drawn through.

**Heavy-Oil.** Heavy Oil Carburetors at the Berlin Automobile Show (Schwerölbetrieb auf der Berliner Autausstellung). Allgemeine Automobil-Zeitung, vol. 24, no. 40, Oct. 6, 1923, pp. 29-32, 7 figs. Details of engines and carburetors for use of heavy oil.

**Heavy Oils for Automobile Engines** (Schweröle für Automobilmotoren). Automobil-Rundschau, vol. 22, no. 7, July 1923, pp. 66-68, 2 figs. Describes heavy-oil carburetor of the Schiele- & Bruchsaler-Konzern, consisting essentially of two float arrangements with nozzles separated for crude oil and for light oil, and of a vaporizer.

**Kiesel.** The Kiesel Carburetor and Its Operation (Der Kiesel-Vergaser und seine Wirkungsweise). H. Rolfberg. Motor u. Auto, vol. 20, no. 12, June 25, 1923, 5 figs. Details of carburetor in which all functions are combined in a single organ, and its advantages.

#### CARS

**Draft-Gear Closures.** A Mathematical Law of Impact between Cars. E. M. Richards. Ry. Mech. Engr., vol. 97, nos. 11 and 12, Nov. and Dec. 1923, pp. 760-762 and 817-819, 3 figs. Study of time of partial and full-draft gear closures, checked by test results of U. S. R. R. Administration.

#### CARS, PASSENGER

**Building Methods.** Production Methods in British Passenger Car Building. D. R. Lamb. Ry. Rev., vol. 73, no. 22, Dec. 1, 1923, pp. 782-786, 12 figs. Modern production methods in wooden passenger-car building introduced at Derby Works of Lond. Midland & Scottish Ry.; departure in woodworking involves machining to size within extremely close limits.

#### CAST IRON

**Defective Examination of.** The Examination of Defective Ferrous Materials in an Engineering Works. T. Henry Turner. Engineering, vol. 116, no. 3022, Nov. 30, 1923, pp. 698-700, 3 figs. Considers abnormalities which appear from time to time in machine shops of large modern engineering works; deals with cast and wrought materials and methods of overcoming evil effects of defects; laboratory work which discovery of defects entails. Paper read before Birmingham Met. Soc.

**Electric-Furnace Production.** Grey Cast Iron from the Point of View of the Electric Furnace. G. K. Elliott. Foundry Trade J., vol. 28, no. 378, Nov. 15, 1923, pp. 419-420. Main features of acid and basic electric furnaces, and effects of each upon principal elements of cast iron in comparison with effects obtained through cupola; problems of cast iron that have arisen through introduction of electric furnace for treating cast iron. Paper read before Am. Foundrymen's Assn.

**Hardening.** Hardening Cast Iron by Chilling. F. C. Edwards. Metal Industry (Lond.), vol. 23, no. 21, Nov. 23, 1923, pp. 467-468, 2 figs. Author takes particular problems attached to molding and casting of chilled rolls to illustrate main principles concerned.

**High-Grade Low-Carbon.** German Views on Semi-Steel and other High-Grade Low-Carbon Cast-Irons. F. Wust and P. Bardenheuer. Foundry Trade J., vol. 28, no. 378, Nov. 15, 1923, pp. 410-412. Melting in a crucible; mixing of liquid steel and liquid pig iron; melting in an open-hearth furnace; melts made in electric furnace; casts made in cupola. Translated from Die Giesserei.

**Pearlitic.** Tells of Pearlitic Cast Iron. Carl Sipp. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 986-987. Structure of pearlite secured in iron by pouring low-silicon metal into heated molds; claim made for improved physical properties of metal, especially under dynamic tests.

**Strength at High Temperatures.** The Strength of Cast Iron (Semi-Steel Mixtures) at High Temperatures. Arthur Marks. Foundry Trade J., vol. 28, no. 378, Nov. 15, 1923, pp. 421-422, 2 figs. Results of research carried out with a view to investigating cause of failure at high temperatures and upper limiting temperature at which cast iron may be safely used, and to determine temperature at which cast iron mixtures, when heated, showed a rapid drop in strength.

**Tests.** A Consideration of Some Mechanical Tests on Cast Iron. E. Siegle. Foundry Trade J., vol. 28, nos. 379 and 380, Nov. 22 and 29, 1923, pp. 433-436 and 467, 10 figs. Results of shear and transverse tests carried out by author; mechanical properties of hematite and semi-phosphorus irons. Translated from paper presented before Paris Int. Congress.

**Tests on Piping and Shrinkage in Cast Iron.** O. Bauer and K. Sipp. Foundry Trade J., vol. 28, no. 376, Nov. 1, 1923, pp. 376-377, 4 figs. Results of tests carried out to determine effects of silicon, manganese, phosphorus and sulphur on cast iron. Abstract from Stahl u. Eisen.

#### CASTING

**Centrifugal.** Casting Iron Centrifugally. J. A. Rathbone. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 988-990, 2 figs. Piston-ring castings made centrifugally chilled when cast against metal molds and different types of cores were utilized to prevent this action; annealing experiments. Paper presented at Am. Foundrymen's Assn.

#### CENTRAL STATIONS

**Control and Checking System.** Control and Checking Systems for Automatic Stations. R. J. Wensley. Elec. World, vol. 82, no. 21, Nov. 1923, pp. 1062-1064, 5 figs. Apparatus developed for use of system dispatcher in controlling and checking operations in distant automatic generating stations and substations.

**Remote Indicator.** The Cambridge Remote Indicator. Elec. Rev., vol. 93, no. 2396, Oct. 26, 1923, pp. 608-609, 3 figs. By suitable modifications, voltage,

current, power, or power factor can be indicated many miles away, at small cost; system has been in successful operation for five years between two power stations 8 mi. apart. See also Electr., vol. 91, no. 2371, Oct. 26, 1923, pp. 458-459, 6 figs.

**Ventilation.** Ventilation of Electrical Stations. Contract Rec. & Eng. Rev., vol. 37, no. 47, Nov. 21, 1923, pp. 1104-1106, 3 figs. Difficulties of adequately ventilating some types of substation buildings; apparatus necessary; means of exhausting stale air.

#### CHARTS

**Engineering and Business.** Engineering and Business Charts. A. W. Swan. Eng. Production, vol. 6, no. 135, Dec. 1923, pp. 496-500, 12 figs. Classes of chart users; squared paper chart; laying out horizontal and vertical scales; correct use of scales; ratio charts; straight-line chart and its uses; special slide rules and alignment charts.

#### COAL

**B.t.u. Value.** Practical Value of B. Th. U. in Coal. G. A. Rosetti. Practical Engr., vol. 68, no. 1917, Nov. 22, 1923, pp. 289-291. Discusses following point: assuming that facts of test are known and agreed, as to quantity and quality of fuel used, quantity and conditions of evaporation produced, conditions of combustion, etc., what is correct figure for efficiency?

**Specific Heat.** The Specific Heat of Coal and Its Relation to Composition. G. Coles. Chem. & Industry, vol. 42, no. 46, Nov. 16, 1923, pp. 435T-439T, 4 figs. Determinations of specific heat made by means of Bunsen ice calorimeter; results and conclusions.

#### COLD STORAGE

**Fruits and Vegetables.** The Cooling of Fruit and Vegetables in the Cold-Storage Building of Abattoir in Norrköping (Sweden) (Die Kühlung von Obst und Gemüse im Kühlhaus des Schlachthofes zu Norrköping). Zeit. für die gesamte Kälte-Industrie, vol. 30, no. 9, Sept. 1923, pp. 101-105, 13 figs. Results of tests carried out in cold-storage building by L. Rasmussen.

#### COMBUSTION

**Volumetric Representation.** The Volumetric Representation of Combustion Phenomena (Zur räumlichen Darstellung von Verbrennungsvorgängen). Georg Szende. Feuerungstechnik, vol. 12, nos. 1 and 2, Oct. 1 and 15, 1923, pp. 1-4 and 9-13, 7 figs. Relation between three given components of fuel gases is expressed by so-called fuel-gas planes, simple construction of which is shown; fuel-gas planes of different fuels are shown to bear very simple geometrical relations to one another, and their total forms what is known as fuel-gas body, which gives very clear representation of combustion phenomena.

#### COMPRESSED AIR

**Pneumatic Mail Tubes.** Continental Pneumatic Postal Tube Installation. Indus. Management (Lond.), vol. 10, no. 10, Nov. 15, 1923, pp. 283-285, 5 figs. Latest developments of pneumatic appliances employed for postal purposes in city of Munich, Germany. Translated from Zeit. des Vereines deutscher Ingenieure.

#### CONDENSERS, STEAM

**Specifications.** Condenser Specifications and Bids for Detroit Municipal Plant. Power, vol. 58, no. 24, Dec. 11, 1923, pp. 934-936. Presents initial tabulation of condenser bids, illustrating methods employed.

#### CONNECTING RODS

**Production Methods.** Connecting Rod Production Accelerated by Gang System and Good Jigs. W. L. Carver. Automotive Industries, vol. 49, no. 23, Dec. 6, 1923, pp. 1155-1161, 13 figs. Methods in forge and machine shops in production of Jewett connecting rod.

#### CONVEYORS

**Belt.** Conveyor Belts Resist Abrasion of Concrete Mixture. F. W. Kennedy. Belting, vol. 23, no. 5, Nov. 1923, pp. 21-24, 9 figs. Accumulation of concrete on belt prevented by rubber scraper and water jets; Laurel Road dam, under construction near New Canaan, Conn., makes unique use of conveyors.

**Conveyors.** Sci. & Art of Min., vol. 34, no. 7, Oct. 27, 1923, pp. 102-103, 4 figs. Describes band, its advantages and disadvantages; Sutcliffe belt conveyor; suspended through conveyor.

**Chain System.** Conveyor System in Continuous Motion. Iron Age, vol. 112, no. 24, Dec. 13, 1923, pp. 1594-1595, 4 figs. Handled windshield frames into tanks and through ovens without pause; capacity 3000 pieces in 9 hr.; installed in plant of Ternstedt Mfg. Co., Detroit.

**Chemical Works.** The Use of Conveyors in Chemical Works. H. Seymour. Chem. Age (Lond.), vol. 9, no. 232, Nov. 24, 1923, pp. 565-566. Discusses continuous and pneumatic conveyors.

**Collapsible, for Cargo Handling.** Telescopic Power Conveyor for Ship Cargo Handling. G. F. Nicholson. Belting, vol. 23, no. 5, Nov. 1923, pp. 31-32, 1 fig. Collapsible conveyor, it is claimed, will revolutionize vessel freight handling; designer describes equipment; capacity 125 tons per hr.

**Shaking.** The Operation of Shaking Conveyors with the Aid of Auxiliary Cylinders (Der Rutschbetrieb mit Hilfszylindern). J. Soballa. Glückauf, vol. 59, no. 44, Nov. 3, 1923, pp. 1005-1009, 8 figs. Describes design and operation of auxiliary cylinders and arrangement and operation of a conveyor with such cylinders; advantages.

#### CORES

**Corebox Construction.** Large Core Box Construction. Jas. Edgar. Metal Industry, (Lond.) vol. 23, no. 22, Nov. 30, 1923, pp. 491-492, 4 figs. Methods of construction.

**Drying.** The Foundry of Messrs. Morris Motors, Limited, with Special Reference to Continuous Core Drying. Foundry Trade J., vol. 28, no. 381, Dec. 6, 1923, pp. 475-481, 13 figs. Details of foundry specializing exclusively in automobile castings; special feature of which is Lucas continuous core-drying plant.

**Pipe.** Cores and Arbors for Large and Ill-Shaped Pipes. J. F. Mullan. Can. Foundryman, vol. 14, no. 11, Nov. 1923, pp. 20-21, 3 figs. How cores are made for large ill-shaped pipe work; enormous waste-making arbor for each casting; sectional arbor can be removed easily and reassembled.

#### COUPLINGS

**Selection and Application.** Factors Affecting Use of Rigid and Compression Couplings When Employed in Connecting Line Shafting in the Mechanical Transmission of Power in Industrial Works. Frank E. Gooding. Indus. Engr., vol. 81, nos. 10, 11 and 12, Oct., Nov. and Dec. 1923, pp. 499-501 and 517-518; 529-533 and 564; and 579-583 and 590, 37 figs. Oct.: Use of rigid, sleeve, clamp and compression couplings. Nov.: Various types of flexible couplings, their characteristics and applications in connecting shafts of two machines in a direct line or of a driven machine to its driving mechanism. Dec.: Possible sources of trouble in operation attributed to flexible couplings, and considerations to be observed when installing them.

#### COST ACCOUNTING

**Aerial Transportation.** Cost Accounting in Aerial Transportation. Earl D. Osborn. Aviation, vol. 15, no. 21, Nov. 19, 1923, pp. 628-630. Problem of accountant is so to group elements of expense that directors may have clear mental picture of cost; maintenance ledger account; depreciation; miscellaneous accounts; cost records.

**Inventory Methods.** Making Short Work of Inventory Taking. Factory, vol. 31, no. 6, Dec. 1923, pp. 764-766, 4 figs. Plans and ideas used successfully by manufacturers in making inventory period a part of well-managed routine rather than cost confusion once or twice a year.

**Value of.** Is Our Investment in Cost Accounting Profitable? Thos. W. Howard. Factory, vol. 31, no. 6, Dec. 1923, pp. 760-761. Effective use of cost results.

#### CRANES

**Bridge-Erecting.** Large Bridge-Erecting Crane for India. Engineer, vol. 136, no. 3543, Nov. 23, 1923, pp. 566-567, 4 figs. To be used on North-Western Ry. of India for purpose of reconstructing and strengthening number of bridges on that system; total weight is 136 tons.

#### CUPOLAS

**Blast Reheating.** Note on Cupolas (Note sur les cubilots). Fonderie Moderne, vol. 17, Oct. 1923, pp. 337-343, 10 figs. Present status of question of reheating blast before it goes through tuyeres.

**Iron Melting in.** Describes Cupola Reactions. Jaime Coll. Foundry, vol. 51, no. 23, Dec. 1, 1923, pp. 961-962. Reference to and conclusions from contemporary literature on many phases incident to process of melting iron in cupola furnace. (Abstract.) Paper presented before Int. Foundry Congress, Paris.

**Observes Melting in Cupola.** John Grennan. Foundry, vol. 51, no. 22, Nov. 15, 1923, pp. 908-910, 1 fig. Conditions during heat observed through holes in cupola steel indicate melting takes place over extended length depending on variation of sections of stocks. Paper presented before Am. Foundrymen's Assn.

**Schuermann.** Preheat Blast in New Cupola. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 994-996, 3 figs. Arrangement of refractory brick checkerwork conserves heat; blast passes transversely across cupola melting zone; pressure and exhaust fans used in new type of cupola invented by E. Schürmann, Dresden, Germany.

#### CURVES

**Fitting.** Method of Least Squares and Curve Fitting. H. S. Uhler. Optical Soc. Am.—Jl., vol. 7, no. 11, Nov. 1923, pp. 1043-1066. Author exposes certain tacit insidious potential sources of confusion permeating many writings on method of least squares and deduces compact rigorous formulas for all important cases that can arise in adjusting straight line to set of observed points in two dimensions.

D

#### DIE CASTING

**Machines.** Develop Die Casting Machine. E. B. Kreutzberg. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 1000-1001, 2 figs. Device patented by E. N. Dollin, interesting feature of which is valve control apparatus by which air from high-pressure system exhausts into low-pressure system. See also Brass World, vol. 19, no. 11, Nov. 1923, pp. 365-366, 2 figs.

#### DIESEL ENGINES

**Central-Station.** The Economical Operation of Diesel Engine. C. Mendelsohn. Elec. World, vol. 82, no. 19, Nov. 10, 1923, pp. 970-971, 2 figs. Results obtained from Diesel-engine generating plant of two units in Arizona belonging to Old Dominion Co.; each unit comprises vertical 5-cylinder, 2-stroke-cycle Nordberg-Carels Diesel engine, with directly connected 850-kva., 2300-volt, 3-phase, 60-cycle a.c. generator.

**Compressorless.** Compressorless Diesel Engines (Kompressorlose Dieselmotoren). Otto Günther. Motorwagen, vol. 26, nos. 26, 28 and 29-30, Sept. 20, Oct. 10 and 20-31, 1923, pp. 387-392, 423-427 and 437-

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

440, 12 figs. Modern development of Diesel engines with compressor for small and medium-size, slow- and high-speed machines; thermotechnical and economic conditions; recent theories on working process in Diesel engines, ignition-point testing, and combustion; influence of eliminating air of injection; description of principal German and foreign compressorless U-boat engines.

**Crankshaft Fracture.** Report on a Broken Crankshaft on a Diesel Engine at Bridgetown, Barbados, W. C. Shettle. Diesel Engine Users Assn.—advance paper, for meeting Oct. 5, 1923, 9 pp. including discussion, 5 figs. Describes fracture occurring in M. B. & D. 200-b.hp., 4-cylinder engine installed in 1911.

**Marine, Europe.** New European Diesel Experiments. *Pac. Mar. Rev.*, vol. 20, no. 12, Dec. 1923, pp. 574-575, 2 figs. Survey of Diesel engines for marine propulsion in Europe; Diesel engines and plant of M. A. N., Augsburg, Bavaria; British Diesel engines and North British Diesel Engine Co.

## DRAWINGS

**Scheduling and Progress-Recording.** Scheduling and Progress-Recording of Drawings, Irwin Hoffman. *Machy.* (N. Y.), vol. 30, no. 4, Dec. 1923, pp. 296-297, 4 figs. Describes system followed out and developed by writer which has proved successful in drafting rooms of large contracting company.

## DRILLING MACHINES

**Radial.** Improved Universal Radial Drilling Machines. *Machy.* (Lond.), vol. 23, no. 581, Nov. 15, 1923, p. 201, 2 figs. Details of remodeled machines of Midgley & Sutcliffe, Bradford, England. See also description of new radial drilling machine by Scott Bros., Halifax, in same journal, pp. 215-216, 2 figs.

# E

## ECONOMIZERS

**Design.** Status of Economizer Construction and Its Future Development (Stand des Ekonomiserbaues und seine künftige Entwicklung). H. Seeberger. *Wärme*, vol. 49, nos. 42 and 44, Oct. 19 and Nov. 2, 1923, pp. 459-461 and 483-484, 1 fig. Investigation of purpose of economizer; designs and adjustment; injurious effect on strength of economizer through chemical influences, mechanical action and other operative influences; requirements of design to offset these injurious effects.

## ELECTRIC FURNACES

**Alloy-Melting.** Improved Electric Melting Furnace for Alloys, T. F. Bailly. *Chem. & Met. Eng.*, vol. 29, no. 24, Dec. 10, 1923, pp. 1062-1063, 3 figs. New type of radiant dome electric furnace installed in plant of Miller Industries, Canton, O.

## ELECTRIC LOCOMOTIVES

**General Electric Co.** Electric Locomotives for the Paris-Orleans Railway and the Mexican Railway. *Ry. & Locomotive Eng.*, vol. 36, no. 12, Dec. 1923, pp. 380-381, 3 figs. Results of speed tests and description of new type built by Gen. Elec. Co. and Am. Locomotive Co. for French railway; also gives details and test results of new locomotive for Mexican Ry. Co.

**Industrial Plants.** Saving upon Internal Transport, C. S. Darling. *Power Engr.*, vol. 18, nos. 211 and 212, Oct. and Nov. 1923, pp. 370-374 and 414-416, 10 figs. Survey of requirements to be met by satisfactory locomotives for works use and description of typical suitable electric locomotives for this purpose; notes on costs.

**Mexican Railway.** Electric Locomotives for Mexican Railway, G. H. Walker. *Ry. Age*, vol. 75, no. 22, Dec. 1, 1923, pp. 1021-1023, 1 fig. Mechanical details of ten 150-ton 3000-volt d.c. locomotives for initial electrification of Mexican Railway Co., for freight and passenger service between Orizaba and Esparanza.

**Passenger.** Electric Locomotives Tested at Erie. *Elec. Ry. J.*, vol. 62, no. 23, Dec. 8, 1923, pp. 908-970, 2 figs. Dimensions and data of 120-ton Paris-Orleans locomotive designed for high-speed passenger service, and of 150-ton Mexican Railway freight locomotive; Paris-Orleans locomotive developed 105 m.p.h. in preliminary tests; 150-ton locomotive has "tug-of-war" with Mikado-type steam engine. See also *Ry. Age*, vol. 75, no. 23, Dec. 8, 1923, pp. 1070-1071, 1 fig.

**Twin-Motor Drive.** Individual-Axle Drive by Twin Motors for Electric Locomotives, J. Werz. *Elecn.*, vol. 91, no. 2372, Nov. 2, 1923, p. 488, 2 figs. Advantages of twin motor over single machine are said to be: smaller weight, smaller space occupied, better power factor, smaller inertia in rotating masses, series connection of two armatures (lighter apparatus), and simpler construction; disadvantages: more numerous bearings, limitations in lengths of motor axes, and inaccessibility of commutators. (Abstract.) Translated from *Elektrotechnische Zeit.*

## ELECTRIC RAILWAYS

**London, England.** The Golders Green-Hendon Extension, London Electric Railway. *Ry. Gaz.*, vol. 39, no. 21, Nov. 23, 1923, pp. 645-647, 9 figs. partly on pp. 650-651. Engineering features; notes on stations and signaling, traffic facilities and cost of new works, new rolling stock, train services and fares.

## ELECTRIC WELDING

**Locomotive Repair Shop.** Electric Welding in a German Locomotive Repair Shop (Das elektrische Schweissen bei der Werkstätteninspektion Ingolstadt), H. Vollmayr. *Organ für die Fortschritte des Eisenbahnwesens*, vol. 78, no. 5, May 15, 1923, pp. 85-91,

10 figs. Describes methods employed; points out advantages of cold over hot welding.

## ELECTRIC WELDING, ARC

**Rail Bonds, Copper.** Use of Mold Successful in Arc Welding Copper Rail Bonds, Chester F. Gailor. *Elec. Ry. J.*, vol. 62, no. 24, Dec. 15, 1923, pp. 1001-1003, 4 figs. Describes two methods of arc welding, first employing a carbon electrode and second a copper alloy rod; figures of numerous bond tests.

**Ships.** Applications of Arc Welding to Ship Construction, E. H. Ewertz. *Mar. Eng. & Ship. Age*, vol. 28, nos. 7, 8, 9, 10 and 12, July, Aug., Sept., Oct. and Dec. 1923, pp. 420-424 and 440, 480-491, 549-556, 625-630 and 774-778, 83 figs., 23 tables. Report prepared by author in cooperation with Elec. Arc Weld. Comm. of Am. Bur. Weld. Includes summary of present applications of welding as compared with riveting, description of arc-welded ships in existence and their performance, review of tests to demonstrate the adequacy of welding in ship construction, etc. (To be continued.)

**Tanks.** Arc Welding of Fuel Oil Tanks, Pliny P. Pipes. *Am. Welding Soc.—J.*, vol. 2, no. 11, Nov. 1923, pp. 29-30. Brief description of construction, entirely by electric arc-welding process, of four large fuel oil tanks in Equitable Building, New York City.

## EMPLOYEES, TRAINING OF

**Delco Instruction Course.** Business Economics Taught to Workers at Delco Plant, Harry Tipper. *Automotive Industries*, vol. 49, no. 24, Dec. 13, 1923, pp. 1194-1195. Purpose of new course is to give employees clear conception of structure of industry and to develop individual thought.

**Disabled.** Training and Employment of Disabled Workmen in the Ford Plant. *Monthly Labor Rev.*, vol. 17, no. 5, Nov. 1923, pp. 173-174. How disabled employees are placed so that their maximum ability can be realized.

## ENAMELS

**Red.** United States Government Specification for Water-Resisting Red Enamel. U. S. Bur. Standards, Federal Specifications Board, Standard Specification No. 66, Sept. 25, 1923, 6 pp. Specification officially adopted by Federal Specifications Board on Sept. 1, 1923 for use of Departments and Independent Establishments of Government in purchase of this enamel; covers sampling, laboratory examination, and basis of purchase.

## EVAPORATION

**Multiple-Effect.** Fundamental Principles of Multiple Effect Evaporation, Hugh K. Moore. *Chem. & Met. Eng.*, vol. 29, no. 25, Dec. 17, 1923, pp. 1102-1105, 3 figs. Deals with fundamentals of process; evaporator design and operation; problem of evaporating waste sulphate liquor.

**Pulp Industry.** Some Evaporator Problems Met in the Paper Pulp Industry, George K. Spence. *Chem. & Met. Eng.*, vol. 29, no. 22, Nov. 26, 1923, pp. 972-973. Critical review of processes and equipment from operator's viewpoint, both in soda and sulphate pulp mill and in sulphate mill.

The Case for the Multiple Effect Evaporator in the Pulp Mill, H. Austin. *Chem. & Met. Eng.*, vol. 29, no. 22, Nov. 26, 1923, pp. 974-975, 1 fig. Recovery of black liquor has important bearing on problems of evaporator design and operation.

# F

## FERROALLOYS

**Manufacture.** The Manufacture of Ferro-Alloys, J. A. Holden. *Foundry Trade J.*, vol. 28, nos. 375, 378, 380 and 381, Oct. 25, Nov. 15, 29, and Dec. 6, 1923, pp. 359-360, 418, 461-462 and 485. Oct. 25: Ferrochrome. Nov. 15: Ferrosilicon. Nov. 29: Thermit ferrotungsten. Dec. 6: Electric-furnace ferrotungsten.

## FLIGHT

**Ceiling.** Note on the Graphical Resolution of the Equations of Horizontal Flight and the Determination of Ceiling (Note sur la résolution graphique des équations du vol horizontal et la détermination du plafond), M. Alayrac. *Bul. Technique du Bureau Veritas*, vol. 5, no. 9, Sept. 1923, pp. 184-186, 7 figs. Deduces graphical method from general conclusions on influence of various elements in conditions of flight, and indicates new method of determining ceiling which necessitates only construction of two curves.

**Two-Dimensional Motion of Lamina.** The Two-Dimensional Motion of a Lamina in a Resisting Medium under the Action of a Propeller Thrust, S. Lister. *Lond., Edinburgh, & Dublin Philosophical Mag. & J. Sci.*, vol. 46, no. 275, Nov. 1923, pp. 819-827, 3 figs. Refers to investigation by Lanchester and Brodetsky of "phugoids" or "flight curves" of lamina moving in resisting medium under no external forces other than its own weight; present paper extends investigation by introduction of propeller thrust.

## FLOW OF FLUIDS

**Eddies in Air.** On Eddies in Air, Hirata Nisi and A. W. Porter. *Lond., Edinburgh, & Dublin Philosophical Mag. & J. Sci.*, vol. 46, no. 275, Nov. 1923, pp. 754-768, 18 figs. Deals with eddies which form in air which flows past obstacles of various forms.

## FLOW OF WATER

**Resistance of Structures in Rivers.** The Resistance of Structures in Rivers and Other Open Channels against the Flowing Water (Der Widerstand von Einbauten in Flüssen und anderen offenen Gerinnen

auf das strömende Wasser), H. Krey. *Bautechnik*, vol. 1, no. 40-41, Sept. 21, 1923, pp. 415-416, 3 figs. Describes method of calculation.

## FLUE-GAS ANALYSIS

**Duplex-Mono Recorder.** The "Duplex-Mono" Flue Gas Recorder. *Eng. & Boiler House Rev.*, vol. 37, no. 4, Oct.-Nov. 1923, pp. 108-110, 4 figs. Describes practical way of determining critical point in composition of flue gases where a furnace is working at its highest efficiency; describes Duplex-Mono instrument which automatically records both CO<sub>2</sub> and CO content.

**Gas Sampling.** Sampling of Boiler Flue Gases, T. G. Otley. *S. African Instn. Engrs.—J.*, vol. 22, no. 3, Oct. 1923, pp. 37-40 (includes discussion), 1 fig. Note stressing difficulty of obtaining really reliable gas samples, and explaining why such divergent results are sometimes obtained by different observers on same test; gives results of experiments made showing variation of CO<sub>2</sub> percentage in products of combustion at various points across width of boiler uptake before entering economizer and across economizer uptake before entering economizer and chimney.

## FLYING BOATS

**All-Metal.** The Aeromarine All-Metal Hull Flying Boat, P. G. Zimmerman. *Metal Industry* (N. Y.), vol. 21, no. 12, Dec. 1923, pp. 471-473, 3 figs. Describes latest development in aircraft construction; all-metal flying boat made possible by aluminum.

## FOUNDRIES

**Cleaning-Room Practice.** Modern Cleaning Room Practice, Fred B. Jacobs. *Abrasive Industry*, vol. 4, no. 12, Dec. 1923, pp. 343-346, 5 figs. Cleaning room operations followed at plant of Allyne-Ryan Foundry Co., Cleveland, Ohio, where large numbers of automotive casting are produced daily.

**Problems.** The Present Position of Some Debatable Points in Foundry Practice, V. C. Faulkner. *Foundry Trade J.*, vol. 28, no. 377, Nov. 8, 1923, pp. 390-392 and (discussion) 392-395. Discusses technical instruction, semi-steel, pearlitic cast iron and semi-steel, sulphur in cast steel, separating charges in cupola, and long-life molds.

## FREIGHT HANDLING

**Claim Prevention.** Less Damage to Freight by Rough Handling, C. F. Polzin. *Ry. Age*, vol. 75, no. 23, Dec. 8, 1923, pp. 1057-1059, 2 figs. What locomotive engineer can do to help reduce claim and damage cause; timely and proper use of brake valves can help. Abstract of article which won prize offered by C. & N. W. Ry. for best paper on prevention of freight damage caused by rough handling.

**Terminal Service.** A Study in L. C. L. Freight Terminal Service. *Ry. Rev.*, vol. 73, no. 21, Nov. 24, 1923, pp. 747-750, 6 figs. Chicago junction railway files new inbound less-than-carload freight service, supplementing previous similar arrangement for outbound less-than-carload freight which has been operating successfully; describes complete freight service, particularly in its aspect of affording terminal service in its combination with warehousing.

## FUEL ECONOMY

**Railways.** The Fundamentals of Fuel Economy, W. L. Richards. *Ry. Mech. Engr.*, vol. 97, no. 12, Dec. 1923, pp. 809-813. Points out evils of paper showings; mechanical factors; education and selection of employees. (Abstract.) Paper before Int. Ry. Fuel Assn.

## FUELS

**Coal-Slime Utilization.** Utilization of Coal Slimes of High Ash and Low Volatile Content (Utilisation des schlammes cendreuse et pauvres en matières volatiles), Ch. Hanot. *Revue Universelle des Mines*, vol. 19, no. 2, Oct. 15, 1923, pp. 79-114, 15 figs. Recovery and washing of slimes; combustion in hand- and stoker-fired furnaces; possible efficiencies and costs; consumption in gas producers or in pulverized form.

**Low-Grade.** Utilization of Low-Grade Fuels (Utilisation des combustibles inférieurs), A. Verbruggen. *Association des Ingénieurs Sortis des Ecoles Spéciales de Gand—Annales*, vol. 13, no. 3, 1923, pp. 183-196. Discusses their utilization in pulverized form and without grinding in special furnaces.

**Research.** Some Aspects of the Fuel Problem, C. H. Lander. *Chem. & Industry*, vol. 42, no. 44, Nov. 2, 1923, pp. 1052-1056. Results of recent work carried out by Fuel Research Board, dealing with coal survey, methods of sampling and analysis, gas standards, steaming in vertical retorts, low-temperature carbonization, and power alcohol.

**Sawdust.** Wood-Shop Power Costs Reduced One-Fifth, M. G. Farrell. *Foundry*, vol. 27, no. 23, Dec. 1, 1923, pp. 1174-1177, 2 figs. Proper collection and use of mill refuse as fuel, and rearrangement and selection of motors principal factors in lowered cost in large plant for manufacture of agricultural implements. [See also COAL; OIL FUEL; PULVERIZED COAL.]

## FURNACES, ANNEALING

**Testing.** Practical Points on Testing Annealing Stoves. *Foundry Trade J.*, vol. 28, no. 381, Dec. 6, 1923, p. 474. Points out advantages gained by employing draft gages.

## FURNACES, HEAT-TREATING

**Selection.** Some Observations on Furnaces and Fuels Including the Electric Furnace for Heat Treating, E. F. Collins. *Am. Soc. Steel Treating—Trans.*, vol. 4, no. 6, Dec. 1923, pp. 709-724 and (discussion) 724-726. Points out that furnaces should be fitted to processes rather than attempting to fit special processes to standard furnaces; adaptability of electric heat-treating furnace of metallic resistor type for carbon-steel heat treatment.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**Temperature Regulation.** "Heat Ports" Regulate Temperature Distribution. Fuels & Furnaces, vol. 1, no. 7, Nov. 1923, pp. 555-556, 2 figs. Describes furnace for heat treating various automobile parts, special features of which are heat ports for regulating distribution of temperature in various parts of heating chamber, and removable roof.

#### FURNACES, INDUSTRIAL

**Hydraulic Theory of.** Critical Study of Industrial Furnaces from the Standpoint of the Author's Theory Based on the Laws of Hydraulics (Étude critique des foyers industriels d'après la théorie de l'auteur basée sur les lois de l'hydraulique), W.-E. Groume-Grimaldo. Revue de Métallurgie, vol. 20, no. 10, Oct. 1923, pp. 687-693, 7 figs. Examination of Schurmann cupola, a steam boiler with preheated-air supply, and an open-hearth furnace with divided flame.

## G

#### GAGES

**Pitch Measurement.** The Mechanical Measurement of Pitch, H. T. Wright. Machy. (Lond.), vol. 23, no. 582, Nov. 22, 1923, pp. 236-239, 8 figs. Method of recording and analysis of test results; describes pitch-measuring machines.

#### GALVANIZING

**Crystallization Effects on Galvanized Iron.** Crystallization Effects on Galvanized Iron, J. W. Hannah and E. L. Rhead. Inst. Metals—advance paper, no. 14, for meeting Sept. 10-13, 1923, 15 pp., 6 figs. Results of investigations show that spangle is independent of nature of steel sheet; pure zinc alone is incapable of producing spangle.

**Hot Process.** Developments in the Hot Galvanizing Process. Metal Industry (Lond.), vol. 23, no. 18, Nov. 2, 1923, pp. 386-387, 5 figs. Describes Austrian process and galvannealing process.

**Welding Galvanized Vessels.** How to Prevent Melting Off and Evaporation of the Galvanized Deposit in Welding Galvanized Iron Vessels (Wie ist das beim Schweißen verzinkter Eisenerfasser auftretende Abschmelzen und Verdampfen der Verzinkung zu Behindern?). B. Haas. Zeit. für die gesamte Eisenindustrie, vol. 44, no. 37-38, Sept. 22, 1923, pp. 77-78. Points out that only means of combating effect of high welding heat is to cover welding surfaces and surrounding highly heated metal surfaces with such metal coatings as will at least retard development of vaporizing zinc oxide and melting of galvanized deposit.

#### GAS ENGINES

**Large.** Large Gas Engines. Practical Engr., vol. 68, nos. 1913 and 1914, Oct. 25 and Nov. 1, 1923, pp. 235-236 and 248-249, 10 figs. Describes National engine, which is of vertical tandem high-speed type.

#### GAS PRODUCERS

**Ash-Fusion.** Investigations on the Operation of Ash-Fusion Gas Producers (Untersuchungen über den Betrieb des Abstichgaserzeugers), A. Wilhelmi. Stahl u. Eisen, vol. 43, no. 46, Nov. 15, 1923, pp. 1419-1427, 3 figs. Notes on design and operation; metallurgical phenomena; ash-fusion producer as blast furnace; maximum permissible ash content of fuel; economical features.

#### GASES

**Air Entrainment by Jet of.** The Entrainment of Air by a Jet of Gas issuing from a Small Orifice in a Thin Plate, J. S. G. Thomas and E. V. Evans. Lond., Edinburgh, & Dublin Philosophical Mag. & J. Sci., vol. 46, no. 275, Nov. 1923, pp. 785-801, 5 figs. Consideration of dependence of air entrainment by jet of gas upon density of gas in jet and upon density of air into which jet issues; experiments were confined to hydrogen, coal gas, air, and carbon dioxide.

**Compressibility.** On the Compressibility at 0 Deg. Cent. and Below 1 Atmos. and the Deviation from the Avogadro Law of Oxygen, Hydrogen and CO<sub>2</sub> (Sur la compressibilité à 0° et au-dessous de 1 atmosphère et l'écart à la loi d'Avogadro de plusieurs gaz. I.—Oxygène, hydrogène et anhydride carbonique), P. A. Guye and T. Batuecas. Journal de Chimie Physique, vol. 20, no. 3, Oct. 1, 1923, pp. 308-336, 4 figs. Results of extended experiments at laboratory of physical chemistry, Univ. of Geneva.

**Volume Changes Under High Pressures.** The Volume Changes of Five Gases Under High Pressures, P. W. Bridgman. Nat. Acad. Sciences—Proc., vol. 9, no. 11, Nov. 1923, pp. 370-372. Summarizes most important numerical results of a recent investigation on effect of pressure on volume of hydrogen, helium, ammonia, nitrogen, and argon.

#### GASOLINE

**Vapor Pressure of.** The Vapor Pressures of Gasolines and Light Petroleum Naphthas, F. H. Rhodes and E. B. McConnell. Indus. & Eng. Chem., vol. 15, no. 12, Dec. 1923, pp. 1273-1275, 5 figs. Method for exact determination of vapor pressures of gasoline; measurement of vapor pressures of several different types of gasolines and naphthas; it is shown that no general relation exists between vapor pressure of gasoline and its average distillation temperature or its density.

#### GEARS

**Chucking for Grinding.** Chucking Gears for Grinding. Eng. Production, vol. 6, no. 135, Dec. 1923, pp. 487-489, 14 figs. Details of number of efficient methods.

**Design.** New Applications of Involute Forms Developed in Recent Years, E. W. Miller. Automot-

ive Industries, vol. 49, no. 22, Nov. 29, 1923, pp. 1108-1110, 7 figs. It is claimed that many toothed wheels are being made which cannot receive approval of engineers; close study of minute errors. (Abstract.) Paper read before Am. Gear Mfrs.' Assn.

**Development of Industry.** Development of the Gear Industry. E. W. Miller. Machy. (N. Y.), vol. 30, no. 4, Dec. 1923, pp. 265-269, 13 figs. Importance of finding new uses for gearing, and examples illustrating possibilities. (Abstract.) Paper read before Am. Mfrs.' Assn.

**Manufacture.** Attains Success Specializing in Gear Service, G. L. Ord. Can. Machy., vol. 30, no. 22, Nov. 29, 1923, pp. 13-17, 12 figs. Design and manufacture of gears at plant of Hamilton Gear and Machine Co., Toronto.

**Milled, Analysis of.** Analysis of Milled Gears, E. Wildhaber and E. Buckingham. Am. Mach., vol. 59, no. 21, Nov. 22, 1923, pp. 757-759. Determination of error in using cutter of wrong number; modification of cutting depth; excess depth of cut for backlash.

**Testing.** Modern Problems in Gear Testing and a Proposed Testing Machine, Wilfred Lewis. Am. Mach., vol. 59, no. 24, Dec. 13, 1923, pp. 876-881, 8 figs. Purpose of proposed tests will be determination of effect of varying degrees of tooth accuracy and varying velocities on strength of gear teeth. Paper read before Am. Gear Mfrs.' Assn.

#### GRINDING

**Railway Shops.** Grinding in the Railroad Shops, H. Campbell. Am. Mach., vol. 73, no. 24, Dec. 13, 1923, pp. 861-864, 14 figs. Illustrations and data collected from various shops where grinding machines are used on variety of work.

#### GRINDING MACHINES

**Central-European Types.** European Abrasive Equipment, B. Scapira. Abrasive Industry, vol. 4, nos. 10, 11 and 12, Oct., Nov. and Dec. 1923, pp. 283-285, 321-322 and 356-357, 9 figs. Describes precision grinding machines of various types made by prominent Central-European machine-tool builders; three types of German grinding machines, vertical-spindle and disk-wheel-type surface grinders are in common use.

**Gear.** Automatic Gear Grinder. Iron Age, vol. 112, no. 25, Dec. 20, 1923, pp. 1649-1650, 3 figs. New unit, marketed by Fellows Gear Shaper Co., with adjustable involute control; separate instrument for detecting errors.

## H

#### HACK-SAWING MACHINES

**Blades.** New Metal Sawing Blade Indicates Decided Improvement. Automotive Manufacturer, vol. 65, no. 8, Nov. 1923, pp. 7-9, 4 figs. Describes a hacksaw blade having a special patented set and an unusual shape of cutting edge, and the grinding and sawing machines developed for use with it; the three have been named Rapidor.

#### HANDLING MATERIALS

**Barrel-Stacking Machine.** A New Barrel-Stacking Machine. Indus. Management (Lond.), vol. 10, no. 10, Nov. 15, 1923, pp. 280-281, 1 fig. Device for handling barrels and objects of similar form, such as newsprint reels, drums, hogsheds of tobacco, etc.

**Cost Accounting.** Profit or Loss in Material Handling, Jas. A. Shepard. Management & Administration, vol. 6, no. 6, Dec. 1923, pp. 739-742. False burden figures are said to hide truth in most plants; economy of efficient handling methods.

**Forge Shop.** Well Planned Shop for Handling Material, D. L. Mathias. Forging—Stamping—Heat Treating, vol. 9, no. 11, Nov. 1923, pp. 464-466, 5 figs. Arrangement of Kropp Forge Co.'s plant reduces handling of fuel, raw steel and finished forgings to minimum; waste heat from furnaces used under boilers.

**Open-Ground-Stored Materials.** Storage of Minerals on Open Ground: Considered in Relation to Reclaiming Requirements, Herbert Blyth. Chem. Age (Lond.), vol. 9, no. 232, Nov. 24, 1923, pp. 562-564, 7 figs. Problem of storing minerals on large open spaces considered in relation to necessity for frequent and complete recovery of material from stock heap without hand labor. Describes four systems which provide for double duty of dumping and reclaiming, viz., conveyor method, simple transporter system with fixed track, transporter operating on rotating gantry, and traveling trolley bridge switched to trolley track.

**Warehouses.** Materials Handling in the Warehouse, M. W. Potts. Indus. Management (N. Y.), vol. 66, no. 6, Dec. 1923, pp. 337-343, 12 figs. How mechanical equipment increases capacity.

#### HANGARS

**Dirigible.** Reinforced-Concrete Airship Hangars Under Construction at the Villeneuve-Orly Airport (Hangars à dirigeables en ciment armé en construction à l'aéroport de Villeneuve-Orly), M. Freyssinet. Génie Civil, vol. 83, nos. 12, 13 and 14, Sept. 22, 29 and Oct. 6, 1923, pp. 265-273, 281-297 and 314-319, 48 figs. Details of design and construction of two hangars being constructed for dirigibles of very great dimensions; monolithic construction system used, replacing system based on use of precast elements.

#### HARDNESS

**Brinell Numbers.** Brinell Hardness Numbers, H. W. Brownson. Inst. Metals—advance paper, no. 2, for meeting Sept. 10-13, 1923, 2 pp. Points out desirability of expressing Brinell hardness numbers for

non-ferrous metals on some rational basis, so that figures quoted by different authors may be comparable.

#### HEAT

**Conservation of.** Progress in the Development of Heat Conservation (Fortschritte in der Entwicklung der Wärmewirtschaft), H. Hilliger. Zeit. des Vereines deutscher Ingenieure, vol. 67, nos. 42 and 45, Oct. 20 and Nov. 10, 1923, pp. 981-984 and 1045-1048, 12 figs. Deals with recent tendencies in construction of grates in their relation to design of furnace; importance of pulverized-coal firing in fuel economy; discusses problems of boiler technique, with special reference to heat storage.

#### HEAT STORAGE

**Methods.** Thermal Storage, C. E. Stromeyer. Engineer, vol. 136, no. 3544, Nov. 30, 1923, pp. 582-583. Notes on how to supply hot water required in bleaching and similar works and how to supply steam for peak loads in power stations.

#### HEAT TRANSMISSION

**Box Testing Method.** Box Method for Determining Heat Transmission, Arthur J. Wood. Refrig. Eng., vol. 10, no. 5, Nov. 1923, pp. 172-179, 12 figs. Term "box method" applies to various types of calorimeters for determining constants of heat transmission; types of test boxes; advantages and disadvantages; apparatus and method of testing. Report of Insulation Committee.

**Convection.** Free and Forced Convection of Heat in Gases and Liquids, Chester W. Rice. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 12, Dec. 1923, pp. 1288-1289 and (discussion) 1289-1293, 4 figs. Discusses methods of attacking problem. (Abridged.)

**Nusselt's Investigations.** The Most Important Researches of W. Nusselt for the Determination of Heat Transmission (Die wichtigsten Forschungsarbeiten von W. Nusselt zur Bestimmung des Wärmeüberganges), H. Schmolke. Dinglers polytechnisches J., vol. 338, no. 17-18, Sept. 15, 1923, pp. 173-176. Review of works based on Nusselt's investigations.

**Surface Transfer.** Surface Transfer of Heat, T. S. Taylor. Refrig. Eng., vol. 10, no. 5, Nov. 1923, pp. 179-193, 9 figs. Discusses all factors involved in connection with transfer of heat from surface by all methods of heat flow. Report of Insulation Committee.

#### HEATING

**Factories.** Heating of Factories (Chauffage d'ateliers), H. Jenny. Bul. Technique de la Suisse Romande, vol. 49, nos. 17 and 18, Aug. 18 and Sept. 1, 1923, pp. 197-200 and 216-218, 18 figs. partly on pp. 215-218 and 219. Connection between lighting, heating and ventilating; separate heating and ventilating and combined heating and ventilating; hot-water and hot-air heating; waste-steam utilization.

**Tubular System.** A Tubular Electric Heating System. Engineer, vol. 136, no. 3545, Dec. 7, 1923, p. 614, 2 figs. Lightfoot tubular electric heating system originally devised for heating of explosives factories, where low-temperature heat, widely distributed, is required; now being further developed for industrial, commercial and domestic uses.

#### HEATING, HOUSE

**Oil Burner for.** The Heating of Houses with Oil, C. H. Chalmers. Am. Petroleum Inst.—advance paper, for meeting, Dec. 11-13, 1923, 8 pp. Notes on domestic oil burner and how it operates.

#### HOUSING

**Garden-City Scheme, London.** The Garden Cities of Letchworth and Welwyn Near London (Les cités-jardins de Letchworth et de Welwyn, près de Londres), C. B. Lévy. Génie Civil, vol. 83, no. 19, Nov. 10, 1923, pp. 449-453, 6 figs. Details regarding two English model villages, their organization and financing, and advantages they offer to manufacturers.

**Problems.** Housing Problems in Relation to Industry, Bernard J. Newman. Engrs. & Eng., vol. 40, no. 11, Nov. 1923, pp. 294-298, 4 figs. Unsanitary housing, insofar as industrial workers are concerned. Results in drain upon physical stamina which is conducive to industrial overfatigue.

#### HYDRAULIC TURBINES

**Characteristic Curves.** The Characteristic Curves of Reaction and Impulse Turbines and of Centrifugal Pumps, H. W. Coultas. Beama, vol. 13, nos. 67 and 68, Nov. and Dec. 1923, pp. 304-312 and 379-374, 8 figs. Construction and application. Curves for a centrifugal pump.

**Chemical Measurements.** Recent Applications of Chemical Measuring Methods in Hydroelectric Plants in Dutch East Indies (Over eenige recente toepassingen der chemische debietmeetmethode bij den dienst voor waterkracht en electriciteit in Nederlandsch-Indië), C. G. J. Vreedenburgh. Waterstaats Ingenieur, vol. 11, no. 5, May 1923, pp. 135-145, 21 figs. on supp. plates. Chemical measurement on one of the newly erected turbine sets in hydroelectric station at Bangkok for control of useful effect guaranteed by makers.

**Design and Development.** Waterwheel Construction and Governing, E. M. Breed. Am. Inst. Elec. Engrs.—Jl., vol. 42, no. 12, Dec. 1923, pp. 1261-1263. Review of developments; problems of design; advantages gained by use of propeller-type runner.

**Draft Tubes.** On the Dynamic Similarity of a Draft Tube and Its Model (Sur la similitude dynamique d'un tube d'aspiration et de son modèle), A. Foch. Académie des Sciences—Comptes Rendus, vol. 177, no. 19, Nov. 5, 1923, pp. 868-869. Shows how efficiency of a draft tube can be determined from tests of a small model.

**Governors.** Governors for Hydraulic Turbines,

R. M. White. *Power Plant Eng.*, vol. 27, no. 23, Dec. 1, 1923, pp. 1178-1182, 11 figs. Recent improvements in design have consisted in simplification of details.

Kaplan. The Kaplan Turbine. F. Johnstone Taylor. *Elec. Times*, vol. 64, no. 1673, Nov. 8, 1923, pp. 471-472, 3 figs. Present-day development.

Selection. Choice of Turbines for Hydroelectric Stations (Criteri per l'impiego delle turbine nelle centrali idroelettriche). G. Gambardella. *Elettrotecnica*, vol. 10, no. 28, Oct. 5, 1923, pp. 669-672, 2 figs. Determination of type and fundamental characteristics of turbines to be installed, according to height of fall, quantity of available water and most convenient r.p.m. at which machines will run, necessary to get best efficiency; considers different types of turbines.

#### HYDROELECTRIC DEVELOPMENTS

Bavaria. Water Power in Bavaria. *Times Trade & Eng. Supp.*, vol. 13, no. 279, Nov. 10, 1923, p. 217. Account of big development scheme begun in 1919, including laying of 1154 mi. of 110,000-volt transmission lines and building of 43 power stations and 11 large transformer stations; program of construction.

Switzerland. Construction Work in Connection With Conducting of Water of Lake Arnon to the Grande Eau (Les travaux d'aménage dans la Grande Eau des eaux de lac d'Arnon). P. Schmidhauser. *Bul. Technique de la Suisse Romande*, vol. 49, nos. 9, 11, 12, 13, 14, 15, 16, 18 and 19, Apr. 28, May 26, June 9, 23, July 7, 21, Aug. 4, Sept. 1 and 15, 1923, pp. 102-106, 125-129, 142-146, 154-157, 161-163, 173-178, 185-188, 213-216 and 225-228, 59 figs. Utilization of waters of Lake Arnon; describes hydroelectric system of Société Romande d'Electricité, et la Grande Eau concession; hydrographic data of Lake Arnon; details of construction and tunneling work; equipment; etc.

#### HYDROELECTRIC PLANTS

Glen Falls, N. Y. The Sherman Island Hydroelectric Development of the International Paper Company. B. R. Connell and W. T. O'Connell. *Gen. Elec. Rev.*, vol. 26, no. 12, Dec. 1923, pp. 804-817, 14 figs. Describes problem of design and details of construction.

Niagara. Recent Hydroelectric Installations at Niagara (Les récentes installations hydroélectriques du Niagara). Firkeet. Association des Ingenieurs Electriques Sortis de l'Institut Electrotechnique Montefiore, no. 6, Nov.-Dec. 1922 and no. 1, Jan. 1923, pp. 267-320 and 3-28, 21 figs. Describes works of Niagara Falls Power Co., Toronto Power Co., and Hydroelectric Power Commission of Ontario; new 100,000-hp. plant of Niagara Falls Power Co.; Queens-ton-Chippawa Development.

Off-Peak Load Utilization. Electrochemistry and Electrometallurgy of Surplus Electric Energy (L'Electro-chimie et l'electrometallurgie de l'energie électrique disponible). Curtel-Hulin. *Revue d'Electrochimie et d'Electrometallurgie*, vol. 17, nos. 2 and 3, Feb. and Mar. 1923, pp. 25-27 and 45-48. Discusses use of surplus hydroelectric energy in generating stations, and proposes electrochemical utilization, i.e., electrothermic by heating effect of current and electrolytic by transformation of electric energy into chemical energy; application to electric furnaces.

Spain. Electric Irrigation Plant at Los Almadenes, Spain (Las instalaciones de la Sociedad electrica de Los Almadenes et de la Real Compania de Riegos de Levante). H. Desbarres. *Revue Générale de l'Electricité*, vol. 14, no. 13, Sept. 29, 1923, pp. 444-455, 14 figs. Describes pumping stations of Compania de Riegos de Levante for supplying water for irrigation of Alicante and Murcia regions, and the hydroelectric generating station at Los Almadenes, of 12,600 hp., 6000 hp. of which is supplied to Compania de Riegos de Levante for its pumping stations, and rest distributed in Murcia and Alicante region.

Wales. The Cynwyd, North Wales, Hydro-Electric Station. *Elec. Rev.*, vol. 93, no. 2398, Nov. 9, 1923, pp. 685-686, 2 figs. A 106-kw. installation designed and carried out by Gilbert Gilkes & Co., Kendal.

## I

#### ICE MANUFACTURE

Electric Power In. Ice Making with Electric Power. *Elec. World*, vol. 82, no. 24, Dec. 15, 1923, pp. 1215-1218, 8 figs. Use of different types of motors; controls and switchboard layouts; typical high-speed and low-speed plants.

#### ICE PLANTS

Oil-Engine-Driven. Oil-Engine Drive Promotes Ice-Plant Efficiency. Robert G. Skerrett. *Compressed Air Mag.*, vol. 28, no. 11, Nov. 1923, pp. 693-697, 14 figs. Description of equipment of Central Ice & Cold Storage Corp., at Vineland, N. J.; electric current for illuminating, handling ice in tank room and on loading platform, driving brine agitators, operating centrifugal pumps, etc., generated by 65-kw. dynamo directly connected to a 100-hp. Ingersoll-Rand oil engine running at 257 r.p.m.

Raw-Water. New Raw Water Ice Plant of Pittmans & Dean Co., Detroit. Ice & Refrigeration, vol. 65, no. 5, Nov. 1923, pp. 245-250, 10 figs. Description of a modern electrically driven plant, including general arrangement, machine room, refrigeration and mechanical equipment, ice-making system, ice-storage room, and electrical equipment; power consumption.

#### IMPACT TESTING

Notched-Bar Tests. The Significance of the Notched-Bar Test (Was haben wir an der Kerbschlagprobe?). P. Ludwik. *Stahl u. Eisen*, vol. 43, no. 46, Nov. 15, 1923, pp. 1427-1428. Author seeks to show

that decrease in notched-bar toughness occurring when limit impact velocity is exceeded is attributable to too little cohesion in relation to internal friction.

#### INDUSTRIAL MANAGEMENT

Stores Management. Modern Practice in Stores Management. William D. Gordon. *Indus. Management* (N. Y.), vol. 65, nos. 5, 6 and vol. 66, nos. 3 and 6, May, June, Sept. and Dec. 1923, pp. 274-278, 375-378, 1 fig., 163-169, 7 figs. and 320-326, 6 figs. May: Effects of poor stores system; Dewey decimal and mnemonic symbol systems for classification. June: Location and physical arrangement. Sept.: Planned production and storeroom operation. Dec.: Stores accounting.

#### INDUSTRIAL RELATIONS

Employee's Magazine. Making the Employee Publication Really Pay. D. C. Vandercook. *Factory*, vol. 31, nos. 5 and 6, Nov. and Dec. 1923, pp. 613-615 and 644 and 646; and 755-756, 778, 780, 782, 784, 786 and 788. Nov.: Management's share in helping its personnel magazine to succeed. Dec.: Personnel director and editor—their jobs.

#### INSTRUMENTS

Mechanical, Life Testing of. Life Testing of Mechanical Instruments. Frederick J. Schlink. *Optical Soc. Am.—Jl.*, vol. 7, no. 11, Nov. 1923, pp. 1031-1042. Selection of specimens for test; preparation for test; maintenance during test; nature of mechanical wear; limitations and special features of forced test. Part of report of Am. Soc. Mech. Engrs.' special research committee on permanency and accuracy of engineering instruments.

#### INTERNAL-COMBUSTION ENGINES

Admission and Exhaust Elements. Study of Admission and Exhaust Elements of Internal-Combustion Engines (Etude des Organes d'alimentation des moteurs à combustion interne). O. Leperonnet. *Technique Automobile et Aérienne*, vol. 14, no. 122, 1923, pp. 83-93, 13 figs. Calculation of dimensions of admission and exhaust pipes, of angles of opening and closing of admission and exhaust valves, and of pressure in cylinder at end of suction stroke.

Development. History and Development of the Internal-Combustion Engine and the Motor Ship. John H. Narbeth. *Steamship*, vol. 34, nos. 403, 404, 405, 406, 408, 409, 410, 411, 412, 413 and 414, Jan., Feb., Mar., Apr., June, July, Aug., Sept., Oct., Nov. and Dec. 1923, pp. 208-214, 251-258, 279-286, 311-318, and 374-380, 9-15, 44-53, 80-83, 108-114, 140-142 and 172-174, 61 figs. Jan.: Diesel's position, work and early engines; first British-built Diesel engine; solid-injection engines. Feb.: Russia's start in 1902; Noble 2- and 4-stroke engines. Mar.: Early discussions in United Kingdom. Apr.: Sulzer Bros.; Atlas Diesel Co.—polar engines; early M. A. N., Carls Diesel, Krupp, Junkers and Burmeister & Wain engines. June: Gasoline and Diesel-driven submarines; Vickers' engines, works and improvements; Fullagar engines. July: Doxford and North British Diesel engines. Aug.: Still engine. Sept. and Oct.: General European progress, 1912-20. Nov. and Dec.: United States progress—noteable ships.

Exhaust and Scavenging Process. The Exhaust and Scavenging Process in Two-Stroke Engines (Der Aussenpuff und Spülvorgang bei Zweitaktmaschinen). M. Ringwald. *Zeit. des Vereines deutscher Ingenieure*, vol. 67, nos. 46 and 47-48, Nov. 17 and 24, 1923, pp. 1057-1061 and 1079-1082, 15 figs. Laws are derived, and it is shown how conclusions can be drawn from experimental results on engines of other size and speed.

Manifolds, Hot-Spot. Temperature Requirements of Hot Spot Manifolds. C. S. Kegerreis and O. C. Berry. *Purdue Univ.—Bul.*, vol. 7, no. 10, Sept. 1923, 42 pp., 29 figs. Details of investigations to determine temperatures required for vaporization of different fuels at high rates, and temperatures available in exhaust under different running conditions, and results obtained.

Shock Reduction. Shocks in Piston Engines (Einiges über die Stöße bei Kolbenmaschinen). Arthur Balogh. *Wirtschaftsmotor*, vol. 5, no. 8-9, Sept. 25, 1923, pp. 12-13. In order to reduce shocks in piston engines during working period, a critical number of revolutions is determined based on condition that no change in direction of forces takes place.

Vibrations. Effects Produced by Vibrations in Internal-Combustion Engines. J. Geiger. *Power*, vol. 58, no. 24, Dec. 11, 1923, pp. 964-965. Vibrations felt a mile away; preventive measures that have proved successful. Translated from paper read before Assn. German Engineers (V. d. I.).

[See also AUTOMOBILE ENGINES; DIESEL ENGINES; GAS ENGINES; OIL ENGINES; SEMI-DIESEL ENGINES.]

#### IRON CASTING

Channel Beams. Making Iron Channel Frames. H. R. Simonds. *Foundry*, vol. 51, no. 23, Dec. 1, 1923, pp. 933-937, 9 figs. Describes practice at Saco-Lowell foundry in Lowell, Mass., and successive steps in production of long channel beam castings for textile machinery.

Core Removal with Vibrator. Remove Cores with Vibrator. *Foundry*, vol. 51, no. 24, Dec. 15, 1923, pp. 984-985, 2 figs. Four special machines equipped with powerful vibrators at plant of Ferro Machine & Foundry Co., Cleveland, O., serve to remove cores and adhering sand from automobile cylinder castings at rate of 200 per hr.

Fine-Limit. Fine Limits in Foundry Practice. C. Dicken. *Foundry Trade Jl.*, vol. 28, no. 377, Nov. 8, 1923, pp. 396-399, 11 figs. Timing-case cover; motor crankcase troubles; a striking fork difficulty; water-cooled cylinder; cupola practice.

Test Bars. Making and Testing Test Bars. J. S. Glen Primrose. *Foundry Trade Jl.*, vol. 28, no. 380,

Nov. 29, 1923, pp. 463-465 and (discussion) 465-466. Test bars for steel; testing wire and cast iron; position of cast-on bar; non-ferrous test bars; runners as test bars; tensile, transverse, compression, hardness, impact and torsion testing.

Test Bars. Rob. Buchanan. *Foundry Trade Jl.*, vol. 28, no. 379, Nov. 22, 1923, pp. 440-442. Importance of grain size in test bar and castings; tensile test bars; tentative specifications for gray-iron castings; proposed specifications. Discussion.

## L

#### LATHES

Bench. Recent Developments in Precision Bench Tools. B. A. Behrend. *Am. Mach.*, vol. 59, nos. 17, 20 and 23, Oct. 25, Nov. 15 and Dec. 6, 1923, pp. 607-611, 719-722 and 829-831, 46 figs. Describes tools in use in author's mechanical laboratory.

Center. 32-Inch Centre Break Lathe. Machy. (Lond.), vol. 23, no. 583, Nov. 29, 1923, pp. 257-262, 9 figs. For turning, facing, boring, and screw-cutting operations on heavy hydraulic work.

Collets for Machining. How Rivett Makes Spring Collets. *Am. Mach.*, vol. 73, no. 24, Dec. 13, 1923, pp. 865-867, 7 figs. Formed upon Gridley automatics; held upon centers in succeeding operations; final grinding.

Maudslay. A Maudslay Lathe. *Practical Engr.*, vol. 68, no. 1917, Nov. 22, 1923, pp. 283-284, 1 fig. Describes foot lathe probably made about year 1800.

30-Ft. A 30-Ft. Lathe Built in San Francisco in 1865. Fred H. Colvin. *Am. Mach.*, vol. 59, no. 23, Dec. 6, 1923, pp. 847-848, 4 figs. Built in shop of Miners Iron Works in 1865 and still in same shop where it is used for very large work from entire section.

Wheel. Construction and Individual Parts of a New Type Wheel Lathe. O. Krupski. *Eng. Progress*, vol. 4, no. 10, Oct. 1923, pp. 215-216, 6 figs. Details of lathe built by W. Hegenscheidt Corp., Ratibor, Germany, for machining wheels; profiles may be machined without cutting off piece; possibility of accurately centering piece fixed in; development of measuring equipment.

#### LOCOMOTIVE BOILERS

Crown Sheets. Designing the Crown Sheets of Locomotive Boilers. A. Wrench. *Boiler Maker*, vol. 23, no. 11, Nov. 1923, pp. 301-305, 29 figs. Outline of British methods of staying boilers compared with American practice.

Operation Efficiency. An Efficient Heat Interchange Apparatus. L. H. Fry. *Mich. Technic*, vol. 37, no. 1, Nov. 1923, pp. 12-14 and 30, 1 fig. Illustrates efficiency with which a well designed locomotive boiler operates and indicates sources of this efficiency; determination of quantity of heat radiated to firebox; heat transfer in flues.

#### LOCOMOTIVES

Fireboxes. Investigations on Low-Carbon-Steel Firebox Plates (Untersuchungen an flusseisenernen Feuerbuchsblechen). R. Kühnel and M. Mohrmann. *Glaser Annalen*, vol. 93, nos. 7 and 8, Oct. 1 and 15, 1923, pp. 83-87 and 91-95, 16 figs. Discusses use of mild-steel in place of copper fireboxes.

Manufacture, England. Short Histories of Famous Firms. *Engineer*, vol. 136, no. 3543, Nov. 23, 1923, pp. 548-550, 11 figs. History of firm of Kitson & Co., Airedale foundry, Leeds, and locomotives built by them since 1840.

Mikado. Mikado Locomotives for the Lehigh Valley. *Ry. Age*, vol. 75, no. 21, Nov. 24, 1923, pp. 959-960, 2 figs. Particulars of 2-8-2 freight locomotives recently built for Lehigh Valley Ry., order of 30 having been divided equally between Baldwin Locomotive Works and Am. Locomotive Co.

Mountain Type. Mountain Type Locomotive for Great Northern. *Ry. Age*, vol. 75, no. 23, Dec. 8, 1923, pp. 1065-1066, 2 figs. Particulars of 4-8-2 type locomotives for heavy passenger traffic replacing Pacific type; weight in working order 365,600 lb.; 54,830 lb. tractive force.

Overload Capacity. The Overload Capacity of Steam Locomotives (Ueber die Ueberlastungsfähigkeit der Dampflokomotiven). H. Severin. *Organ für die Fortschritte des Eisenbahnwesens*, vol. 78, no. 5, May 15, 1923, pp. 92-93. It is shown that overload capacity of steam locomotive is at least equal to that of electric locomotive, if it does not exceed it, due to fact that overload capacity of latter is limited by heating of rotor.

Pacific Type. Canadian Pacific Standard 4-6-2 Locomotive. *Ry. Mech. Engr.*, vol. 97, no. 12, Dec. 1923, pp. 803-808, 8 figs. Also *Ry. Age*, vol. 75, no. 24, Dec. 15, 1923, pp. 1107-1108, 1 fig. Heavy Pacific type with well-proportioned boiler; improvements in details.

Regulators. Multiple-Valve Locomotive Regulator. *Engineering*, vol. 116, no. 3021, Nov. 23, 1923, p. 648, 3 figs. Recently placed on market by Société Franco-Belge de Matériel de Chemins de Fer, La Croÿère, Belgium, and known as Lejeune regulator; it is of multiple-valve type and it is claimed that valve remains completely steam-tight for long periods in service; advantages.

Repairing. Repairing Locomotives in Contract Shops. Fred H. Colvin. *Am. Mach.*, vol. 59, no. 23, Dec. 6, 1923, pp. 833-834. Problems of shops repairing locomotives in place of their regular product; diversity in railway practice; Ford eliminated spring breakages; oil economy vs. repair costs.

Small Heavy. Small Heavy Locomotives. Blast Furnace & Steel Plant, vol. 11, no. 12, Dec. 1923, pp.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

633-634, 1 fig. Steel-mill limitations overcome by various departures from design principles; uniqueness lies principally in great weight carried on short wheel-base and narrow-gage track.

**Standardization of Repair Parts.** Standardization of Locomotive Repair Parts. M. H. Williams. Ry. Mech. Engr., vol. 97, nos. 8 and 9, Aug. and Sept. 1923, pp. 581-583 and 645-647, 6 figs. Aug.: Manufacturing and fitting standard knuckle, crank and crosshead pins requiring frequent renewal. Sept.: Methods of manufacturing and fitting standard taper frame bolts; reaming holes to step gages.

**Steam-Turbine.** The Ramsay Condensing Turbine Electric Locomotive. Ry. & Locomotive Eng., vol. 36, no. 12, Dec. 1923, pp. 371-373, 2 figs. New adaptation of turbine to locomotive.

**Three-Cylinder.** Three-Cylinder Freight Locomotive on the New York Central. Ry. & Locomotive Eng., vol. 36, no. 12, Dec. 1923, pp. 373-374, 1 fig. First application of 3-cylinder principle to heavy freight engine.

## LUBRICATING OILS

**Engine.** Engine Lubrication and the Phenomena of Viscosity (Le problème du graissage dans les moteurs et les phénomènes de viscosité). N. Champsaur. Aérophile, vol. 31, nos. 15-16 and 17-18, Aug. 1-15 and Sept. 1-15, 1923, pp. 247-249 and 280-285, 10 figs. Lubricating power of oils; adhesion; viscosity.

**Properties.** Physical and Chemical Properties of Lubricating Oils (Caractères physiques et chimiques des huiles de graissage). J. Levy. Technique Moderne vol. 13, no. 21, Nov. 1, 1923, pp. 695-703, 8 figs. Influence of the various properties, such as density, volatility, viscosity, acidity, evaporation, etc., on lubrication.

Some Physical Properties of Lubricants. E. A. Evans. Instn. Petroleum Technologists—Jl., vol. 9, no. 39, Oct. 1923, pp. 380-384, 6 figs. Relative efficiencies of several oils. See also article by same author, entitled, Asphalt in Lubrication Oils, pp. 384-388.

# M

## MACHINE SHOPS

**Idle Capital in.** Idle Capital in the Machine Shop. A. Easthope. Eng. Production, vol. 6, no. 135, Dec. 1923, pp. 474-479 and (discussion) 479-481. Method of tabulating total weekly loss of capital occurring in non-use of machine tools, and necessary steps toward removing cause; trend of modern organization.

## MACHINE TOOLS

**Development, New England.** Development of Machine Tools in New England. Guy Hubbard. Am. Mach., vol. 59, nos. 1, 4, 7, 9, 11, 14, 15, 16 and 25, July 5, 26, Aug. 16, 30, Sept. 13, 27, Oct. 11, 18 and Dec. 20, 1923, pp. 1-4, 139-142, 241-244, 311-315, 389-392, 463-465, 511-514, 579-581 and 919-922, 57 figs. July 5: Original settlers; difficulty of transportation; famous establishments. July 26: Beginning of iron industry; early high-pressure, double-acting steam engine. Aug. 16: Experiments with steam boats; gun-stock lathe. Aug. 30: Ornamental period in machine design; machine for ruling paper; history of dividing engine for graduating scales and rules. Sept. 13: Invention of bandsaw and rotary pumps. Sept. 27: Special machines for manufacturing rotary pumps; development of interchangeable system; working with convict labor. Oct. 11: Gun-making by interchangeable system; payments made by land. Oct. 18: Kendall underhammer rifles. Dec. 20: Making rifles for Government; plant for building cars; manufacture of Sharps rifle.

**Railway-wheel Production.** Machine Tools for Railway Wheel Production. Machy. (Lond.), vol. 23, nos. 580 and 583, Nov. 8 and 29, 1923, pp. 173-175, 6 figs. and 276-278, 5 figs. Lathes and boring mills made by Niles-Bement-Pond Co.

**Typewriter Manufacture.** Special Machines in a Typewriter Plant. C. Gabrielson. Machy. (Lond.), vol. 23, no. 583, Nov. 29, 1923, pp. 263-267, 9 figs. Unusual mechanisms incorporated in design of special high-production machines, used in plant of L. C. Smith & Bros. Typewriter Co.

## MALLEABLE CASTINGS

**Hardening.** Tool Production from Hardened Malleable Iron. E. K. Smith. Can. Machy., vol. 30, no. 22, Nov. 20, 1923, pp. 21 and 38. Feasibility of hardening parts of malleable castings, nature of hardened product, and processes best adapted to hardening; advantages of malleable castings.

## MANGANESE STEEL

**Casting.** Specializes Manganese Steel. H. E. Diller. Foundry, vol. 51, no. 22, Nov. 15, 1923, pp. 891-897, 14 figs. Methods and equipment of foundry of Taylor-Wharton Iron & Steel Co., High Bridge, N. J., which turned from production of car wheels and axles to casting manganese steel; melts ferromanganese in cupola for converter steel.

**Characteristics.** Characteristics of Some Manganese Steels. Jerome Strauss. Am. Soc. Steel Treating—Trans., vol. 4, no. 6, Dec. 1923, pp. 665-708, 17 figs. Review of previously published data and new metallographic survey, supplemented by mechanical tests, of portion of iron-carbon-manganese system; mechanical, electrical and magnetic properties of commercial manganese steels; constitution and possible improvements; directions in which manganese may prove useful as alloying element.

## MEASURING INSTRUMENTS

**Extensometer Amplifier.** An Extensometer Amplifier. S. R. Williams. Optical Soc. Am.—Jl., vol. 7,

no. 11, Nov. 1923, pp. 1011-1013, 3 figs. Details of device for multiplying effect of any linear displacement; outfit at present in use has multiplication factor of 65,000.

**Generator Comparator.** Measuring in Millionths of an Inch. Practical Engr., vol. 68, no. 1916, Nov. 16, 1923, pp. 273-274, 2 figs. Describes generator comparator used by makers, Pitter Gage & Precision Tool Co., Ltd., Eng., in process of manufacturing end gage bars; readily adapted to do all measurements which can be performed in ordinary anvil type of horizontal measuring machine.

**Precision.** Modern Precision Measuring Appliances for Mechanical Engineering. Eng. Progress, vol. 4, no. 10, Oct. 1923, pp. 201-212, 54 figs. Description is limited chiefly, but not exclusively, to instruments for measuring lengths; deals with fixed, limited, standard, adjustable, inside, depth and thickness gages; minimeters, measuring dials and machines, seating gages, measuring implements for threads, angle meters, etc.

**Torsion Meter.** Torsimeters for Measuring the Power of Steam Turbines (I torsimetri per la misura della potenza delle turbine a vapore). C. Bertella. Ingegneria, vol. 1, no. 6, Dec. 1, 1922 and vol. 2, no. 3, Mar. 1, 1923, pp. 146-151 and 69-75, 34 figs. Construction and operation of acoustic, mechanical, electrical and optical torsimeters.

## METALS

**Conductivity, Effect of Tension on.** The Effect of Tension on the Thermal and Electrical Conductivity of Metals. P. W. Bridgman. Am. Acad. Arts & Sciences—Proc., vol. 59, no. 6, Nov. 1923, pp. 119-137, 2 figs. Develops improved method, and measures thermal conductivity under tension of seven metals and change of electrical conductivity under tension of same metals; theoretical discussion.

**Corrosion Prevention.** The Prevention of Corrosion. Chem. Age (Lond.), vol. 9, no. 232, Nov. 24, 1923, pp. 566-567. Reviews means which are now available for rendering metals non-corroding; attention called in particular to use of stainless steels and quite recent progress which has been made with alloys of high nickel and chromium content.

**Deformation Due to Rolling.** Material Displacement in Connection with Rolling (Ueber die Materialverschiebung beim Walzen). G. Gredt. Stahl u. Eisen, vol. 43, no. 47, Nov. 22, 1923, pp. 1443-1449, 6 figs. Observation of relative change of segregation; confirmation of Rummel theory that deformation is independent of plasticity.

**Deformation Under Compression.** The Behaviour of Metals under Compressive Stresses. H. I. Coe. Inst. Metals—advance paper, no. 3, for meeting Sept. 10-13, 16 pp., 7 figs. Consideration of plastic deformation of tin under compressive stress; it is shown that tin becomes truly plastic at load corresponding to peak, then stiffens slightly, but subsequently becomes perfectly plastic again.

**Failures.** Metals in Engineering Service. Gordon Sproule. Eng. Jl., vol. 6, no. 12, Dec. 1923, pp. 523-530, 27 figs. Notes on design, choice of materials and inspection of failures.

**Fatigue.** "Fatigue" of Metals and the Basic Assumptions of Mechanics of Materials. H. F. Moore. Mich. Technique, vol. 37, no. 1, Nov. 1923, pp. 17-18 and 30, 2 figs. Discusses breakdown of metals under repeated stress.

**Grain Structure.** Structural Changes in Metals through Cold Working (Ueber Strukturänderungen in Metallen durch Kaltbearbeitung). M. Polanyi. Zeit. fur Physik, vol. 17, no. 1, July 30, 1923, pp. 42-53. Refers to previous work in which explanation is given of the origin of grain structure under elongation of wires; certain points in this explanation are reconsidered and enlarged upon.

**Lacquering.** Blushing. Hugo Zeller. Metal Industry (N. Y.), vol. 21, no. 11, Nov. 1923, pp. 444-445. Causes and methods of prevention of conditions variously termed blushing, clouding or white troubles. See also Metal Industry (Lond.), vol. 23, no. 22, Nov. 30, 1923, p. 489.

**Polishing.** Polishing Methods Investigated. E. Farmer and R. S. Brooke. Abrasive Industry, vol. 4, nos. 9, 10, 11 and 12, Sept., Oct., Nov. and Dec. 1923, pp. 259-260, 287-289, 331-334 and 361-365, 4 figs. Description of British polishing practice. Production was expedited by installing seats and eye shields; loose abrasives used extensively; motion studies in buffing operations showed that no two operators followed like methods.

**Rate of Cooling, Effect of.** Effects of Rate of Cooling on the Density and Composition of Metals and Alloys. R. C. Reader. Inst. Metals—advance paper, no. 13, for meeting Sept. 10-13, 1923, 5 pp. Numerical values are recorded showing effect upon density and composition throughout mass of metals and alloys due to different rates of solidification.

**Repeated Stresses, Behavior Under.** The Behavior of Metals Subjected to Repeated Stresses. H. J. Gough. Roy. Soc.—Proc., vol. A-104, no. A-727, Nov. 1, 1923, pp. 538-655, 18 figs. partly on supp. plates. Review of previous work done; details of mechanical tests, and of study of microstructure of material when subjected to static tensile stresses and when subjected to reversed bending stresses.

**Research.** The German Metal-Research Society, Hubert Hermanns. Metal Industry (Lond.), vol. 23, no. 20, Nov. 16, 1923, pp. 439-440. Abstracts of papers read at meeting of Deutsche Gesellschaft für Metallkunde, on solidification of metals, ternary alloys, aluminum alloys, synthesizing pulverized metals, chromium plating and other deposits, single crystals, etc.

**Testing.** Metal Testing (Stato attuale della prova dei metalli). V. Prever. Ingegneria, vol. 2, nos. 5 and

May 6, 1 and June 1, 1923, pp. 114-117 and 146-152, 20 figs. Discusses chemical and physical properties of alloy steels, composition, mechanical properties and their effects, etc., in connection with Fiat metallurgical laboratory at Torino.

**Volume Change During Solidification.** On the Measurement of the Change of Volume in Metals during Solidification. Hikozi Endo. Inst. Metals—advance paper, no. 4, for meeting, Sept. 10-13, 17 pp., 2 figs. Results of measurements of change of volume during solidification or melting for number of metals having low melting points up to 1100 deg. cent.

## MILLING CUTTERS

**Helical Involute Teeth.** Selection of Milling Cutters for Helical Involute Teeth. E. Wildhaber. Am. Mach., vol. 59, no. 25, Dec. 20, 1923, pp. 909-911, 5 figs. New formula for tooth number of formed milling cutter to cut helical involute teeth; based on mathematical principles and easy to use; different results from old formula.

## MILLING MACHINES

**Universal.** Universal Milling Machine. Eng. Progress, vol. 4, no. 10, Oct. 1923, pp. 212-213, 2 figs. Machine constructed by Mammut Werke, Nurnberg, has arrangement providing for two overhanging arms, eliminating shear-type connection between overhanging arm and knee still in vogue with all other types of milling machines.

## MOLDING MACHINES

**European Continental Practice.** Continental Moulding Machine Practice. A. S. Beech. Foundry Trade Jl., vol. 28, no. 380, Nov. 29, 1923, pp. 451-456, 12 figs. Details progress made in Continental foundries in respect of pressure molding machines, and gives conclusions drawn by author from his experience.

## MOLDING METHODS

**Gating.** Proper Gating an Important Factor in Molding. F. W. Best. Can. Foundryman, vol. 14, no. 11, Nov. 1923, pp. 15-16, 9 figs. Good metal poured into otherwise good molds may produce bad castings if mold is improperly gated; examples of gates and their characteristics.

**Tubes, Small-Flanged.** The Molding of Small Flanged Tubes. R. E. Search. Metal Industry (N. Y.), vol. 21, no. 11, Nov. 1923, pp. 435-437, 3 figs. Advantages and disadvantages of molding with flange above or below. Abstracted from Fonderie Moderne, May 1923.

## MOLDS

**Multiple, Made in Loam.** Multiple Molds Made in Loam. J. H. Eastham. Foundry, vol. 51, no. 24, Dec. 15, 1923, pp. 1002-1003, 5 figs. This method, usually confined to production of small castings, may be adapted under certain conditions to large castings at saving in time and material.

## MOTOR TRUCKS

**All-Wheel Braking.** All-Wheel Braking for Business Vehicles. Richard Twelvetees. Motor Transport (Lond.), vol. 37, nos. 975, 976 and 977, Nov. 5, 12 and 19, 1923, pp. 533-554, 589-590 and 644-645, 10 figs. Some considerations affecting use of multi-wheel brakes in commercial service.

**British Show.** A Forecast of Olympia. Motor Transport (Lond.), vol. 37, no. 977, Nov. 19, 1923, pp. 621-639, 37 figs. Complete review of gasoline, gasoline-electric, electric, and steam vehicle, trailer, and bodywork exhibits at commercial motor transport and roads development exhibition at London, England.

**The Commercial Motor Exhibition.** Engineer, vol. 136, nos. 3544 and 3545, Nov. 30 and Dec. 7, 1923, pp. 580-582 and 608-613, 25 figs. Description of exhibits.

**The Olympia Show.** Motor Transport (Lond.), vol. 37, no. 978, Nov. 26, 1923. Gasoline and gasoline-electric vehicles, pp. 676-702, 108 figs.; electric vehicles, pp. 702-704, 9 figs.; steam trucks and tractors, pp. 705-709, 19 figs.; bodywork for passengers and goods, pp. 710-714, 18 figs.; trailer exhibits, pp. 715-716, 6 figs.; accessories, tires and components, pp. 717-724, 24 figs.

**Dennis.** 20-25 Cwt. Dennis Design. Motor Transport (Lond.), vol. 37, no. 978, Nov. 26, 1923, pp. 729-731, 10 figs. Details of new design.

**Electric.** Details of the Laporte 5-Ton Truck (Caractéristiques des camions Laporte de 5 T.). Electricien, vol. 54, no. 1334, Oct. 15, 1923, pp. 459-461, 4 figs. Truck with rear wheels each driven by an independent motor; can climb short grades of 12 to 15 per cent without overheating motors; fed by 80 Tudor cells weighing 4000 lb. in all.

**The Crochat 6-Ton Truck (Le camion Crochat de 6 tonnes type A-5).** Electricien, vol. 54, no. 1334, Oct. 15, 1923, pp. 461-462, 1 fig. Brief particulars of a new battery-drive truck.

**German.** The Motor Trucks at the Berlin Automobile Exhibition 1923 (Die Lastkraftwagen auf der Berliner Automobil-Ausstellung 1923). Motorwagen, vol. 26, no. 28, Oct. 10, 1923, pp. 419-420. Brief description of exhibits.

**Maudslay.** New Maudslay Models. Motor Transport (Lond.), vol. 37, no. 979, Dec. 3, 1923, pp. 741-742, 5 figs. Details of 2-ton and 30-cwt. chassis.

**Parts Interchangeability.** Interchangeability of Parts in 5 Standard Models. Motor Transport (N. Y.), vol. 29, no. 8, Nov. 15, 1923, pp. 266-267, 2 figs. With exception of major units which are determined by speed and load characteristics, all parts for each size of truck (Standard Motor Truck Co.) are, insofar as possible, interchangeable.

**Propeller-Shaft Brake.** Disk Type Propeller Shaft Brake Used on New 2½-Ton Truck. Automotive Industries, vol. 49, no. 24, Dec. 13, 1923, pp. 1198-1199, 3 figs. Novel form adopted on new 2½-ton truck

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

of La France Co.; fitted with double-reduction instead of worm-gear axle, although worm drive can be used without material change.

**Six-Wheeler.** New British Six-Wheeler Has Separate Suspension for Rear End. Automotive Industries, vol. 49, no. 24, Dec. 13, 1923, pp. 1209-1210, 4 figs. Details of new flexible six-wheeler or semi-trailer which has been under test on British roads by its makers, the Asmo. Equipment Co.; brake equipment includes hand, foot and air-actuated shoes; has engine of 65 hp. and is designed to average 12 mi. per hr. with 10-ton load.

**Wheelless.** A Wheelless Motor-Car, Alfred Gradenwitz. Sci. Am., vol. 129, no. 6, Dec. 1923, p. 381, 1 fig. Describes vehicle of wheelless type invented by R. Venzlaff of Berlin, comprising two pairs of runners 3 m. long which, like the four feet of a horse, are alternately raised and lowered, runners of each pair being rigidly connected with one another; vehicle crosses ditches with ease and will readily negotiate considerable gradients; crude-oil engines can largely be used, thus reducing working expenses.

## O

### OIL ENGINES

**Allis-Chalmers.** Operation and Care of the Allis-Chalmers Oil Engine. Southern Engr., vol. 40, nos. 3 and 4, Nov. and Dec. 1923, pp. 35-38 and 45-48, 9 figs. Engine operates on four-stroke-cycle Diesel system. Pointers on starting and shutting down, operation, care of main bearings, shaftings, crank and piston pin adjustment, distribution of load to cylinders, handling air-injection valve, and care of fuel-oil pumps and of main inlet and exhaust valve.

**Cold-Starting Heavy-Oil.** An Innovation in Textile Mill Driving. Power Engr., vol. 18, no. 213, Dec. 1923, pp. 460-463, 6 figs. Describes Imperial-Keighley cold-starting heavy-oil engine and its advantages as prime mover in textile mill.

**High-Compression.** High Compression Oil Engines in Theory and Practice. Power Engr., vol. 18, nos. 212 and 213, Nov. and Dec. 1923, pp. 411-413 and 445-447, 8 figs. Various points of importance in connection with this type of engine. Nov.: Moderate-capacity engines. Dec.: Mechanical parts are discussed severally and together.

**Manufacture.** A Modern Oil Engine Works. Eng. Production, vol. 6, nos. 134 and 135, Nov. and Dec. 1923, pp. 457-463 and 491-494, 26 figs. Describes plant and methods of Petters, Ltd., at Yeovil, Somerset, Eng., manufacturing engines embodying a two-stroke cycle operating on semi-Diesel principle.

**Scott-Still.** The Scott-Still Marine Oil Engine. Engineer, vol. 136, nos. 3543 and 3544, Nov. 23 and 30, 1923, pp. 556-558 and 592-594, 14 figs. Design and performance of first commercial Scott-Still marine engines to be completed and tested; to be installed in motorship Dolius. See also Engineering, vol. 116, no. 3021, Nov. 23, 1923, pp. 639-640, 12 figs.

**Various Oil Engine Trials and Experiments.** A. I. Nicholson. Motorship, vol. 8, no. 12, Dec. 1923, pp. 866-871, 10 figs. Résumé of trials carried out on Scott-Still combination oil and steam engine. (Abstract.) Paper read before Instn. Engrs. & Shipbuilders in Scotland.

### OIL FUEL

**Atomization.** Mechanical Atomization of Fuel Oil, Claude C. Brown. Power Plant Eng., vol. 27, nos. 22, 23 and 24, Nov. 15, Dec. 1 and 15, 1923, pp. 1130-1132, 1192-1194 and 1238-1241, 5 figs. Nov. 15: Methods of atomization; types of atomizers. Dec. 1: Factors involved in correct operation of mechanical atomizer type of oil burner. Dec. 15: Care and inspection of burners; relation of efficiency to capacity; draft requirements.

**Burners.** What the Oil Burner and the Oil Industries Can Do for Each Other and for the Public, G. I. Sweney. Am. Petroleum Inst.—advance paper, for meeting Dec. 11-13, 1923, 6 pp. Problems for domestic heating, etc. See also paper by F. P. Bailey for same meeting, 5 pp.

**Burning.** The Correct Versus the Incorrect Method of Using Fuel Oil, H. A. Anderson. Southern & Southwestern Ry. Club, vol. 17, no. 5, Sept. 1923, pp. 14, 17-18, 21-22, 25 and (discussion) 25-26, 29-30 and 33. Discusses burners, furnaces, and methods of feeding liquid fuel to burners; examples showing big saving that can be effected by using modern scientific oil-burning equipment.

**Locomotives.** The Burning of Fuel Oil in Railroad Locomotives, J. M. Johnston. Am. Petroleum Inst.—advance paper, for meeting Dec. 11-13, 1923, 13 pp. Includes list of important roads using fuel oil; locomotive fuel and Mexican oil; dependability of supply; advantages of burning oil vs. coal; cost of coal and oil at source; cost of transportation—coal and oil; cost of handling, and other costs.

**Solid Fuels, Production from.** Coal and the Problem of Liquid Fuels (La houille et le problème des combustibles liquides), E. Audibert. Chimie & Industrie, vol. 10, no. 4, Oct. 1923, pp. 613-631, 6 figs. Synthetic production of liquid fuels from solid fuels.

### OXY-ACETYLENE WELDING

**Aluminum.** Welding Aluminum. Sheet Metal Worker, vol. 14, no. 22, Nov. 23, 1923, pp. 827-828. Difficulties to be overcome; fluxes to be used; explains preparations for work and welding operation.

**Cast Iron.** Accurate Cutting on Cast Iron. Welding Engr., vol. 8, no. 11, Nov. 1923, pp. 19-22, 9 figs. Describes cuts made by oxy-acetylene torch on cast-iron of a seven-story building, in order to move it.

**Coal Driers.** Huge Coal Dryer Oxy-Acetylene Welded, T. C. Fetherston. Am. Welding Soc.—Jl., vol. 2, no. 11, Nov. 1923, pp. 25-28, 4 figs. Describes oxy-acetylene welding as carried out in connection with construction of a coal drier at a plant in southeastern Pennsylvania, for joining steel plates which compose outer shell and internal flue and attaching circular head permanently fitted in one end.

**Metal Appliances.** Oxy-Acetylene Welding of Metal Appliances. Sheet Metal Worker, vol. 14, no. 23, Dec. 7, 1923, pp. 866-867, 4 figs. Application of this type of welding in making tanks, stills and the like.

## P

### PAINTS

**Lithopone.** United States Government Specification for Gloss Interior Lithopone Paint, White and Light Tints. U. S. Bur. Standards, Federal Specifications Board, Standard Specification No. 67, Sept. 10, 1923, 8 pp. Specification officially adopted by Federal Specifications Board on Sept. 1, 1923, for use of Departments and Independent Establishments of Government in purchase of this paint, covering sampling, laboratory examination, analysis of pigment, and reagents.

### PATTERNMAKING

**Gears.** Pattern Making on Helical or Herring-bone Gear, Joseph Caslin. Can. Foundryman, vol. 14, no. 11, Nov. 1923, pp. 25 and 34, 1 fig. Purpose of this type of gear; laying out and locating teeth; necessity of each tooth being a segment of a perfect screw; stripping plate recommended.

### PISTON RINGS

**Compound.** A New Compound Piston Ring. English Mechanics, vol. 118, no. 3058, Nov. 2, 1923, p. 197, 1 fig. Account of Whiddbourne ring, an original type which combines uniformity of wall pressure with gas-tightness even after much wear.

**Design and Practice.** Modern Piston Ring Practice Involves Efficient Design and Production, P. M. Heldt. Automotive Industries, vol. 49, nos. 23 and 24, Dec. 6 and 13, 1923, pp. 1142-1146, 6 figs., and 1204-1208, 5 figs. Reviews development of modern piston ring practice and gives constructive ideas about relative efficiency of various design features.

### PLANERS

**Switch.** New Switch Planer. Iron Age, vol. 112, no. 22, Nov. 29, 1923, pp. 1143-1144, 3 figs. Machine for production work on heavy switches; massive construction and convenient control.

### POWER

**Combined Purchased and Generated.** The Combined Use of Self-Generated and Purchased Power with Simultaneous Waste-Heat Consumption (Ueber das Zusammenwirken von Eigenkraftezeugung und Fremdstrombezug bei gleichzeitigem Abwärmebedarf), M. Hirsch. Wärme, vol. 44, no. 43, Oct. 26, 1923, pp. 469-471, 5 figs. Power and heat conditions in leather factory using its own and purchased power; use of sufficient purchased current to insure a maximum utilization of exhaust steam, with and without waste-heat storage.

### POWER PLANTS

**Economy.** Power Plant Management, Robert June. Elec. Light & Power, vol. 1, nos. 8, 9, 10 and 12, Aug., Sept., Oct. and Dec. 1923, pp. 37-39 and 43-44; 22-24, 54 and 64; 31-32, 68-71 and 75; and 52, 71-72 and 78, 16 figs. Classification of coals; comparison of different ranks; moisture in coal; ash; influence of size on boiler efficiency; combustion space required for various coals; purchasing pointers; chemistry of combustion; air required for combustion; combustion losses; heat balance; draft for different fuels; control of draft, etc.

**Equipment, Power Show, New York.** Second Power Show Opens. Power, vol. 58, no. 23, Dec. 4, 1923, pp. 904-909. Details and list of exhibits.

**Problems.** Power Plant Problems as Viewed by Designers, Operators and Manufacturers. Power, vol. 58, no. 23, Dec. 4, 1923, pp. 881-882. Discussion of problems confronting power-plant field by designers, operators and manufacturers; dealing with shortcomings and apparent difficulties of existing methods, machinery and material.

### PRESSES

**Hydraulic.** What Can Be Done with High Pressures in the Chemical Engineering Industries, Chas. L. Mantell. Chem. & Met. Eng., vol. 29, no. 23, Dec. 3, 1923, pp. 1015-1018, 10 figs. How hydraulic press solves difficult production problems in mechanical separation of liquids and solids.

### PRODUCER GAS

**Study of.** Producer-Gas and Gas-Producer Practice, R. V. Wheeler. Fuel in Sci. & Practice, vol. 2, nos. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 and 11, Jan.-Feb., Mar., Apr., May, June, July, Aug., Sept., Oct., Nov. and Dec. 1923, pp. 15-21, 48-53, 72-77, 106-110, 156-160, 219-221, 269-272, 293-296, 334-338 and 369-372, 41 figs. Definition of producer gas and gas producer; chemical reactions taking place within producer; action of air upon carbon; action of carbon dioxide and of steam upon carbon; relative rates of reactions within gas producer; ash, combustion, reaction and distillation zones within producer; temperature distribution; producer construction, and types of producers; slagging gas producers; composition of producer gas; producer gas as a furnace fuel; value of different combustible

gases as fuel; efficiency of gas-producing plant; "gross" and "net" calorific values; radiation and other losses; choice of fuel.

### PSYCHOLOGICAL TESTS

**Vocational Men and Regular Students.** The Performance of Vocational Men and Regular Students on Three Types of Psychological Test, John A. McGeech. Wash. Univ. Studies, vol. 10, no. 2, Jan. 1923, pp. 67-85. Results of comparison show that, although scores on tests are uniformly higher for regular students, those of vocational men fall well within limits of normal performance on all tests. Bibliography.

### PULVERIZED COAL

**Boiler Firing.** Boiler Firing with Pulverized Coal at the Bruay Central Station [Chauffage des chaudières au charbon pulvérisé (Centrale électrique de Bruay)], M. Sohm. Revue de l'Industrie Minière, no. 68, Oct. 15, 1923, pp. 561-586, 15 figs. Degree of inflammability of pulverized fuel in hoppers; cost of steam per ton; flexibility of vaporization; amount and nature of ash collected; etc.

**Pulverized Fuel.** Eng. & Boiler House Rev., vol. 37, no. 4, Oct.-Nov. 1923, pp. 96 and 98, 1 fig. Brief description of huge installation being erected at Vitry power station in Paris, as illustrating remarkable developments in pulverized-fuel firing made in United States during past two or three years.

**Fineness Testing.** Determination of the Fineness of Powdered Coal, W. A. Selvig and W. L. Parker. U. S. Bur. of Mines—Reports of Investigations, no. 2545, Nov. 1923, 14 pp. Results of sieving tests on two standard samples of pulverized coal; as result method for making fineness tests, by hand sieving, is recommended as standard method, while rapid method, by machine sieving, is given for routine tests.

**Power Plants.** Notes on Pulverized Coal as a Fuel in Practice, A. E. Val Davies. S. A. Inst. Elec. Engrs.—Trans., vol. 14, part 9, Sept. 1923, pp. 162-170 and (discussion) 170-172. Résumé of present position of pulverized-coal and power-supply industry; notes on coal driers, milling or grinding; conveying and feeding; present developments.

**Turbo-Pulverizer.** Development in Powdered Fuel Firing, J. S. Atkinson. Elec. Times, vol. 64, no. 1673, Nov. 8, 1923, pp. 475-477, 8 figs. Contrasts turbo-pulverizer unit with central system, and replies to criticisms of pulverized-fuel firing.

### PUMPING

**Pneumatic.** Pneumatic Pumping Up to Date, John Oliphant. Am. Water Works Assn.—Jl., vol. 10, no. 6, Nov. 1923, pp. 1082-1087, 3 figs. Experience of several years' work in pumping water from wells with compressed air.

### PUMPS

**Mine, Metals for.** Metals Must Resist Corrosion, C. A. Drysdale. Foundry, vol. 51, no. 23, Dec. 1, 1923, pp. 952-954. Points out that pumps in mines handling acidified waters require special metals; alloys should be free from zinc; tests under working conditions give different results from those made in laboratory.

**Priming, Interceptor for.** The Seaborne "Interceptor" for the Priming of Pumps, C. J. H. Penning. Int. Sugar Jl., vol. 25, no. 299, Nov. 1923, pp. 584-586, 5 figs. Particulars of Seaborne "Interceptor," which provides means whereby a centrifugal or rotary pump is kept permanently primed, while there are no restricted passages in suction main, no fine adjustments, and no valves; is a receptacle placed in suction pipe line just above pump housing.

### PUMPS, CENTRIFUGAL

**Pump and Paper Stock Handling.** Centrifugal Pumps for Handling Pump and Paper Stocks at Various Consistencies, R. W. Pryor, Jr. Paper Trade Jl., vol. 77, no. 22, Nov. 29, 1923, pp. 43-45, 4 figs. Discusses essentials of a satisfactory pump to serve a papermaker, viz., dependability, accessibility, efficiency and interchangeability; description of Buffalo pump.

### PUNCHING MACHINES

**Table for.** A One-Man Punching Table. Engineer, vol. 136, no. 3542, Nov. 16, 1923, p. 639, 3 figs. Describes new British type of punching table which, it is claimed, possesses all advantages of one-man punching machine, and is capable of being adapted to any existing punch.

### PYROMETERS

**Optical and Radiation.** Optical and Radiation Pyrometry, R. S. Whipple. Birmingham Met. Soc.—Jl., vol. 8, no. 8, 1923, pp. 360-378 and (discussion) 378-381, 8 figs. Deals with types of pyrometers which have proved suitable for industrial use.

**Smoked Glasses, Use in Measurements.** The Use of Smoked Glasses in Optical-Pyrometrical Measurements (Ueber den Gebrauch von Rauchgläsern bei optisch-pyrometrischen Messungen), Fr. Hoffmann. Zeit. für Physik, vol. 17, no. 1, July 30, 1923, pp. 1-2, 6 figs. It is shown how pyrometrical weakening of smoked glasses when used on Holborn-Kurlbaum pyrometers can be calculated from spectral permeability of the smoked glass and the ocular filter employed, when light shining through pyrometer is no longer monochromatic.

## R

### RAILWAY ELECTRIFICATION

**Economics.** Some Aspects of Railway Electrification, E. Marshall. West. Soc. Engrs.—Jl., vol. 28, no. 11, Nov. 1923, pp. 485-488 and (discussion) 488-490. Author raises question as to why railroads have not

further extended electrification of those projects that have been successful in past; discusses economics of question.

**Europe.** The Electrification of Foreign Railways, S. Parker Smith. Beama, vol. 13, nos. 63, 65 and 67, July, Sept. and Nov. 1923, pp. 20-29, 158-166 and 298-303, 7 figs. July: Switzerland: use of direct-current, 3-phase and single-phase systems. Sept. Italy: d.c. and 3-phase systems; locomotives; results. Nov.: Scandinavian countries.

**France.** Electrification of the Midi Railway (Note sur l'Electrification des Chemins de Fer du Midi), P. Leboucher and H. Ledoux. Revue Générale des Chemins de Fer, vol. 42 (1st Half), nos. 3, 5, 6 and vol. 42 (2d Half), nos. 1 and 2, Mar., May, June, July and Aug. 1923, pp. 181-225, 373-386, 461-481, 3-14 and 61-79, 106 figs. Program of electrification; power stations; high-tension lines, insulators, poles, protection against excess voltage, etc.; substations; electric locomotives; etc.

Electrification of the Midi Railway. Ry. Gaz. vol. 39, no. 22, Nov. 30, 1923, pp. 695-696. Summary of paper read to French Soc. Civ. Engrs., British Section, Nov. 22, 1923, by A. Pachellery, describing electrification work now in progress.

First Stage of the Program of Partial Electrification of the Paris, Lyons and Mediterranean System (Note sur la première étape du programme d'électrification partielle du réseau P. L. M.), M. Japiot. Revue Générale des Chemins de Fer, vol. 42, no. 5, Nov. 1923, pp. 291-321, 15 figs. Details regarding electrification of line from Culoz to Modane, and lines in vicinity of Nice.

**Systems and Methods.** Systems and Methods of Railway Electrification, H. M. Sayers. Elec. Times, vol. 44, no. 1674, Nov. 15, 1923, pp. 507-509, 4 figs. Discusses problems of electrification, with special regard to British conditions.

#### RAILWAY EQUIPMENT

**Tools for Maintenance.** Tool Equipment for Bridge, Building and Water Service. Ry. Eng. & Maintenance, vol. 19, no. 12, Dec. 1923, pp. 495-497, 2 figs. Comprehensive lists of devices and appliances used by railway maintenance forces.

#### RAILWAY MANAGEMENT

**Stores and Mechanical Departments, Coöperation.** Relation of Stores and Mechanical Departments, F. M. A'Hearn. Ry. Mech. Engr., vol. 97, no. 12, Dec. 1923, pp. 834-838, 9 figs. Describes practice of Bessemer & Lake Erie, Greenville, Pa., in handling certain stocks of material; method of handling firebox renewals; system for delivering material; disposal of scrap material.

#### RAILWAY MOTOR CARS

**Diesel-Electric.** Ten Years' Diesel-Electric Railroad Experience, Thos. Orchard Lisle. Oil Engine Power, vol. 1, no. 11, Nov. 1923, pp. 529-537, 11 figs. Details of what has been done in Sweden on adoption of Diesel-electric cars for branch lines, since first car was put into operation ten years ago; 20 units of various sizes, from 75 hp. to 250 hp., now in service; advantages of Diesel-electric system; cost data.

**Drewry.** Silent Chain Final Drive is Used on Drewry Locomotives, M. W. Bourdon. Automotive Industries, vol. 49, no. 23, Dec. 6, 1923, pp. 1152-1154, 2 figs. 4- and 6-cylinder engines are of more rugged construction than those generally employed in truck service; gearset has two parts of constant mesh gears; controls duplicated at each end.

**Gasoline.** Gasoline Motor Train for the Mississippi Central Ry. Ry. Rev., vol. 73, no. 21, Nov. 24, 1923, pp. 781-783, 7 figs. Rail motor car and trailer which is to be operated at two-unit train in branch-line service.

Gasoline Railway Motor Cars [Automotrices à moteur thermique (explosion ou combustion interne)]. Industrie des Tramways, vol. 17, no. 202, Oct. 1923, pp. 395-402, 7 figs. Particulars of tests of Berliet and Renault-Scania cars.

**Renault.** The New Renault-Scania Railway Motor Car (La nouvelle automotrice Renault-Scania). Génie Civil, vol. 83, no. 15, Oct. 13, 1923, pp. 337-340, 8 figs. Details of new type with capacity for 40 passengers which has been submitted to series of tests with successful results; can be adapted to standard and narrow-gauge roads.

**Steam.** Steam Motor Coach on the Jersey Railways. Tramway & Ry. J., vol. 54, no. 24, Nov. 15, 1923, pp. 260-262, 5 figs. Design and operating data of car on system of Jersey Railways & Tramways, Ltd.; runs a distance of four miles with six intermediate stops, with a scheduled timing for the single journey of 15 min.

**Two-Car Trains.** Two-Car Motor Train for Mississippi Central. Ry. Mech. Engr., vol. 97, no. 12, Dec. 1923, pp. 830-832, 7 figs. Chassis, of 4-wheel-drive type, and trailer provide baggage space and seats for 46 passengers.

#### RAILWAY OPERATION

**Fuel Economy.** Fundamentals of Fuel Economy, W. L. Richards. Ry. Age, vol. 75, no. 22, Dec. 1, 1923, pp. 999-1003. Discusses the three elements entering into economical use of fuel, viz., operation, mechanical factors, and personnel.

**Train Despatching.** Recent Developments in Telephone Equipment for Train Despatching Circuits, Wm. H. Capen. Elec. Communication, vol. 2, no. 2, Oct. 1923, pp. 111-140, 22 figs. Outline of history up to present time; transmission requirements of despatching circuits as compared to those of ordinary telephone circuits; effect of electrical characteristics of line, number of sets, etc., on proper design for maximum efficiency; "standing waves;" diagrams of circuits for despatcher's and waystation sets; development of vacuum-tube amplifier with loud speaker for despatcher and way-station use; practical application and limitations of present train despatching apparatus; appendix

giving development of mathematical formulas used in design of apparatus. From paper read at Am. Ry. Assn. convention.

#### RAILWAY SHOPS

**Locomotive.** Shop Reorganization at Swindon Works. Great Western Railway. Ry. Gaz., vol. 39, no. 22, Nov. 30, 1923, pp. 685-692, 14 figs. Improvement in methods and greater expedition in completing work effected at locomotive works, by regrouping certain appliances and thereby centralizing specified operations, together with introduction of new machine tools.

#### RAILWAY TRACK

**Track Laying.** Laying a Mile of Rail Per Hour Under Traffic. Ry. Age, vol. 75, no. 23, Dec. 8, 1923, pp. 1047-1050, 9 figs. Methods employed by Can. Pacific in laying over 100 mi. of 100-lb. rail under traffic; laid in units of two rails by double tong gangs consistently at rate of 20 to 21 sec. per rail.

#### REAMERS

**Taper.** Piloted Machine Taper Reamers, Frederic Cooke. Machy. (Lond.), vol. 23, nos. 579 and 581, Nov. 1 and 15, 1923, pp. 139-142, and 202-204, 6 figs. Reamers are divided into their three main parts, namely, pilot, tooth, and shank, each of which is considered separately.

#### REFRACATORIES

**Steel Industry.** Refractories in the Steel Industry, J. Spotts McDowell. Blast Furnace & Steel Plant, vol. 11, nos. 10 and 11, Oct. and Nov. 1923, pp. 525-529 and 569-574, 10 figs. Clay, silica, firebrick, high-alumina and magnesite refractories; properties.

#### REFRIGERATING MACHINES

**Lubrication.** Lubrication of Refrigeration Machinery. Lubrication, vol. 9, no. 10, Oct. 1923, pp. 109-120, 20 figs. Discusses operating conditions of ammonia, carbonic anhydride and other refrigerants, as they involve lubrication.

#### REFRIGERATING PLANTS

**Ammonia Compressors.** Compression Curves for Ammonia Compressors, Wm. D. Jack. Ice & Refrigeration, vol. 65, nos. 1, 2, 3, 4 and 5, July, Aug., Sept., Oct. and Nov. 1923, pp. 17-19, 79-81, 135-137, 198-200 and 262-264, 2 figs. Adiabatic, isothermal, saturation and saturated-compression curves for ammonia machine; thermodynamic formulas; fundamental constants and relationships; mean effective pressure formulas.

**Ammonia Condensers.** Performance Tests on a Flooded Atmospheric Type Ammonia Condenser, H. J. Macintire and Earl Belling. Refrig. Eng., vol. 10, no. 3, Sept. 1923, pp. 87-90 and (discussion) 90-91 and 93, 8 figs. Results of tests carried out to find out action of ammonia in a flooded condenser, coefficient of heat transfer and function of condensing water.

**Tests.** Testing an Ammonia Refrigerating Plant, Chas. H. Herter. Power, vol. 58, no. 22, Nov. 27, 1923, pp. 846-849, 2 figs. Running of tests; evaporating system; condenser records; computed efficiencies; observations and deductions from tests made on 125-ton plant.

#### REFRIGERATION

**Gas, Cooling with.** Producing Cold with Gas, H. DeWitt Valentine. Am. Gas J., vol. 119, no. 28, Dec. 15, 1923, pp. 629-631 and 642-644, 4 figs. How gas is used in refrigeration. Read before Am. Gas Assn.

#### RESEARCH

**Scientific, Relation to Industry.** Science and Industry in America, Walter Rosenhain. Engineer, vol. 136, nos. 3533, 3534, 3535, 3536, 3537, 3538, 3539, 3540, 3541 and 3542, Sept. 14, 21, 28, Oct. 5, 12, 19, 26, Nov. 2, 9 and 16, 1923, pp. 270-271, 298-299, 5 figs.; 330-331, 1 fig.; 358-359, 384-385; 412-413; 440-441; 468-469; 494-496, 5 figs.; and 522-524, 3 figs. Discusses attitude of industry toward scientific research and of scientific investigators towards industry. Applications of science and scientific methods in some typical industrial and governmental establishments and work done in this connection in some American colleges and universities.

#### ROLLING MILLS

**Continuous.** Rolling Mill Practice, T. Price. Metal Industry (Lond.), vol. 23, nos. 22 and 23, Nov. 30 and Dec. 7, 1923, pp. 493-494 and 516-518. Details and advantages of Morgan continuous mill, which combines Acme and Morgan skelp mills; action and design of rolls. Paper read before Staffordshire Iron & Steel Inst.

**Plate.** Scotch Build a New Plate Mill, Jos. Horton. Iron Trade Rev., vol. 73, no. 21, Nov. 22, 1923, pp. 1421-1426, 9 figs. New mill at plant of Dav. Colville & Sons, Glasgow, has capacity of 3000 tons weekly; furnaces and rolls reflect departures from conventional design.

**Practice.** Rolling-Mill Practice, T. Price. Iron & Coal Trades Rev., vol. 107, no. 2907, Nov. 16, 1923, pp. 727-728. Cogging and finishing mills; need for correctly designed rolls; effect of rolling on material; designing of rolls; points to watch in designing rolls; diagonal designing. (Abstract.) Paper read before Staffordshire Iron & Steel Inst.

**Rod Mill.** New Rod Mill for Wire and Cable Plant, Iron Age, vol. 112, no. 23, Dec. 6, 1923, pp. 1505-1507, 5 figs. Tonnage unit of combined continuous and looping type installed for rolling both steel and copper, at Kinkora plant, Roebing, N. J.

**Sheet Mills.** "National Enamel" Problem Demands Uninterrupted Control of Elements, F. J. Crolius. Blast Furnace & Steel Plant, vol. 11, no. 12, Dec. 1923, pp. 620-623, 7 figs. Methods and equipment of new sheet mills at Granite City, Ill.

**Strip Mills.** Hot Strip Capacity Is Augmented.

Iron Trade Rev., vol. 73, no. 24, Dec. 13, 1923, pp. 1609-1611, 4 figs. Pittsburgh district producer completes new unit at Leechburg, Pa. which will permit scheduling of wide sizes and light gages; mill arrangement affords rolling both ways of grain; details of installation. See also Iron Age, vol. 112, no. 24, Dec. 13, 1923, pp. 1581-1583, 5 figs.

## S

#### SAND, MOLDING

**Silica Sand.** Use of Silica Sand for Steel Foundry Purposes, L. Heber Cole. Cement, Mill & Quarry, vol. 23, no. 9, Nov. 5, 1923, pp. 31-32. Its bonding power, permeability, and refractoriness; silica sand for furnace linings.

#### SCREW THREADS

**Milling.** Producing Accurate Threads by Milling Process, H. P. Arlson. Can. Machy., vol. 30, nos. 19, 20 and 21, Nov. 8, 15 and 22, 1923, pp. 18-21, 22 and 33, and 13-17, 8 figs. General description of principles, methods and advantages of thread milling, with data on cutter design, and recommended speeds and feeds for cutting various materials.

#### SEAPLANES

**Seaworthiness.** The Design of Marine Aircraft in Relation to Seaworthiness, D. F. Lucking. Roy. Aeronautical Soc.—Jl., vol. 27, no. 155, Nov. 1923, pp. 535-552. Describes disabilities from which various types of marine aircraft suffer in regard to seaworthiness. Bibliography.

#### SEMI-DIESEL ENGINES

**Vickers-Petters.** The Largest Vickers-Petters' Engine in Ireland. Power Engr., vol. 18, no. 212, Nov. 1923, p. 410, 1 fig. 510-b.hp. Semi-Diesel engine erected at Dundalk municipal power plant.

#### SHAFTS

**Fits.** Fits, H. P. Phillips. West. Machy. Wld., vol. 14, no. 11, Nov. 1923, pp. 357 and 362. Describes practice of Meese & Gottfried Co., San Francisco, Cal., who are called upon to bore for various classes of shaft fits from 6000 to 8000 iron castings used in transmission and conveying machinery.

#### SHAPERS

**Automatic Bevel-Wheel.** Automatic Bevel Wheel Shaping Machines. Eng. Progress, vol. 4, no. 10, Oct. 1923, pp. 216-218, 4 figs. Describes shaping machine made by Zimmermann Works and points out advantages with regard to rapid and accurate production of bevel-wheel gearings, which are obtained by using described method of shaping profiles of teeth by means of templates.

**Gear Box Inside Column.** New Line of Shapers. Iron Age, vol. 112, no. 22, Nov. 29, 1923, pp. 1445-1446, 4 figs. New shapers known as Climax have gear box inside of column, automatic visible lubrication, and other improved features.

**Overhanging Gear Box.** New Line of Shapers Meets Variety of Needs. Automotive Industries, vol. 49, no. 24, Dec. 13, 1923, pp. 1211-1212, 2 figs. Overhanging gear box eliminated in new models brought out by Cincinnati Shaper Co.; automatic, visible-type lubrication.

#### STANDARDIZATION

**Variety vs. Extreme Variety Versus Standardization.** L. A. Hawkins. Indus. Management (N. Y.), vol. 66, no. 6, Dec. 1923, pp. 327-334, 12 figs. Research at Gen. Elec. Co. and its effect on variety.

#### STEAM ENGINES

**Corliss.** Erecting a Corliss Engine, Guy Edwards. Southern Engr., vol. 40, no. 3, Nov. 1923, pp. 51-54, 18 figs. Handling flywheel, crankshaft and engine bed from car to foundation in plant; methods employed in handling stator of direct-connected units.

**Steam Consumption.** Steam-Consumption and Performance Tests on Reciprocating Steam Engines and Steam Turbines in 1922 (Dampfverbrauchs- und Leistungsveruche an Kolbendampfmaschinen und Dampfturbinen in Jahre 1922). Zeit. des Bayerischen Revisions-Vereins, vol. 27, nos. 18 and 19, Sept. 30 and Oct. 15, 1923, pp. 137-142 and 150-151. Results of tests shown in tables.

The Steam Consumption of Sugar Factory Engines, P. H. Parr. Int. Sugar J., vol. 25, no. 299, Nov. 1923, pp. 578-583. Discusses the three most common steam pressures used in sugar factories, viz., boiler pressure, pressure at engine, and back pressure; mean effective pressure in lb. per sq. in., and steam consumption in lb. per b.hp., at a normal piston speed of 350-400 ft. per min.; other figures.

#### STEAM METERS

**Throttling-Disk.** Transmission of Pressure from the Throttling Point in Steam Pipes to the Steam Meter (Uebertragung des Druckes von der Drosselstelle in Dampfrohrlungen auf Dampfmesser), Hugo Ombeck. Wärme, vol. 46, no. 41, Oct. 12, 1923, pp. 449-450, 6 figs. Points out that in steam meters with throttling disk, proper transmission of pressure from throttling disk to measuring instrument is necessary for perfect results; shortcomings in present types of connecting links; recommends new solution through use of double container.

#### STEAM TURBINES

**Efficiency.** Behavior of Turbines with Variable Quantities of Steam with Throttle Control (Turbines förhållande vid variabel ångtillförsel, speciellt stry-preglerade), Matts Bäckström. Teknisk Tidskrift,

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

(Mekanik) vol. 53, nos. 24 and 29, June 16 and July 21, 1923, pp. 61-65 and 73-76, 14 figs. Investigation of efficiency at different steam pressures; calculations, and diagrams of pressures; change of heat drop with steam pressure; etc.

Maximum Commercial Efficiency of Steam Turbines, Rob. Dowson. Beama, vol. 13, no. 68, Dec. 1923, pp. 359-365, 2 figs. Relation between thermodynamic efficiency and "Parsons coefficient."

High-Pressure. New Methods in the Construction of Steam Turbines (Neue Wege des Dampfturbinenbaues), W. G. Noack. Elektrischer Betrieb, vol. 21, no. 19, Oct. 10, 1923, pp. 221-223, 5 figs. Describes design of BBC high-pressure turbine, constructed by Brown, Boveri & Cie., which operates with high-pressure and highly superheated steam up to 100 atmos. and 450 deg. cent. Abstracted from BBC-Mitteilungen, May 1923.

Repairing. Correcting Trouble in Small Steam Turbines, R. A. Cultra. Power Plant Eng., vol. 27, no. 24, Dec. 15, 1923, pp. 1221-1223, 6 figs. Deals with oil troubles; sprung shaft or rotor; repair work in plant.

Specifications. Turbine Specifications and Bid for Detroit Municipal Plant. Power, vol. 58, no. 22, Nov. 27, 1923, pp. 844-845. Specifications intended to provide for all labor and materials necessary to furnish turbo-generator units specified.

Torsionmeters. Position of. The Accuracy of Torsionmeters. Mar. Engr. & Nav. Architect, vol. 46, no. 555, Dec. 1923, p. 449, 1 fig. Discussion as to best position for them along line of shafting.

## STEEL

Alloy. See ALLOY STEELS.

Classification and Selection. Classification and Selection of Steel, H. B. Knowlton. Forging—Stamping—Heat Treating, vol. 9, no. 11, Nov. 1923, pp. 467-471. Various grades of steel classed according to composition and method of manufacture together with complete review of their properties and applications.

Cold Working. Operations in the Cold Working of Steel. Machy. (Lond.), vol. 23, no. 580, Nov. 8, 1923, pp. 161-167, 23 figs. Machines and methods employed by Arthur Lee & Sons, Sheffield, in manufacture of bright cold-drawn bar, wire, and cold-rolled strip.

Decarburization. Observations on Decarburization, and Nitrogen and Silicon Absorption in the Annealing of Iron and Steel at 1100 to 1300 Deg. Cent. in Pure Nitrogen Stream (Beobachtungen über das Entkohlen, über Stickstoff- und Siliziumaufnahme beim Glühen von Eisen bei 1100 bis 1300° in reinen Stickstoffstrom), P. Oberhoffer and A. Heger. Stahl u. Eisen, vol. 43, no. 48, Nov. 20, 1923, pp. 1474-1476, 4 figs. Time-concentration curves; influence of nitrogen on decarburization and silicon absorption.

High-Speed. See STEEL, HIGH-SPEED.

Manganese. See MANGANESE STEEL.

Rail. A Comparison of the Decarburization Effects of Titanium and Silicon on the Properties of Rail Steel, G. K. Burgess and G. W. Quick. U. S. Bur. Standards, Technologic Papers, no. 241, Oct. 1, 1923, pp. 581-635, 27 figs. Results of investigation on two series of heats of rail steel, one being finished with additions of ferro-silicon and ferromanganese in ladle and other with ferromanganese split between furnace and ladle with ferro-carbon-titanium added in ladle, planned on basis of a study of manufacture, tests of A rails, and service results of 1000 tons each of titanium-treated and silicon-treated steel.

Silicon. Effect of. The Effect of Silicon on the Thermal Critical Points of Steel, F. L. Meacham. Am. Soc. Steel Treating—Trans., vol. 6, no. 5, Nov. 1923, pp. 635-640, 13 figs. Investigation to ascertain position of points A<sub>1</sub>, A<sub>2</sub>, and A<sub>3</sub> in iron-carbon-silicon steel and to compare position of these points with those of pure iron-carbon alloys.

Tellurium in. Properties of Steel Containing Tellurium, G. B. Waterhouse and I. N. Zavarine. Iron Age, vol. 112, no. 24, Dec. 13, 1923, pp. 1575-1576, 5 figs. Experimental heat of cast steel; forging qualities and structure; tellurium present as telluride.

Tool. See TOOL STEEL.

## STEEL CASTINGS

Manganese. Specializes in Manganese Steel, H. E. Diller. Iron Trade Rev., vol. 73, no. 25, Dec. 20, 1923, pp. 1672-1677, 9 figs. Methods and equipment of foundry at High Bridge, N. J., which successfully turned from production of car wheels and axles to manufacture of manganese steel castings; ferromanganese melted in cupola for converter steel; electric furnace also employed.

Ship. The Manufacture of Heavy Steel Castings for Ships, with Special Reference to Stern Frames, Rudders, Shaft Brackets and Stems, Hugo P. Frear. Soc. Nav. Architects & Mar. Engrs.—advance paper, no. 8, for meeting Nov. 7-8, 1923, 21 pp., 51 figs. on supp. plates. Deals with shrinkage, design, patterns, sand, cores, flasks, molding, ladle and tapping, pouring, defects, welding, shaking out and cleaning, annealing, and straightening; molding of stern frame for U. S. S. Lexington. See abstract in Mar. Eng., vol. 28, no. 12, Dec. 1923, pp. 754-757.

## STEEL, HEAT TREATMENT OF

Annealing Sheet Metal. Annealing Sheet Metal for Stamping, P. G. White. Blast Furnace & Steel Plant, vol. 11, no. 12, Dec. 1923, pp. 637-642, 11 figs. Chemical composition of sheets; laboratory study of annealing; mill study—cannon-ball type furnace; hand-fired vs. stoker-fired furnaces; blue annealing. Includes tables giving results of Erichsen's tests.

Bath. New Heat Treatment Bath Permits Handling of Parts in Finished Form. Automotive Industries, vol. 49, no. 23, Dec. 6, 1923, p. 1147, 2 figs. Describes new form in which tools or parts may be treated in

finished shape without deformation, oxidation or decarbonizing; developed by Bellis Heat Treating Co.

Methods. Heat-Treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 23, no. 583, Nov. 29, 1923, pp. 268-271, 1 fig. Automobile and general springs; considers physical effects produced by varying both quenching temperature and drawing/heats permissible.

Salt Baths. Value of Salt Baths for Heat Treating, C. B. Bellis. Forging—Stamping—Heat Treating, vol. 9, no. 11, Nov. 1923, pp. 480-481, 3 figs. Important characteristics of salt baths are melting point, heat conductivity, specific heat and viscosity; urges baths for treating high-speed steel.

## STEEL, HIGH-SPEED

Tempering. The Tempering of High-Speed Steels and Their Electrical Resistivity (La trempe des aciers à outils à coupe rapide et leur résistivité), L. Guillet. Revue de Métallurgie, vol. 20, no. 10, Oct. 1923, pp. 656-664, 16 figs. Results of tests showing influence of tempering temperature and period of heating before tempering on resistivity and hardness.

## STOKERS

Mechanical. A Crosthwaite Mechanical Stoker. Power Engr., vol. 18, no. 212, Nov. 1923, pp. 422-423, 1 fig. New improved type of stoker and self-cleaning furnace.

## STRAIGHTENING MACHINES

Round Bars and Tubes. Continuous Straightening Machines for Round Bars and Seamless Tubes. Iron & Coal Trades Rev., vol. 108, no. 2908, Nov. 23, 1923, p. 771, 4 figs. Straightening machine for small sections; continuous straightening machines for heavy sections; straightening machines for seamless tubes.

## STREET RAILWAYS

Cars, Emergency Braking on. Emergency Braking on Electric Cars, D. D. Ewing. Purdue Univ.—Bul., vol. 7, no. 7, July 1923, 162 pp., 89 figs. Report presented to Central Elec. Ry. Assn. of tests made on four electric cars; description of equipment tested, theoretical considerations, and discussion of tests results.

Cars, Light-Weight. Experience Shows Light Cars Increase Net of Interurban Lines, C. T. DeHore. Elec. Ry. J., vol. 62, no. 22, Dec. 1, 1923, pp. 927-930, 3 figs. Analysis of operating results on several properties over period of six years showing material reduction in operating costs as compared with heavy cars; light cars take less power and can make schedules better; revenue increases have followed improvements in service made possible.

## SUPERHEATED STEAM

Superheating Principles. The Economy of Superheated Steam. Eng. & Boiler House Rev., vol. 37, no. 4, Oct.-Nov. 1923, pp. 100 and 103-104, 2 figs. Elementary facts concerning superheating.

## SYMBOLS

Construction Engineering. Standard Terms and Symbols for Construction Engineering (Einheitliche Bezeichnungen für die Entwürfe von Ingenieurbauwerken), H. Schaper. Bautechnik, vol. 1, no. 34, Aug. 10, 1923, pp. 332-333. Presents mathematical symbols, symbols for weight and measure units; terminology for expressions of mechanics and statics; and for dimensions, basic units and weights of steel superstructures; recommended for adoption by German authorities.

Heat and Steam. Report of Progress of Committee Number 20, on the Standardization of Technical Nomenclature. Eng. Education, vol. 14, no. 3, Nov. 1923, pp. 135-141. List of symbols for heat and steam. List of symbols in mechanics and hydraulics adopted by Soc. for Promotion of Eng. Education on June 28, 1918.

# T

## TEMPERATURE CONTROL

Automatic. An Automatic Temperature Control System. Power Engr., vol. 18, no. 213, Dec. 1923, pp. 454-456, 9 figs. Complete range of instruments and apparatus for automatic control of temperature in industrial processes developed by Cambridge & Paul Instrument Co.

## TERMINALS, RAILWAY

Freight and Engine. Michigan Central Completes its Niles, Mich., Yard. Ry. Rev., vol. 73, no. 22, Dec. 1, 1923, pp. 791-794, 7 figs. Larger freight and engine terminal provides better operating conditions.

## TESTING MACHINES

Temper Testing. The Pile Temper-Testing Machine, R. G. Johnston. Brass World, vol. 19, no. 11, Nov. 1923, pp. 353-355, 1 fig. Principle of design and method of operation of machine for testing or comparing temper of two pieces of thin non-ferrous strip or wire.

## THERMOMETERS

Katathermometers. A New Recording Katathermometer, E. H. J. Schuster. J. of Sci. Instruments, vol. 1, no. 1, Oct. 1923, p. 30. Notes on apparatus in which heating and cooling are carried out automatically and a tracing is made consisting of a horizontal line broken every quarter of an hour to give a record of elapsed time, and above this a series of vertical ordinates, each representing by its length number of seconds which instrument took to cool at time of day shown in horizontal line.

## TOOL STEEL

Tempering. The Tempering of Tool Steels, J. P. Gill and L. D. Bowman. Am. Soc. Steel Treating—Trans., vol. 4, no. 6, Dec. 1923, pp. 727-742 and (discussion) 742-747, 8 figs. Study of effect of time, temperature and mass on tempering of tool steels, including high-speed steels; it is shown that tempering colors can be produced on surface of piece of steel successively at low temperatures if held for sufficient length of time; molecular rearrangement takes place in hardened steels at atmospheric temperatures; discusses phenomenon of "temper brittleness" as it refers to steels.

## TOOLS

Precision, Manufacture of. Manufacturing a Precision Tool, E. Sheldon. Am. Mach., vol. 59, no. 25, Dec. 20, 1923, pp. 903-907, 12 figs. Preparatory operations on frames; threading main and adjusting nuts by tapping; rigid inspection methods.

# U

## UNEMPLOYMENT

International Association on. The General Assembly of the International Association on Unemployment. Int. Labour Rev., vol. 8, no. 5, Nov. 1923, pp. 680-695. General scheme for prevention of unemployment; organization of vocational guidance; emigration and overseas settlement of unemployed persons; reorganization of Association.

## UNIVERSAL JOINTS

Dies for Boot. Dies for Producing a Universal Joint Boot, N. T. Thurston. Machy. (N. Y.), vol. 30, no. 4, Dec. 1923, pp. 253-256, 13 figs. Blanking, drawing, trimming, piercing, flanging, and wiring operations.

# V

## VOCATIONAL TRAINING

Machinists and Draftsmen. Worth-while Vocational Training, George B. Frazee. Machy. (N. Y.), vol. 30, no. 4, Dec. 1923, pp. 289-293, 5 figs. Features of educational program of Grand Rapids vocational school for giving future machinists and draftsmen well-rounded knowledge of their trade.

# W

## WAGES

Work on Dangerous Machines. Wage Systems for Work on Dangerous Machines and Their Influence on Accident Prevention (Lohnsysteme an gefährlichen Arbeitsmaschinen und ihr Einfluss auf die Unfallverhütung), H. Kleditz. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 44, Nov. 3, 1923, pp. 1024-1027. Report on experiences in various industrial districts in Germany, from which it is shown that accidents are no more frequent with piece-rate than with hour-rate system.

## WASTE HEAT

Waste-Gas Utilization. Modern Waste-Gas Utilization Plants for the Production of Steam, Hot Water and Hot Air (Neuere Abgasausnutzungsanlagen zur Gewinnung von Dampf, Warmwasser und Warmluft), O. Brandt. Wärme, vol. 46, no. 44, Nov. 2, 1923, pp. 479-482, 5 figs. Discusses importance and possibilities of waste-gas utilization in industrial furnaces of different temperature ranges; use of waste-heat boilers, waste-gas preheaters and waste-gas pocket air heaters in connection with induced-draft installations.

## WATER WORKS

Pumping Stations. The Selection of Pumping Equipment from the Standpoint of Station Economy, Frank A. Mazzur. New England Water Works Assn.—Jl., vol. 37, no. 3, Sept. 1923, pp. 242-253 and (discussion) 253-260. Discusses turbine, electric, and oil-engine drive; comparison of operation costs of various types of pumping equipment.

## WEIGHING MACHINES

Milligram Loads. Two Machines for Rapidly Weighing Loads of a Few Milligrammes. Jl. of Sci. Instruments, Preliminary Number, May 1922, pp. 15-21, 14 figs. Describes the cantilever balance and the catenary balance, made for special purpose of sorting by weight small spiral filaments used in manufacture of gas-filled lamps.

## WELDING

See ELECTRIC WELDING; ELECTRIC WELDING, ARC; OXY-ACETYLENE WELDING.

## WIND POWER

Germany. Wind Power in Germany (Die Windkraft in Deutschland), Oscar Walter. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 46, Nov. 10, 1923, pp. 1037-1041, 9 figs. Note on wind intensity in Germany and detailed discussion of fluctuations in performance of wind-power plants; based on official data, gives annual wind-power output for several localities.

## WOOD PRESERVATION

Treatment Processes. How Wood Is Treated. Wood Preserving News, vol. 1, no. 10, Nov. 1923, pp. 179-181, 3 figs. Describes standard processes.

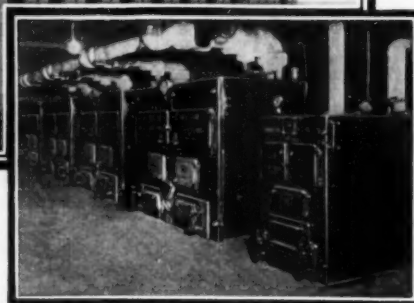

## Two architects and three engineers agreed on this heating plant

Masonic Temple, Birmingham, Alabama.

Warren, Knight and Davis, and Harry B. Wheelock, Birmingham, Associated Architects.

Warmed with four T-79-9 IDEAL Smokeless Water Tube Boilers. One T-29-10 for kitchen.

**B**IRMINGHAM'S beautiful Masonic Temple is warmed by a battery of four T-79-9 IDEAL Smokeless Tube Boilers.

Low pressure boilers for this handsome building were decided upon only after the most thorough consultation among the architects, Mr. H. B. Wheelock, and Warren, Knight and Davis of Birmingham, Mr. Ray S. Wilde, Consulting Engineer of Detroit, and the two engineers on the Building Committee.

The performance record of this battery of IDEAL 79" Boilers has thoroughly

vindicated the judgment of these architects and engineers. For Mr. F. B. Keiser, President of the Masonic Temple Association of Birmingham, writes: "We are pleased to advise that the boilers are satisfactory from a standpoint of fuel consumption, efficiency and splendid results derived from the individual units. One boiler carries the load in mild weather. We shall be glad to have you refer anyone to us for information."

If your files do not already carry complete information about the IDEAL 79" Boiler, write to either address below for a catalogue.

# AMERICAN RADIATOR COMPANY

*IDEAL Boilers and AMERICAN Radiators for every heating need*

104 W. 42d Street, New York

Dept. T-36

816 So. Michigan Avenue, Chicago

# THE ENGINEERING INDEX

(Registered United States, Great Britain and Canada)

**THE ENGINEERING INDEX** presents each month, in conveniently classified form, items descriptive of the articles appearing in the current issues of the world's engineering and scientific press of particular interest to mechanical engineers. At the end of the year the monthly installments are combined along with items dealing with civil, electrical, mining and other branches of engineering, and published in book form, this annual volume having regularly appeared since 1906. In the preparation of the Index by the engineering staff of The American Society of Mechanical Engineers some 1200 technical publications received by the Engineering Societies Library (New York) are regularly reviewed, thus bringing the great resources of that library to the entire engineering profession.

Photoprint copies (while printing on a black background) of any of the articles listed in the Index may be obtained at a price of 25 cents a page. When ordering photoprints identify the article by quoting from the Index item: (1) Title of article; (2) Name of periodical in which it appeared; (3) Volume, number, and date of publication of periodical; (4) Page numbers. A remittance of 25 cents a page should accompany the order. Order should be sent to the Engineering Societies Library, 29 West 39th Street, New York.

(See also page 172 of this issue for supplementary items.)

## ABRASIVE WHEELS

**Diamonds for Dressing.** Selection and Use of Diamonds for Dressing Grinding Wheels, W. M. Robinson. Machy. (Lond.), vol. 23, no. 585, Dec. 13, 1923, pp. 321-324, 3 figs. Author explains general practice in handling this work, and presents original information on use of truing diamonds.

**Safety Code.** Safety Code for the Use, Care, and Protection of Abrasive Wheels. U. S. Bur. Labor Statistics, Bul. No. 338, Apr. 1923, 20 pp. Tentative American standard approved Feb. 11, 1922 by Am. Eng. Standards Committee. Rules and specifications necessary to insure safety in use of abrasive wheels operating at speeds in excess of 2000 surface feet per minute.

## AERONAUTICAL INSTRUMENTS

**Air-Speed Indicators.** Measurement of Air Speed in Aeroplanes, C. J. Stewart. J. of Sci. Instruments, vol. 1, no. 2, Nov. 1923, pp. 43-50, 7 figs. Discusses methods adopted to determine value of this speed while in air; principles governing air speed indicator design.

**Revolution Counter.** An Improved Revolution Counter, B. K. Johnson. Flight, vol. 15, no. 50, Dec. 13, 1923, p. 752, 3 figs. Describes optical instrument for observing behavior of objects revolving at high speed (such as airplane propellers) besides actually recording their speed of rotation.

## AERONAUTICS

**Progress.** Some Aspects of Aeronautical Progress, F. H. Sykes. Roy. Aeronautical Soc.—Jl., vol. 27, no. 156, Dec. 1923, pp. 606-617. Notes on design, research, experiment and operation.

## AIR PUMPS

**Edwards.** The Edwards Air Pump, C. L. Grabham. Commonwealth Engr., vol. 11, no. 3, Oct. 1, 1923, pp. 100-110, 1 fig. Describes pump used in steam-power installations for removing condensed steam and air from condenser and delivering water to hot well where it is handled by feed pumps; pump with 14-in. barrels, 12-in. stroke, single-acting, at 150 r.p.m. will handle 45,000 lb. steam per hour from a surface condenser.

## AIRPLANE ENGINES

**Cylinder Calculation.** Aero-Engine Cylinder Calculations. Practical Engr., vol. 68, no. 1920, Dec. 13, 1923, pp. 333-335, 6 figs. Deals with cooling of water-cooled and air-cooled cylinders; calculation of volume of combustion chamber, valves and ports, stress in cylinder walls, and stress in bolts securing cylinder foot to crankcase.

**Light.** Review of Foreign Engines for Light Planes. Aviation, vol. 15, no. 26, Dec. 24, 1923, pp. 766-769, 6 figs. Adaptation of motorcycle engines giving way to special horizontal and vertical types.

## AIRPLANE PROPELLERS

**Direct and Geared Drives.** Relative Efficiency of Direct and Geared Drive Propellers, W. S. Diehl. Nat. Advisory Committee for Aeronautics—Report, no. 178, 1923, 9 pp., 3 figs. Shows relative values of various direct and geared drives.

**Reed.** The Reed Duralumin Airscrew. Aeroplane, vol. 25, no. 21, Nov. 21, 1923, p. 510, 1 fig. Consists of a single plate of duralumin of a thickness of up to 1 1/2 in. cut or pressed out to developed blade plan, shaped to required blade sections, and then twisted to required pitch angles throughout its length.

## AIRPLANES

**Barling Bomber.** The Barling Bomber. Flight, vol. 15, no. 50, Dec. 13, 1923, pp. 749-751, 8 figs. Describes N. B. L.-1, a giant American triplane; six 400-hp. Liberty engines; span 120 ft., length 65 ft., chord 13 ft. 6 in., wing area 4180 sq. ft.

**Carley.** The Carley Light Plane. Flight, vol. 15, no. 48, Nov. 29, 1923, pp. 725-728, 7 figs. Monoplane; span 24 ft. 7 in., length 15 ft. 9 in., wing area 109 sq. ft.; 20-hp. Anzani engine.

**Commercial.** Two Recent American Commercial Planes. Flight, vol. 15, no. 52, Dec. 27, 1923, pp. 777-778, 5 figs. Particulars of Lincoln-Standard L. S. 5, a five-seater, fitted with 8-cylinder Hispano-Suiza engine developing 180 hp. at 1750 r.p.m.; and the Laird Limousine, or enclosed cabin-type tractor biplane, fitted with a 300-hp. 12-cylinder Packard engine.

**Dietrich-Gobiet.** The New Dietrich-Gobiet Biplane (Der neue Dietrich-Gobiet-Doppeldecker), C. Kreuter. Motorwagen, vol. 26, no. 32-33, Nov. 20-30, 1923, pp. 462-463, 4 figs. Details of new D. P. 2 model Bussard, a strutless plane with 50 or 75-hp. Siemens-Stern engine.

**Glider.** The Dresden Glider, Type 1923 (Das Segelflugzeug Type 1923 des "Dresdner Segelflugzeugbau"), G. Reinhard. Motorwagen, vol. 26, no. 31, Nov. 10, 1923, pp. 452-454, 2 figs. Construction details of one of competing planes of Rhön Competition, 1923.

**Guide Cables.** Leader Cable Systems for Steering of Aeroplanes. Flight, vol. 15, no. 52, Dec. 27, 1923, pp. 782-785, 9 figs. Brief explanation of principles involved and apparatus used in Loth guide cable. From paper by M. Loth read before Instn. Aeronautical Engrs.

**Light.** The English Light Plane Meeting and Its Lessons (Der englische Weltbewerb für Kleinflugzeuge und seine Lehren), G. Lachmann. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no. 23-24, Dec. 27, 1923, pp. 165-172, 11 figs. Describes airplanes and their engines, performances and conclusions therefrom.

**The Pegna "Rondine" Light Monoplane.** Flight, vol. 15, no. 52, Dec. 27, 1923, pp. 779-780, 2 figs. Designed for low speeds and high power loading; 400 cc. A. B. C. flat twin engine, developing 5.7 hp. at 3450 r.p.m.; span 32 ft. 10 in., length 19 ft. 7 in., wing area 215 sq. ft.

**Light, Use as Models.** Light Aeroplanes as Flying Scale Models of Large Machines. Flight, vol. 15, no. 51, Dec. 20, 1923, pp. 761-763, 3 figs. Describes de Montagne type 72 light monoplane built to represent a large three-engined commercial monoplane now under construction at works of French Pucaylet-de-Monge firm, as example of manner in which small flying model of a large machine can be used for collecting certain data; two 35-hp. Anzani engines; no fuselage.

**Low-Powered.** The Construction of Light Airplanes (Bemerkungen zum Klein-Flugzeugbau), W. v. Langsdorff. Motorwagen, vol. 26, no. 31, Nov. 10, 1923, pp. 450-452. Discusses influence of glider construction on development of light airplanes, and describes types of light planes.

**Oscillations in Steady Flight.** The Small Angular Oscillations of Airplanes in Steady Flight, F. H. Norton. Nat. Advisory Committee for Aeronautics—Report, no. 174, 1923, 8 pp., 5 figs. Investigation carried out to provide data concerning small angular oscillations of several types of airplanes in steady flight under various atmospheric conditions; of use in design of boom sights and other aircraft instruments.

**Rondine.** The Pegna "Rondine," G. Piccioli. Int. Aeronautics, vol. 1, no. 3, Sept. 1923, pp. 93-94, 2 figs. Brief description of new small Italian monoplane with unusually good performance; span 10 meters, wing width 2 m., shape of wing elliptical, length 6 m., height 1.3 m.

**Sport.** The Kinner "Airster" Sportplane. Flight, vol. 15, no. 49, Dec. 6, 1923, pp. 735-736, 3 figs. Designed and built by Kinner Airplane & Motor Corp., Glendale, Cal., with 60-hp. 3-cylinder, air-cooled "Kinner" engine, mounted in nose of fuselage.

**Struts.** Compressive Strength of Tapered Airplane Struts, Viktor Lewe. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 171, Dec. 1923, 8 pp., 1 fig. Methods for ascertaining value of  $\pi$  in Euler's simplified formula for compressive strength of tapered airplane struts, by estimating from curves and by calculation. Translated from Technische Berichte, vol. 3, no. 7.

**Wind-Tunnel Tests.** Tests on a Model of the D Airplane T 39 of the "Deutsche Flugzeug Werke" (German Airplane Works), W. Molthan. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 175, Jan. 1924, 23 pp., 7 figs. Results of experiments made in small wind tunnel of Göttingen laboratory. Translated from Technische Berichte, vol. 3, no. 7.

**Wing-Cutting Equipment.** The Nichols Wing Cutting Equipment, Jas. B. Ford. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 172, Dec. 1923, 6 pp., 5 figs. on supp. plates. Designed and built in order to meet long-felt necessity for means of producing metal wings for wind-tunnel tests which would be accurate and fair, and yet within price commensurate with value of model wing test.

**Wright Brothers.** Two Authoritative Accounts of the Wright Brother's Flying Experiments. Aviation, vol. 15, no. 25, Dec. 17, 1923, pp. 732-741, 6 figs. Contains following articles: The Wright Brothers' Aeroplane, Orville and Wilbur Wright (reprinted from Century Mag., Sept. 1908); and How We Made the First Flight, Orville Wright (reprinted from Flying, Dec. 1913).

## AIRSHIPS

**Rigid.** Z. R. I. The First American-Built Rigid Airship. Flight, vol. 15, no. 48, Nov. 29, 1923, pp. 721-723, 5 figs. Particulars of design and construction, and details of successfully accomplished trial flight.

## ALCOHOL

**Automobile Fuel.** The Carburetion of Alcohol, A. W. Scarratt. Sugar, vol. 25, no. 12, Dec. 1923, pp. 662-663. Factors necessary to successful use of alcohol in combustion engines.

## ALLOYS

**Aluminum.** See ALUMINUM ALLOYS.

**Gun Metal.** See GUN METAL.

**Zinc-Copper, X-Ray Analysis of.** X-Ray Analysis of Zinc-Copper Alloys, E. A. Owen and G. D. Presto. Physical Soc. Lond.—Proc., vol. 36, Pt. 1, Dec. 15, 1923, pp. 49-66, 5 figs. Account of results obtained in study of zinc-copper series.

## ALUMINUM

**Charges in.** Charges of Foreign Matter in Aluminum (Fremdstoffeinschlüsse im Aluminium), J. Czochralski. Zeit. für Metallkunde, vol. 15, no. 10, Oct. 1923, pp. 273-283, 33 figs. Oxide, carbide, phosphide and sulphide charges and charges of metallic sodium; metallographic characteristics; influences of

# Classified List of Mechanical Equipment

## Manufactured by Firms Represented in MECHANICAL ENGINEERING

FOR ALPHABETICAL LIST OF ADVERTISERS, SEE PAGE 156

- Accumulators, Hydraulic**  
 \* Farrel Foundry & Machine Co.  
 \* Mackintosh-Hemphill Co.  
 \* Worthington Pump & Machinery Corp'n
- Aftercoolers, Air**  
 \* Ingersoll-Rand Co.
- Air Compressors, Receivers, etc.**  
 (See Compressors, Receivers, etc., Air)
- Air Conditioning Apparatus**  
 \* American Blower Co.  
 \* Carrier Engineering Corp'n  
 \* Clamage Fan Co.  
 \* Sturtevant, B. F. Co.
- Air-Jet Lifts**  
 \* Schutte & Koerting Co.
- Air Washers**  
 \* American Blower Co.  
 \* Carrier Engineering Corp'n  
 \* Clamage Fan Co.  
 \* Cooling Tower Co. (Inc.)  
 \* Spray Engineering Co.  
 \* Sturtevant, B. F. Co.
- Alloys**  
 \* Driver-Harris Co.
- Alloys (Calite)**  
 \* Calorizing Co.
- Ammeters**  
 \* Bristol Co.  
 \* General Electric Co.  
 \* Westinghouse Electric & Mfg. Co.
- Anemometers**  
 \* Taylor Instrument Cos.  
 \* Weber, F. Co. (Inc.)
- Annealing**  
 \* American Metal Treatment Co.
- Arc Welding Equipment**  
 \* Westinghouse Electric & Mfg. Co.
- Arches, Boiler Furnace**  
 \* Liptak Fire-Brick Arch Co.  
 \* McLeod & Henry Co.  
 \* Titusville Iron Works Co.
- Arches, Fire Door**  
 \* McLeod & Henry Co.
- Arches, Ignition (Flat Suspended)**  
 \* Combustion Engineering Corp'n  
 \* Liptak Fire-Brick Arch Co.  
 \* McLeod & Henry Co.
- Asbestos Products**  
 \* Carey, Philip Co.  
 \* Garlock Packing Co.  
 \* Johns-Manville (Inc.)
- Autoclaves**  
 \* Farrel Foundry & Machine Co.
- Axles, Car**  
 \* Fuller-Lehigh Co.
- Babbitt Metal**  
 \* Medart Co.  
 \* Westinghouse Electric & Mfg. Co.
- Ball Bearings, Gages, etc.**  
 (See Bearings, Gages, Ball)
- Balls, Brass and Bronze**  
 \* Gwilliam Co.
- Balls, Steel**  
 \* Atlas Ball Co.  
 \* Gwilliam Co.  
 \* New Departure Mfg. Co.  
 \* S K F Industries (Inc.)
- Barometers**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Taylor Instrument Cos.
- Barometers, Mercurial**  
 \* Tagliabue, C. J. Mfg. Co.
- Bearings, Ball**  
 \* Fafnir Bearing Co.  
 \* Gurney Ball Bearing Co.  
 \* Gwilliam Co.  
 \* New Departure Mfg. Co.  
 \* Norma Co. of America  
 \* S K F Industries (Inc.)  
 \* U. S. Ball Bearing Mfg. Co.
- Bearings, Radial Thrust**  
 \* New Departure Mfg. Co.
- Bearing, Roller**  
 \* Gwilliam Co.  
 \* Hyatt Roller Bearing Co.  
 \* Norma Co. of America  
 \* Royersford Fdry. & Mach. Co.  
 \* Timken Roller Bearing Co.
- Bearings, Self-Oiling**  
 \* Brown, A. & F. Co.  
 \* Doehler Die-Casting Co.  
 \* Falls Clutch & Machinery Co.
- Bearings, Thrust**  
 \* Fafnir Bearing Co.  
 \* General Electric Co.  
 \* Gwilliam Co.  
 \* Norma Co. of America  
 \* S K F Industries (Inc.)  
 \* Timken Roller Bearing Co.  
 \* U. S. Ball Bearing Mfg. Co.
- Belt Dressing**  
 \* Dixon, Joseph Crucible Co.  
 \* Gandy Belting Co.
- Belt Lacing, Steel**  
 \* Bristol Co.
- Belt Tighteners**  
 \* Brown, A. & F. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Medart Co.  
 \* Smidth, F. L. & Co.  
 \* Wood's, T. B. Sons Co.
- Belting, Canvas (Stitched)**  
 \* Gandy Belting Co.  
 \* United States Rubber Co.
- Belting, Conveyor**  
 \* Gandy Belting Co.  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.
- Belting, Elevator**  
 \* Gandy Belting Co.  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.
- Belting, Endless**  
 \* Gandy Belting Co.
- Belting, Fabric**  
 \* Gandy Belting Co.
- Belting, Leather**  
 \* American Sole & Belting Leather Tanners (Inc.)
- Belting, Rubber**  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.
- Belting, Waterproof**  
 \* Gandy Belting Co.
- Bench, Work**  
 \* Manufacturing Equip. & Engrg. Co.
- Bending & Straightening Machines**  
 \* Long & Allstatter Co.
- Bends, Pipe**  
 \* Frick Co. (Inc.)  
 \* Vogt, Henry Machine Co.
- Billets, Steel**  
 \* Timken Roller Bearing Co.
- Bleaching Machinery**  
 \* Philadelphia Drying Machinery Co.
- Blocks, Tackle**  
 \* Clyde Iron Works Sales Co.  
 \* Roebbing's, John A. Sons Co.
- Blowers, Centrifugal**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Coppus Engineering Corp'n  
 \* De Laval Steam Turbine Co.  
 \* General Electric Co.  
 \* Ingersoll-Rand Co.  
 \* Kerr Turbine Co.  
 \* Sturtevant, B. F. Co.  
 \* Westinghouse Electric & Mfg. Co.
- Blowers, Fan**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Coppus Engineering Corp'n  
 \* Green Fuel Economizer Co.  
 \* Sturtevant, B. F. Co.
- Blowers, Forge**  
 \* Sturtevant, B. F. Co.
- Blowers, Pressure**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Lammert & Mann Co.  
 \* Sturtevant, B. F. Co.
- Blowers, Rotary**  
 \* Fletcher Works  
 \* Lammert & Mann Co.  
 \* Schutte & Koerting Co.  
 \* Sturtevant, B. F. Co.
- Blowers, Soot**  
 \* Diamond Power Specialty Corp'n  
 \* Sturtevant, B. F. Co.
- Blowers, Steam Jet**  
 \* Schutte & Koerting Co.
- Blowers, Turbine**  
 \* Coppus Engineering Corp'n  
 \* Sturtevant, B. F. Co.
- Blueing (Metal)**  
 \* American Metal Treatment Co.
- Boards, Drawing**  
 \* Dietzgen, Eugene Co.  
 \* Electro Sun Co. (Inc.)  
 \* Keuffel & Esser Co.  
 \* New York Blue Print Paper Co.  
 \* ParVell Laboratories  
 \* U. S. Blue Co.  
 \* Weber, F. Co. (Inc.)
- Boiler Baffles**  
 \* King Refractories Co. (Inc.)  
 \* McLeod & Henry Co.
- Boiler Compounds**  
 \* Dixon, Joseph Crucible Co.  
 \* Unisol Mfg. Co.
- Boiler Coverings, Furnaces, Tube Cleaners, etc.**  
 (See Coverings, Furnaces, Tube Cleaners, etc., Boiler)
- Boiler Fronts**  
 \* Brownell Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.
- Boiler Settings, Steel Cased**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* McLeod & Henry Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.
- Boilers, Heating**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Herbert Boiler Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.
- Boilers, Locomotive**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.
- Boilers, Marine (Scotch)**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Leffel, James & Co.  
 \* Titusville Iron Works Co.  
 \* Walsh & Weidner Boiler Co.
- Boilers, Marine (Water Tube)**  
 \* Babcock & Wilcox Co.  
 \* Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Casey-Hedges Co.  
 \* Connelly, D. Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Springfield Boiler Co.  
 \* Titusville Iron Works Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Ward, Charles Engineering Wks.
- Boilers, Portable**  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Frick Co. (Inc.)  
 \* Herbert Boiler Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.
- Boilers, Tubular (Horizontal Return)**  
 \* Bigelow Co.  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Cole, R. D. Mfg. Co.  
 \* Connelly, D. Boiler Co.  
 \* Erie City Iron Works  
 \* Herbert Boiler Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Vogt, Henry Machine Co.
- Boilers, Tubular (Vertical Fire)**  
 \* Bigelow Co.  
 \* Brownell Co.  
 \* Casey-Hedges Co.  
 \* Clyde Iron Works Sales Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.
- Boilers, Water Tube (Horizontal)**  
 \* Babcock & Wilcox Co.  
 \* Casey-Hedges Co.  
 \* Cole, R. D. Mfg. Co.  
 \* Connelly, D. Boiler Co.  
 \* Edge Moor Iron Co.  
 \* Erie City Iron Works  
 \* Herbert Boiler Co.  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Springfield Boiler Co.  
 \* Union Iron Works  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Wickes Boiler Co.
- Boilers, Water Tube (Inclined)**  
 \* Babcock & Wilcox Co.  
 \* Bigelow Co.  
 \* Casey-Hedges Co.  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Ward, Charles Engineering Wks.
- Boilers, Water Tube (Vertical)**  
 \* Babcock & Wilcox Co.  
 \* Bigelow Co.  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Wickes Boiler Co.
- Boxes, Carbonizing**  
 \* Driver-Harris Co.
- Boxes, Case Hardening**  
 \* Driver-Harris Co.
- Boxes, Water Service**  
 \* Murdoch Mfg. & Supply Co.
- Brake Blocks**  
 \* Johns-Manville (Inc.)
- Brakes, Air**  
 \* Allis-Chalmers Mfg. Co.  
 \* General Electric Co.
- Brass Goods**  
 \* Scovill Mfg. Co.
- Brass Mill Machinery**  
 \* Farrel Foundry & Machine Co.
- Breechings, Smoke**  
 \* Brownell Co.  
 \* Morrison Boiler Co.  
 \* Titusville Iron Works Co.  
 \* Vogt, Henry Machine Co.
- Brick, Fire**  
 \* Bernitz Furnace Appliance Co.  
 \* Celite Products Co.  
 \* Drake Non-Clinkering Furnace Block Co.  
 \* Keystone Refractories Co.  
 \* King Refractories Co. (Inc.)  
 \* McLeod & Henry Co.
- Brick Insulating**  
 \* Celite Products Co.  
 \* Quigley Furnace Specialties Co.
- Bridges, Coal & Ore Handling**  
 \* Brown Hoisting Machinery Co.  
 \* Link-Belt Co.
- Bridgewalls (Furnace)**  
 \* McLeod & Henry Co.
- Buckets, Elevator**  
 \* Brown Hoisting Machinery Co.  
 \* Chain Belt Co.  
 \* Gifford-Wood Co.  
 \* Hendrick Mfg. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

mechanical properties. Research work of committee for aluminum and light alloys of German Metallographical Soc.

#### ALUMINUM ALLOYS

**Analysis.** Contributions to the Quantitative Determination and Separation of Aluminum (Beiträge zur quantitativen Bestimmung und Trennung des Aluminiums), G. Jander and B. Weber. Zeit. für angewandte Chemie, vol. 36, no. 75, Dec. 3, 1923, pp. 586-590, 1 fig. Describes method of analysis for aluminum alloys by which it is possible to separate quantitatively the aluminum from the other alloy components.

#### AMMONIA

**Equilibrium.** The Ammonia Equilibrium, A. T. Larson and R. L. Dodge. Am. Chem. Soc.—Jl., vol. 45, no. 12, Dec. 1923, pp. 2918-2930, 3 figs. Computation of equilibrium values and constants, calculation of percentage of ammonia at equilibrium for temperature range of 200-1000 deg. and pressure range of 10-100 atmos.

#### ASH HANDLING

**Power Stations.** Ash Disposal, G. F. Zimmer. Electrician, vol. 91, no. 2380, Dec. 28, 1923, pp. 721-725, 5 figs. Details of appliances now used in power stations.

#### AUTOMOBILE ENGINES

**Air-Cooled.** The Future of the Air-Cooled Car, V. W. Pagé. Sci. Am., vol. 130, no. 1, Jan. 1924, pp. 22-23 and 71, 7 figs. Engineering and operating facts that call for its most serious consideration.

**Balance.** Balance of the Cadillac V-6 Engine, E. W. Seaholm. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 70-73, 5 figs. Points out that Gen. Motors Research Laboratories has investigated possibility of counteracting couples connected with this type of shaft and has arrived at solution through employment of compensating weights properly proportioned and disposed along crankshaft; this method of balancing had its first application in 8-cylinder engines built by Cadillac Motor Car Co.

**Design.** Petrol Engines, A. T. J. Kersey. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, 1923, pp. 493-506 and (discussion) 507-510, 8 figs. Discusses problems of design, including elimination of noise and vibration; freedom from breakdowns; accessibility for examination, adjustments and renewals; flexibility; economy in fuel consumption; reduction in weight and space occupied per hp.; and low cost of production.

**Despres Head.** Overhead Valves for Side-Valve Engines. Autocar, vol. 51, no. 1470, Dec. 21, 1923, pp. 1229-1230, 3 figs. Test of a French device, the Despres, designed to increase power of a standard 11.4-hp. Citroën car.

**Heavy-Oil.** The Bagnulo Engine (Der Bagnulo-Motor), Della Porta. Motorwagen, vol. 26, nos. 32-33 and 34, Nov. 20-30 and Dec. 10, 1923, pp. 460-461 and 481-483, 7 figs. Details of engine, developed by Italian engineer, which works only with heavy oil without addition of benzol or gasoline.

**Misuse and Efficient Application.** The Misuse of the Internal Combustion Engine, and Suggestions for Its More Efficient Application, L. Murphy. Automobile Engr., vol. 13, no. 184, Dec. 1923, pp. 409-415, 10 figs. Outlines limitations of variable-ratio method as means of economically transmitting output of gasoline engine to road wheels, and discusses possible alternatives.

**New York Show.** Distinct Progress Shown in Engine Design, A. Ludlow Clayden. Automotive Industries, vol. 50, no. 2, Jan. 10, 1924, pp. 61-64, 8 figs. Greater output per cu. in. of piston displacement secured; power plants are superior to those of year ago; larger bearing areas and lighter stresses have increased durability.

**Radiator Non-Freeze Solutions.** Non-Freeze Solutions for the Radiator. Motor Transport (N. Y.), vol. 29, no. 9, Dec. 1, 1923, pp. 304-305 and 308, 4 figs. Common difficulties with alcohol and glycerine solutions and suggested remedies; raising of boiling point of alcohol solutions important; pooling purchases proves economical.

#### AUTOMOBILE FUELS

**Alcohol.** See ALCOHOL.

**Crankcase-Oil Dilution.** Crankcase-Oil Dilution, E. P. Hallock. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 57-62. Presents tabular data to show how end points have risen since 1910, together with data showing effects of various percentages of fuel dilution with relation to Saybolt viscosities and pour points of high-grade oils; points out that contamination, not dilution, necessitates oil drainage; use of heavier-bodied oils decreed; how to avoid crankcase dilution, and oil sludging; proper oil specification.

**Heavy Oils.** Heavy Oils for Automobile Engines (Schwerölbetrieb bei Kraftwagen), Erwin Aders. Maschinenbau, vol. 2, no. 20, July 13, 1923, pp. G220-G224, 12 figs. Discusses difficulties in use of heavy oils and measures for combating them.

#### AUTOMOBILES

**All-Wheel Functioning.** All-wheel Functioning. Motor Transport (Lond.), vol. 37, no. 982, Dec. 24, 1923, pp. 823-824, 3 figs. Demonstration of possibilities of an experimental chassis having four wheels driven, braked, steered and independently sprung.

**Belgian Show.** Wide Range of Automotive Products Exhibited at Belgian Show, W. F. Bradley. Automotive Industries, vol. 49, no. 26, Dec. 27, 1923, pp. 1293-1295, 11 figs. Models not appearing at previous European exhibits include Imperia, with sleeve-valve engine and six-cylinder Austro-Daimler.

**Bodies.** Low Priced Closed Cars Increase in Number, H. Chase. Automotive Industries, vol. 50, no. 2, Jan. 10, 1924, pp. 72-77, 27 figs. Better-looking

radiators have improved frontal appearance and hood lines; sport models still popular.

**The "Weymann" Body-Construction.** Auto-Motor Jl., vol. 28, no. 50, Dec. 13, 1923, pp. 1099-1101, 5 figs. Analysis from coach-builder's and owner-driver's standpoints.

**Brakes.** Four-Wheel Brakes Are Most Striking Mechanical Feature of (New York) Show, P. M. Heldt. Automotive Industries, vol. 50, no. 2, Jan. 10, 1924, pp. 64-70, 25 figs. Standard equipment on 44 models and optional on 37; hydraulically operated systems strongly represented; new braking methods affect front axles; clutch improvements.

**Chrysler.** Chrysler Six Appears with Seven Bearing Crankshaft. Automotive Industries, vol. 49, no. 26, Dec. 27, 1923, pp. 1290-1292, 9 figs. Engine is L-head type; has piston displacement of 201 cu. in.; bore is 3 in. and stroke 4 1/4 in.; produced in Chalmers plant.

**Cubitt.** The 16 Hp. Cubitt Car. Auto-Motor Jl., vol. 28, no. 50, Dec. 13, 1923, pp. 1093-1096, 14 figs. British designed and manufactured car of great efficiency, roomy comfort, and low cost.

**Electric.** Storage-Battery-Driven Cars (La traction sur route par accumulateurs), Jean Boës. Revue Générale de l'Électricité, vol. 14, nos. 23 and 24, Dec. 8 and 15, 1923, pp. 905-916 and 967-988, 55 figs. Gives statistical data to show use of storage-battery cars, both for passengers and trucks, in all civilized parts of world; author deplors that this type of traction is practically unknown in France and points to America as country with widest use of such vehicles; gives number of comparative cost figures for gasoline-driven and electric cars, showing considerable saving for electric car. Bibliography.

**The Electric Battery Vehicle.** H. E. Dance. Instn. Elec. Engrs.—Jl., vol. 61, no. 323, Oct. 1923, pp. 1100-1108, 5 figs. Refers to early failure of electric-battery vehicle and to misconceptions which exist as to its proper duty; discusses question of transmission and control; information regarding methods of charging; includes table showing characteristics of two chief types of batteries.

**The New SB Electric One-Seater** (Der neue SB-Selbstfahrer), H. Salby. Motorwagen, vol. 26, no. 31, Nov. 10, 1923, pp. 446-449, 5 figs. Describes new type of electric car for city use which is made to sell for 600 gold mark, or about \$150; weight of car is 180 kg.; new features of SB engine.

**Electrical-Equipment Repairs.** The Engineer's Duty in Simplifying Electrical-Equipment Repairs, J. W. Tracy. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 11-12. Selection and application of apparatus is stated to be starting point in simplifying repairs to electrical equipment; notes on maintenance of repair-parts stock; dissemination of technical information and explicit service instructions for new apparatus.

**Equipment, German Show.** Automobile Equipment at the German Automobile Show 1923 (Auto-Zubehör auf der Deutschen Automobil-Ausstellung 1923), Hans-Georg Bock. Allgemeine Automobil-Zeitung, vol. 24, nos. 39, 40, 41, 42-43, 44 and 45-46, Oct. 2, 6, 11, 26, Nov. 6 and 16, 1923, pp. 37-38, 35-36, 25-26, 19-21, 21-23 and 18-21. Exhibits of ball bearings, tires, iron and steel parts, lamps, measuring instruments, coolers, piston rings, jacks and tools, wheels, vulcanizers and air pumps, etc.

**Fiat.** Care and Maintenance of the 10-15 Hp. Fiat-Autocar, vol. 51, nos. 1469 and 1470, Dec. 14 and 21, 1923, pp. 1169-1172 and 1233-1235, 13 figs. Dec. 14: Engine and its auxiliaries. Dec. 21: Transmission system and chassis details.

**German.** The Moll Automobile (Der Moll-Wagen). Motorwagen, vol. 26, nos. 31 and 32-33, Nov. 10 and 20-30, 1923, pp. 454-455 and 466-467, 2 figs. Details of 6/30-hp. 4-seater of medium size.

**Hupmobile.** The Hupmobile Car. Auto-Motor Jl., vol. 28, no. 51, Dec. 20, 1923, pp. 1115-1118, 10 figs. American car; roomy, comfortable bodywork, good springing and a sturdy powerful engine.

**Misase.** The 15 Hp. Misase Car. Auto-Motor Jl., vol. 28, no. 49, Dec. 6, 1923, pp. 1071-1074, 9 figs. Belgian car; has actual power of 35 hp.; four-cylinder engine.

**New York Show.** Interest Focuses on New Car Announcements. Automotive Industries, vol. 50, no. 2, Jan. 10, 1924, pp. 78-81, 3 figs. Details of new models shown for first time at New York Show; features of improvements.

**Packard.** Packard Adopts Four-Wheel Brakes on Single Six. Automotive Industries, vol. 49, no. 26, Dec. 27, 1923, pp. 1304-1305, 1 fig. External contracting type with half-wrap are used on back wheels and internal expanding shoes on front; equipment includes bar-type equalizers, located between front and rear operating systems.

**Parts.** Parts Manufacturers Exhibit New Products. Automotive Industries, vol. 50, no. 2, Jan. 10, 1924, pp. 81-84, 5 figs. Seven-speed gearset, taxicab engine, new drag-link design, oil purifier, car heater brake equalizer, and windshield cleaner are among new units presented at New York Show.

**Phoenix.** The 18 Hp. Phoenix Chassis. Automobile Engr., vol. 13, no. 184, Dec. 1923, pp. 386-392, 14 figs. Noticeable feature is wide employment of pressed-steel parts, generally of rather light gage; drive is taken from overhead-valve engine through metal-to-metal cone clutch to 3-speed gear box, final drive being by spiral bevel.

**Pierce-Arrow.** Pierce-Arrow Added to List of Cars Fitted with Front-Wheel Brakes. Automotive Industries, vol. 50, no. 1, Jan. 3, 1924, pp. 5-6, 2 figs. Adopts construction in which operating shafts are carried on axle center; reverse Elliott knuckle has vertical axis which meets ground more than 2 in. from central point of tire contact; provision against locking front wheels considered unnecessary.

**Racing.** Racing Cars (Renn-Wagentypen), K. C. Volkhart. Motorwagen, vol. 26, no. 32-33, Nov. 20-30, 1923, pp. 457-458, 5 figs. Discusses types participating in Avus Race.

**Repair Service.** How Engineers Can Cooperate to Make Flat-Rate Service a Success, J. Willard Lord. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 20-22. Points out need of cooperation of engineering and maintenance; development of special tools; reduction of parts expense; price of repair parts.

**Providing the Engineer with Service Data.** O. T. Kreusser. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 63-67 and 73, 2 figs. Tendencies of industry; maintenance troubles; field information; recording service data; cooperation between factory and service men.

**Standards.** Standards Committee Division Reports. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 37-56, 13 figs. Reports of Divisions on agricultural-power equipment, axle and wheels, frame, lubricants, non-ferrous metals, motorboats, passenger-car bodies, parts and fittings, storage batteries, screw threads, tires and rims.

**Stutz.** Stutz to Build Engine for New Model in Its Own Plant, J. Ed. Schipper. Automotive Industries, vol. 49, no. 26, Dec. 27, 1923, pp. 1296-1300, 3 figs. Speedway Six is larger than special announced last year; dimensions of cylinders are 3 1/4 by 5 in.; compression ratio is 4.45 to 1; balloon tires and 4-wheel brakes are optional equipment.

**Transmissions.** Variable Transmission, G. Constantinesco. Automobile Engr., vol. 13, no. 184, Dec. 1923, pp. 396-400, 8 figs. Critical consideration of problem.

#### AVIATION

**Air-Mail Service.** Annual Report on the U. S. Air Mail Service. Aviation, vol. 15, no. 26, Dec. 24, 1923, pp. 770-771, 1 fig. Mail planes flew 1,800,000 mi. with 67,800,000 letters making 96.72 per cent performance.

**Naval.** The United States Naval Air Service, 1922-23, Wm. A. Moffett. Aviation, vol. 16, no. 2, Jan. 14, 1923, pp. 34-37. Numerous new types of aircraft and engines developed for naval requirements. (Abstract.) Report of activities of U. S. Nav. Air Service during fiscal year ended June 30, 1923.

## B

#### BALANCING

**Problems.** Problems of Balancing (Auswuchtfragen), H. Hort. Maschinenbau, vol. 2, no. 25-26, Sept. 29, 1923, pp. G271-G277, 18 figs. Describes new static and dynamic balancing machines; practical aspects for balancing.

#### BEARING METALS

**Car Bearings.** Investigation of Bearing Metals for Railway Practice (Untersuchung über Lagermetalle für den Eisenbahnbetrieb), J. Karafiat. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereins, vol. 75, no. 33-35, Aug. 31, 1923, pp. 219-231, 2 figs. Investigation of bearing alloy consisting of tin, copper, antimony and lead.

#### BEARINGS

**Anti-Friction.** Journal Boxes with Anti-Friction Bearings, O. R. Wikander. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 33-35, 3 figs. Discusses possible standardization of ball and roller bearings for railway cars.

**Journal, Pad System Applied to.** The Pad System Applied to Journal Bearings, Johnstone-Taylor. Am. Mach., vol. 60, no. 1, Jan. 3, 1924, pp. 9-10, 4 figs. Design of bearings constructed on pad system and their advantages.

**Suspended.** Progress in Transmission Construction (Fortschritte im Transmissionsbau), F. Wilcke. Praktischer Maschinen-Konstrukteur, vol. 56, no. 36-37, Sept. 18, 1923, 4 pp., 8 figs. Describes latest type of Flender suspension bearings with ring lubrication, and Flender friction coupling, and points out their advantages.

#### BEARINGS, ROLLER

**Spherical.** The Solution of the Railway Bearing Problem through the SKF Spherical Roller Bearing (Die Lösung der Eisenbahnlagerfrage durch das SKF sphärische Rollenlager), F. Nussbaum. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereins, vol. 75, no. 33-35, Aug. 31, 1923, pp. 208-218, 16 figs. Notes on rolling resistance of railway cars; tests with spherical roller and other bearings; load capacity of ball and roller bearings; details of spherical rolling bearings and saving in coal effected by their use.

#### BELTING

**Leather.** How to Select, Install and Care for Leather Belting, C. O. Streeter. Belting, vol. 23, no. 6, Dec. 1923, pp. 39-42, 3 figs. Description of best methods of securing efficient power transmission through leather belting; principles of power transmission.

**Instructions for Making Leather Belts Endless.** L. W. Army. Nat. Engr., vol. 27, nos. 9 and 11, Sept. and Nov. 1923, pp. 413-416 and 543-546, 18 figs. Procedure in making joints in different kinds of belts; different kinds of cement and their application; tools required and how to use them; lubrication of belts.

#### BLAST FURNACES

**Linings.** Reducing Lining Disintegration. H. E. Townsend. Iron Trade Rev., vol. 75, no. 3, an. 17, 1924, pp. 232-234, 2 figs. After two linings high in

iron oxide had failed prematurely, a third lining low in iron oxide satisfactorily withstood disintegration on same furnace during 12-month campaign.

#### BOILER FEEDWATER

**Temperature, Increasing.** Effect of Increased Feed Water Temperature, J. R. Darnell. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 131-132. Boiler efficiency is not increased by raising feedwater temperature; effect is to give boiler less work to do.

#### BOILER FURNACES

**Air Preheaters for.** Air Preheaters in Factories (Der Luftheizer in der Warmwirtschaft des Fabrikbetriebes), L. Finckh. Wärme, vol. 46, no. 18, May 4, 1923, pp. 185-188, 3 figs. Increasing heat economy of factory through diverting flow of heat by means of air preheater; describes air preheater and its operation and gives results of official test.

**Arch Design.** Suspended Arches Gaining in Favor. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 38-41, 10 figs. Proper ignition and combustion demand careful consideration of arch design; construction details.

**Dampers.** The Venetian Blind Damper. Eng. & Boiler House Rev., vol. 37, no. 5, Dec. 1923, p. 156, 1 fig. Describes damper, designed to overcome defects of ordinary sliding damper, in form of a Venetian blind having a number of movable horizontal shutters which can be adjusted with ease to regulate draft within very fine limits.

**Design.** Furnace Construction. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 35-37, 4 figs. Notes on proportions, special baffling, arches and linings.

**Grates.** Rocking and Dumping Grates. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 44-47, 11 figs. Principles of operation with general description and details of makes.

**Lining.** Improvements in Furnace Lining Material. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 41-42, 2 figs. Methods used to reduce maintenance cost of linings.

**Oil Burners.** Burning Boiler Oil. Power, vol. 58, nos. 6, 8 and 10, Aug. 7, 21 and Sept. 4, 1923, pp. 209-211, 290-292 and 367-269, 24 figs. Aug. 7: Describes various types of burners. Aug. 21: Steam atomizers. Sept. 4: Mechanical burners.

**Furnace Design Important in Burning Oil.** Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 63-66, 11 figs. Furnace volume and amount of combustion air important factors; types of oil burners.

**Smoke Preventer.** An Automatic Smoke Preventing Apparatus. Power Engr., vol. 19, no. 214, Jan. 1924, pp. 27-28, 3 figs. Device for prevention of smoke from Lancashire and Cornish-type boilers.

**Turbines.** The Modern Turbine Furnace. Eng. & Boiler House Rev., vol. 37, nos. 5 and 6, Dec. 1923, and Jan. 1924, pp. 149-150 and 152 and 198-200, 8 figs. Scientific principles underlying design and working of most modern type of steam-jet furnace as represented by installation of Turbine Furnace Co., Ltd., London.

**Wood-Waste-Burning.** Furnaces for Burning Wood Refuse. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 68-70, 7 figs. Difficulties encountered in burning refuse from woodworking plants and principles governing furnace design.

#### BOILER OPERATION

**Draft Regulation.** Draft and Its Relation to Combustion, R. S. Hawley. Combustion, vol. 9, no. 6, Dec. 1923, pp. 456 and 462. Points out that amount of draft which given boiler should have is dependent upon conditions of load, overload, type of furnace, grate and boiler, and kind and nature of fuel used.

**Instruments for.** The Value of Instruments for High-Grade Boiler-Room Operation, H. H. Bates. Power, vol. 58, no. 25, Dec. 18, 1923, pp. 988-989. Discusses use of instruments, including summary of boiler conditions and their symptoms or characteristics as indicated by meters.

**Regulations for.** Regulations for the Operation of Boiler Plants (Betriebsvorschriften für Dampfkesselanlagen), H. Guilleaume. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 50, Dec. 15, 1923, pp. 1122-1126. Discusses regulations for care and attendance of boilers in operation.

#### BOILER PLANTS

**Boston Elevated Ry.** Plant of the Boston Elevated Railway Co. Combustion, vol. 9, no. 6, Dec. 1923, pp. 466-469, 5 figs. Details of two new Babcock & Wilson cross-drum boilers installed in South Boston plant, under which are installed two new Frederick super-station stokers of 13 retorts each.

**Improvements.** Improvements in Steam Practice as Accomplished at Lukens Steel Company, G. D. Spackman. Assn. Iron & Steel Elec. Engrs., vol. 5, no. 12, Dec. 1923, pp. 659-679 and (discussion) 679-693, 8 figs. Describes changes made and savings effected.

#### BOILERS

**Cracks.** Boiler-Plate Cracks and Means of Preventing Them (Blechschäden an Dampfkesseln und Mittel zu ihrer Verhütung), F. Loch. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 50, Dec. 15, 1923, pp. 1114-1116, 5 figs. Cause of crack formation in rivet seams of boilers; recommendations for testing of boiler plate; rivet tests and confirmation of correctness of maximum pressures in hydraulic riveting established by Bach and Baumann; improved vertical-tube boilers.

**Developments 1923.** Boilers and Boiler Auxiliaries. Power, vol. 59, no. 1, Jan. 1, 1924, pp. 6-9. Foreign designs for high pressure; use of electric boilers increasing; developments in radiant heat; large combustion space favored; economy of stage bleeding; new instruments.

**Equipment.** Boiler Equipment. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, includes following articles: Description of Standard Types of Water Columns, Steam Gages, Fusible Plugs, Safety Valves, Steam Outlet Valves and Blowoff Valves, pp. 73-76, 9 figs.; Types and Details of Safety Valves, pp. 76-79, 10 figs.; Steam Outlet and Blowoff Valves, pp. 79-85, 22 figs.

**Feeding.** The Ideal Boiler Feeding and Its Realization (Die ideale Kesselspeisung und ihre Verwirklichung), H. Schierenbeck. Archiv für Warmwirtschaft, vol. 4, no. 12, Dec. 1923, pp. 209-212, 9 figs. Disadvantages of usual methods; basic principles for automatic regulation of boiler feeding; advantages of regulator and field of application.

**Horizontal Return Tubular.** Horizontal Return Tubular Boilers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 19-21, 2 figs. Due to influence of standardization selection depends largely upon boiler-shop practice. See also article entitled, Setting the Horizontal Return Tubular Boiler, pp. 21-23, 4 figs.

**Ignition Arches in.** Ignition Arches in Flame Tube Boilers (Die Einwirkung von Zündgewölben in Flammrohrkesseln), M. Schimpf. Glückauf, vol. 59, no. 47, Nov. 24, 1923, pp. 1057-1059, 2 figs. Gives test data relating to a Lancashire-type boiler with 100.5-sq. m. heating surface and 3.23-sq. m. grate area; it was found that addition of three ignition arches reduced amount of smoke formed and increased efficiency of boiler by 6.4 per cent.

**Injuries to.** Boiler Damages (Kesselschäden), R. Baumann. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 50, Dec. 15, 1923, pp. 1109-1113, 21 figs. Discusses possible causes of boiler damage, with regard to materials, construction and operation, and taking into consideration too rapid development of boilers for continually increasing pressures (temperatures) and larger dimensions; problem of life of boiler.

**Inspection.** Inspection of Boiler Construction (Ausführung der Bauüberwachung), H. Bracht. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 50, Dec. 15, 1923, pp. 1120-1122. Rules for inspection.

**Locomotive.** See LOCOMOTIVE BOILERS.

**Marine.** See MARINE BOILERS.

**Mercury-Vapor.** Mercury Boiler in Successful Operation. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 136-138, 5 figs. Combination mercury and steam cycle shows remarkable savings at Hartford Elec. Light Co. plant.

**Parts, Strength of.** Strength of Boiler Parts. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 30-34, 6 figs. Strength of riveted joints; welded joints; heads and stays in boiler shells; boiler tubes; steam nozzles.

**Piping.** Boiler Piping Arrangements. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 86-88, 4 figs. Feedwater, blowoff, drip and drain safety valve and steam piping. See also article entitled, Safety First Should be Feature of Boiler Piping, pp. 88-89, 2 figs.

**Testing Codes.** The Need of an Efficient Boiler Testing Code, David Brownlie. Eng. & Boiler House Rev., vol. 37, no. 5, Dec. 1923, pp. 143-144 and 147. Deals with main points, both in criticism of existing codes and from point of view of suggestions for a new code.

**Vertical, Tubular.** Adaptability of Vertical Tubular Boilers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1923, pp. 24-26, 5 figs. Suited for installations where compactness and low first cost are of prime importance.

**Wadurf, Tests of.** Tests with the Wadurf Boiler (Versuche mit dem Wadurf-Kessel), P. Zwiauer. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 50, Dec. 15, 1923, pp. 1117-1119, 3 figs. Results of tests carried out on boiler of original design for long-distance heat transmission and smokeless firing.

**Waste-Heat.** Waste-Heat Boilers, C. H. Bamber. Gas World, vol. 79, no. 2056, Dec. 15, 1923, pp. 546-550 (includes discussion). Discusses validity of some of the claims made for these boilers; waste-heat versus solid fuel, or convection versus radiation; design; water-tube boiler for waste heat; fire-tube boiler; heat available from vertical retorts; chimney temperature and natural draft; etc. Paper read before Manchester and District Jr. Gas Assn.

**Water-Tube.** See BOILERS, WATER-TUBE.

#### BOILERS, WATER-TUBE

**Construction.** Water-tube Boilers, C. C. Pounder. Mech. World, vol. 74, nos. 1916, 1918, 1921, 1922 and 1930, Sept. 21, Oct. 5, 26, Dec. 7 and 28, 1923, pp. 178, 212-213, 360, 358-359, and 405, 16 figs. Characteristics and construction of different types.

**Hanomag.** High-Power Boilers (Hochleistungs-Dampfkessel), F. Wilcke. Praktischer Maschinen-Konstrukteur, vol. 56, no. 38-39, Oct. 2, 1923, 3 pp., 2 figs. Details of Hanomag vertical-tube boiler for pressures up to 35 atmos.; results of tests with lignite, briquette and anthracite firing.

**Standard American.** Details of Standard Water-Tube Boilers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 7-18, 36 figs. Descriptions and illustrations showing best practice of modern American design and construction.

#### BONUS SYSTEMS

**Practical Application.** Applying the Bonus System to Diversified Operations, Chas. E. Bassett. Indus. Management (N. Y.), vol. 67, no. 1, Jan. 1924, pp. 47-51, 5 figs. Practical wage-incentive plant.

#### BRAKES

**Air.** The Evolution of Air Brakes for Steam Road Service, G. Terwilliger. New England R. R. Club, Dec. 11, 1923, pp. 179-190 and (discussion) 190-207. History and principal operating advantages incident to the various stages of development.

#### BRASS

**Finishes.** Popular Surface Finishes for Brass.

Metal Industry (Lond.), vol. 23, no. 26, Dec. 28, 1923, pp. 577-578. Notes on "primrose," satin, oxidized silver, and iridescent finish.

#### BUSES

**Trolley.** Trolley Omnibus System in Wolverhampton (Eng.). Tramway & Ry. World, vol. 54, no. 30, Dec. 20, 1923, pp. 318-322, 15 figs. Advantages of adopting trolley omnibus system of traction on Wednesfield route; details of chassis of bus adopted, which was designed to carry load of 5 tons including car body.

## C

#### CALORIMETERS

**Throttling.** The Throttling Calorimeter, Thos. M. Gunn. Power, vol. 58, no. 26, Dec. 25, 1923, pp. 1023-1024, 2 figs. Simple explanation of how it works, how it is used, and how it is made.

#### CAR LIGHTING

**Efficient.** Railway Car Lighting, G. E. Hulse. Illuminating Eng. Soc.—Trans., vol. 18, no. 8, Oct. 1923, pp. 748-762. Limitations encountered in problem of supplying illumination to cars; means of lighting; standardization of car illumination; coach-lighting tests of 1913; arrangement of fixtures for various types of cars, and resulting illumination; types of glassware used and efficiency of installation with this glassware.

#### CAR WHEELS

**Chilled-Iron.** Making Car Wheels in Railroad Shops. Ry. J., vol. 29, no. 12, Dec. 1923, pp. 24-27, 6 figs. Describes work done in foundry of Norfolk & Western shops at Roanoke, Va., in making chilled cast-iron car wheels.

**Steel, Wrought.** Wrought Steel Wheels for Car and Tender Service, A. Knapp. Car Foremen's Assn. of Chicago—Proc., vol. 18, no. 3, Dec. 1923, pp. 19-22, 25-28 and (discussion) 28, 31-32, 35-36, 39-40 and 43-44. Outline of directions being prepared to issue to N. Y. Central Lines to assist car and motive-power departments to conform to recommendations of Am. Ry. Assn. referring to maintenance of wrought-steel wheel tread and flange contours; use of new wheel gage.

#### CARBON DIOXIDE

**Properties.** Properties of Carbon Dioxide, Chas. H. Hertz. Refrig. World, vol. 58, nos. 9 and 10, Sept. and Oct. 1923, pp. 13-16 and 36, and 13-15, 1 fig. Latest tables on CO<sub>2</sub>, and explanation thereof.

#### CARS, FREIGHT

**Logging, Steel-Frame.** 50-Ton Capacity Steel Frame Logging Car. Ry. Rev., vol. 73, no. 24, Dec. 15, 1923, pp. 853-854, 4 figs. Design for Trinity County Lumber Co. embodies original feature in arrangement of metal bunks and stakes.

**Mass Production.** Mass Production of Railway Wagons. Engineer, vol. 136, no. 3548, Dec. 28, 1923, pp. 697-700, 10 figs. Describes plant, methods and equipment at Derby works of Lond., Midland & Scottish Ry. See also Engineering, vol. 116, no. 3026, Dec. 28, 1923, pp. 797-891, 15 figs.

**Production Statistics, 1923.** Freight Car Increase Breaks All Records. Ry. Age, vol. 76, no. 1, Jan. 5, 1924, pp. 87-93, 1 fig. Railroads devoted 39 per cent of all 1923 capital expenditures to freight cars; gives table of orders in 1923 for service in United States.

#### CARS, PASSENGER

**Production Statistics, 1923.** Large Progress in Passenger Car Acquisitions. Ry. Age, vol. 76, no. 1, Jan. 5, 1924, pp. 83-86, 1 fig. Orders less than in 1922 but otherwise largest since 1916; production largest since 1917; gives table of orders in 1923 for service in United States.

**Sleepers.** New Canadian National Sleeping Cars. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 27-30, 5 figs. Also Ry. Age, vol. 76, no. 2, Jan. 12, 1924, pp. 189-190, 5 figs. Distinctive floor plan, arrangement; frame and exterior of steel; interior finished with wood.

#### CASE-HARDENING

**Localized.** Local Surface Hardening. English Mechanics, vol. 118, no. 3064, Dec. 14, 1923, p. 297, 4 figs. Makes reference to one or two existing practical methods of local case-hardening, and describes Vickers local hardening process.

**Methods and Applications.** Case-Hardening (Ueber Einsatzhärtung), H. Graefe. Maschinenbau, vol. 2, no. 23, Aug. 22, 1923, pp. B265-B274, 26 figs. Properties of charge; alloyed and unalloyed material; testing charge powder; packing; testing of inserted pieces; practical examples.

#### CAST IRON

**Mass Effect.** Cast Iron and Mass Effect, O. Smalley. Metal Industry (Lond.), vol. 23, nos. 24 and 25, Dec. 14 and 21, 1923, pp. 541-542 and 561-565, 10 figs. Discusses time factor for various sections of cast iron to solidify under known conditions; effect of chemical composition on solidity; penetrating power of gray cast iron; relation between chemical and structural changes as effected by time and temperature, adoption of some simple standard of solidity; effect of design on strength in normal castings; and rate of running to mass effect and its possibilities and limitations in application to manufacture of solid castings without risers. Abridgement of paper read before Int. Convention of Foundrymen in Paris.

**Physical Tests.** Physical Tests for Grey Iron, J. Shaw. Engineering, vol. 116, no. 3024, Dec. 14

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

1923, pp. 755-756, 2 figs. Discusses inadequacy of present-day analyses. Paper read before Sheffield Assn. of Metallurgists and Met. Chemists.

#### CASTING

**Centrifugal.** Centrifugal Casting Machines Now a Reality, A. W. Cowper. Can. Foundryman, vol. 14, no. 12, Dec. 1923, pp. 24 and 26. Deals with aspects of centrifugal casting process as applied to production of cast iron castings.

#### CASTINGS

**Large, Breaking up.** Breaking up Large Castings. Practical Engr., vol. 68, no. 1920, Dec. 13, 1923, pp. 328-329, 2 figs. Hints on use of explosives for breaking up large castings for scrap, for demolishing concrete foundations and other massive material. Abstracted from booklet issued by Nobel Industries.

#### CENTRAL STATIONS

**Desuperheater and Attenuator.** Desuperheater and Attenuator, H. W. Brooks. Power, vol. 58, no. 25, Dec. 18, 1923, pp. 992-993, 5 figs. Special feature of remodeled Batavia electric-railroad plant.

**Improvements.** Advances in Power Station Practice, E. M. Hollingsworth. Instn. Elec. Engrs.—Jl., vol. 62, no. 324, Dec. 1923, pp. 31-36. Survey of improvements in application of higher steam pressures and temperatures; more satisfactory treatment and heating of feedwater; increased speed of turbo-generators for given output; and stage reheating of steam. Chairman's address.

**Metropolitan Edison Co., Middletown, Pa.** Metropolitan Edison Company's Middletown Plant. Power, vol. 58, no. 26, Dec. 25, 1923, pp. 1026-1027, 2 figs. Plant laid out for 200,000-kw. capacity in six units; boiler to be fired with powdered coal.

**Oil-Engine Electric-Light.** An Efficient Oil Engine Light Plant, Ray C. Burrus. Power, vol. 58, no. 26, Dec. 25, 1923, pp. 1016-1020, 7 figs. Describes municipally owned electric-light plant at South River, N. J.

**Remodeling.** Remodeling Electric Railway Plant at Batavia, Illinois, H. W. Brooks. Power, vol. 58, no. 18, Oct. 30, 1923, pp. 678-682, 6 figs. Plant installed 22 years ago was modernized and all equipment put in such good operating conditions as to effect reduction in coal consumption of 20 per cent and maintenance costs by same ratio.

**Sites, Selection of.** The Best Site for a Power Station, Alex. Russell. Instn. Elec. Engrs.—Jl., vol. 62, no. 324, Dec. 1923, pp. 12-13, 1 fig. Points out that in considering best site for power station it is helpful to know position of site for which copper required for feeder mains would be a minimum; other factors which must be taken into account. Part of inaugural address.

**Waukegan, Ill.** New Waukegan Power Station. Power, vol. 59, no. 3, Jan. 15, 1924, pp. 80-86, 11 figs. First unit of 250,000-kw. base-load plant; boilers designed for 400 lb. and 700 deg.; a. c. stoker drive arranged for 40 speeds; coal-handling and feedwater systems; data on mechanical and electrical equipment. See also Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 119-126, 8 figs.

**Waukegan 400-Lb. Plant Operating.** Elec. World, vol. 83, no. 2, Jan. 12, 1924, pp. 78-86, 22 figs. High pressure a feature of new generating station on system of Public Service Co. of Northern Illinois; ultimate rating may be 250,000 kw. or more; mechanical and electrical features.

#### CHAIN DRIVE

**Sprockets.** Remedying Faults in Sprockets, John S. Watts. Machy. (N. Y.), vol. 30, no. 5, Jan. 1924, pp. 350-351, 2 figs. Effect of changing pitch of driver and of follower; advantages gained by change in pitch; improved sprocket design.

#### CHIMNEYS

**Calculation.** The Static Calculation of Steel Chimneys for Factories (Die statische Berechnung eiserner Fabriksschornsteine), P. Stephan. Praktischer Maschinen-Konstrukteur, vol. 56, nos. 32-33 and 34-35, Aug. 21 and Sept. 4, 1923, 2 and 4 pp., 9 figs. Gives two examples of numerical calculation.

#### CHROME STEEL

**Hardness.** Secondary Hardness in Austenitized High Chromium Steels, Edgar C. Bain. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 89-101 and (discussion) 101-105, 14 figs. Summary of hardness measurements made with Rockwell hardness tester on four grades of high-carbon, high-chrome steel with variety of quenches and series of draws; sample tools made from these steels in which secondary hardness had been developed after having been quenched austenitic gave results in cutting speed between that of carbon steel and high-speed steel.

#### COAL

**Purchasing and Inspection.** An Effective Method for Keeping Fuel Costs within Bounds, G. Milton Levy. Factory, vol. 32, no. 1, Jan. 1924, pp. 40-42, 2 figs. It has been found that by composing coal by shippers, it is possible to determine quality of coal shipped from various mines and when unsatisfactory, shipments from that mine can be cancelled; presents chart showing results of this inspection over period of year.

**Relative Steaming Values.** Value of Coke, Anthracite, and Bituminous Coal for Generating Steam in a Low-Pressure Cast-Iron Boiler, J. Blizard, J. Neil and F. C. Houghton. U. S. Bur. Mines, Technical Paper 303, 1922, 56 pp., 22 figs. Description of tests carried out, and results obtained, to determine relative steaming values of coke, anthracite, and bituminous coal when burned in a low-pressure boiler, and fired by hand in fairly large quantities at a time; to separate heat losses and examine them; to determine change in efficiency with method of firing fuel and manipulation of draft dampers, with rate of evaporation, and with various fuels burned; and to determine other factors affecting output of boiler.

ciency with method of firing fuel and manipulation of draft dampers, with rate of evaporation, and with various fuels burned; and to determine other factors affecting output of boiler.

#### COAL HANDLING

**Conveyors.** Coal-Conveyors, W. G. Burt. Min. Inst. Scotland—Trans., vol. 44, Part 4, Oct. 13, 1923, pp. 136-138 and (discussion) 138-142. Details of working costs and conditions of Blackett and shaker or jigger conveyors, which are of constant-delivery type, and of Thomson conveyor, which is of intermittent-delivery type.

**Loading Plants.** Modern Coal-Loading Plants (Neuzeitliche Kohlenverladeanlagen), G. Fiala. Maschinenbau, vol. 2, no. 24, Sept. 15, 1923, pp. G264-G267, 7 figs. Describes new type of automatic plant for boiler coaling with automatic unloading bucket, counterweight and electric control, and points out its advantages over older types.

**Piers.** Electrically Operated Coal Pier of Western Maryland Railway Co., Eng. World, vol. 23, no. 6, Dec. 1923, pp. 359-363, 8 figs. Construction data; operation of pier, including equipment.

**Steam-Generating Station.** Coal Handling at Zilwaukee, H. F. Eddy. Elec. World, vol. 82, no. 26, Dec. 29, 1923, pp. 1314-1316, 3 figs. Avoidance of great investment and costly attendance governed selection and arrangement of coal-handling equipment.

#### COAL STORAGE

**Advisability of.** Is Coal Storage Worth While? Power, vol. 59, no. 2, Jan. 8, 1924, pp. 42-44, 7 figs. Points out that regular systematic, large-scale storage of coal by consumers during seasons of low consumption is public's largest opportunity and responsibility in solving coal problem.

**Bituminous Coal.** The Storage of Bituminous Coal, W. L. Abbott. Indus. Management (Lond.), vol. 10, no. 11, Nov. 29, 1923, pp. 313-314. Notes on degradation of coal due to weather and handling, and means of preventing it. Author advises shutting down of superfluous coal mines.

**Economical Systems.** Some Methods of Storing Coal. Power, vol. 59, no. 3, Jan. 15, 1923, pp. 96-98, 6 figs. Discusses several low-priced systems of coal handling and storing.

#### COLD STORAGE

**Meat.** Large Meat Cold Storage at Bremerhaven Germany, M. Hirsch. Ice & Refrigeration, vol. 65, no. 6, Dec. 1923, pp. 358-361, 9 figs. Description of cold-storage building and equipment, material-handling system, and power plant; details of equipment in boiler house, engine room, and refrigerating plant; reliability and efficiency of plant.

#### COMBUSTION

**Products, Properties of.** Properties of the Products of Combustion, Rich. Brown. Combustion, vol. 9, no. 6, Dec. 1923, pp. 451-455, 5 figs. Presents charts for computation of temperature, excess air, B.t.u., weight, volume, and components of gas analysis.

#### COMPRESSED AIR

**Use in Speeding Production.** Compressed Air Speeds Superheater Production, F. A. Maclean. Can. Machy., vol. 30, no. 26, Dec. 27, 1923, pp. 132-133, 5 figs. Special applications of this medium in Montreal plant prove its value wherever an adaptable, cheap, and reliable form of power is required.

#### CONDENSERS, STEAM

**Defects.** Condenser Troubles, Mar. Engr. & Nav. Architect, vol. 47, no. 556, Jan. 1924, pp. 31-32, 4 figs. Consideration of defects common in condensers, and effect of application of metallic packing.

#### CORROSION

**Electrochemical Character.** The Electrochemical Character of Corrosion, Ulick R. Evans. Inst. Metals—advance paper, no. 7, for meeting Sept. 10-13, 1923, 44 pp., 4 figs. Prediction of electrochemical corrosion from potential measurements; experimental demonstration of electrochemical character of corrosion.

#### COST ACCOUNTING

**Capital Requirements and Control.** The Story Told by the Financial and Operating Statements, J. H. Bliss. Management & Administration, vol. 7, no. 1, Jan. 1924, pp. 25-30. Author takes typical financial statement and analyzes it so as to show wide range of essential information that can be drawn from its figures.

**Industrial.** Industrial Cost Accounting for Executives, Paul M. Atkins. Am. Mach., vol. 59, nos. 14 and 16, Oct. 4 and 18, 1923, pp. 513-517 and 591-594, 11 figs. Oct. 4: Recording product and improvement costs; checking distribution and summaries of items of cost. Oct. 18: Mechanical-labor-saving devices; reason for use of adding, calculating and tabulating machines, and schedule sheet.

#### CRANES

**Lifting.** Locomotive Lifting Cranes (Lokomotiv-Hebekrane), F. Scheuermann. Glaser Annalen, vol. 93, no. 10, Nov. 15, 1923, pp. 113-115, 9 figs. Design and construction of cranes constructed by Demag Duisburg, Germany.

**Runway.** A Reinforced-Concrete Crane Runway with Steel Traveling Crane (Eine Eisenbetonkranbahn mit Stahlkonstruktionslaufkran), C. Commentz. Beton u. Eisen, vol. 22, no. 16, Aug. 20, 1923, pp. 205-209, 12 figs. Describes crane runway built for material-storage section of shipyard in Hamburg, for unloading of ship plates and sections from railway cars and ships, and loading on cars of shipyard railway.

#### CUPOLAS

**Charging.** The Foundry Cupola and Mechanical Charging, A. A. Leardet. Foundry Trade Jl., vol.

28, no. 384, Dec. 27, 1923, pp. 539-543, 11 figs. Chemical action which takes place in cupola under blast; early forms of cupolas; steam jet cupolas; receivers; coke consumption; blast and tuyeres; blowing apparatus; hot-blast cupolas.

#### CUTTING TOOLS

**Overhang as Affecting Shop Costs.** How the Overhang of Tools Affects Shop Costs, Chas. F. Henry. Am. Mach., vol. 60, no. 1, Jan. 3, 1924, pp. 17-19, 9 figs. Examples from modern railway shops that can apply elsewhere as well; preventing vibration lengthens life of tools.

## D

#### DIE CASTING

**Electrical Parts.** Die-Casting of Electrical Parts, Wm. C. Hirsch. Elec. Rec., vol. 34, no. 6, Dec. 1923, pp. 354-356, 2 figs. Discusses special interest which electrical industry has in die-cast parts; die-casting limitations; improvements.

#### DIES

**Progressive.** Progressive Dies for Piercing, Bending and Blanking, I. Bernard Black. Machy. (N. Y.), vol. 30, no. 5, Jan. 1924, pp. 371-372, 5 figs. partly on p. 373. Describes "follow" and "progressive" die employed to produce locating bracket used in electrical device.

#### DIESEL ENGINES

**Fuel Valve.** A New Solid Injection Fuel Valve. Practical Engr., vol. 67, no. 1875, Feb. 1, 1923, p. 63, 1 fig. New type of fuel valve invented by A. F. Van Amstel of Holland.

**Generator Drive.** Oil-Engine-Driven Ship Generators in the German Navy (Der ölmotorische Antrieb von Borddynamos in der deutschen Kriegsmarine), W. Laudahn. Schiffbau, vol. 24, nos. 33-34, 35, 36-37, 38, 40-41, 42 and 46, May 16-23, 30, June 6-13, 20, July 4-11, 18 and Aug. 15, 1923, pp. 525-535, 549-554, 567-571, 593-599, 633-639, 659-664 and 719-725, 58 figs. Notes, including official data, on development of high-speed Diesel engines for dynamo drive. May 16-23: Engine with 40- and 60-kw. output; engine of Benz & Co. for mine cruiser, Bremse, May 30 and June 6: Daimler engine for small cruiser, Nürnberg, June 20: Vulcan works engine for small cruiser, Wiesbaden. July 4: Körting engine for small cruiser, Emden. July 18: Engine of Linke-Hofmann Works, Breslau, for small cruiser, Köln, Aug. 15: Sulzer Bros. engine for mine cruiser, Brummer.

**Hydroelectric Plants.** Put the Diesel Engine in the Hydro-Electric Business, A. Bacchi. Oil Engine Power, vol. 1, no. 12, Dec. 1923, pp. 574-581, 5 figs. Study of use of Diesel engines in hydroelectric undertakings.

**McIntosh & Seymour.** An American Built Diesel Engine, Peter Bain. Am. Shipp., vol. 17, no. 12, Dec. 1923, pp. 42-47, 8 figs. Details of 2250-hp. engine of vertical, single-acting, 4-cycle, crosshead type, being built at Auburn plant of McIntosh & Seymour Corp.

**Repairing.** Overhauling a Diesel Engine, M. S. Howard. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 139-141, 7 figs. Where to look for wear and how to handle repair work.

#### DRILLING MACHINES

**Development.** Fifty Years Development in Drilling Machines, Machy. (N. Y.), vol. 30, no. 5, Jan. 1924, pp. 352-354, 2 figs. Comparison between early and present-day designs of upright and radial drilling machines.

**Fifty Years of Drilling Machine Specialization.** Am. Mach., vol. 60, no. 1, Jan. 3, 1924, pp. 21-23. Drilling-machine history of past half century of Cincinnati Bickford Tool Co.; contrast between machines and performances of former years and today. See also Iron Age, vol. 113, no. 1, Jan. 3, 1924, pp. 61-65.

## E

#### EDUCATION, ENGINEERING

**Relation to Industry.** The Engineer as a Leader in Industry, O. S. Lyford. Eng. Education, vol. 14, no. 4, Dec. 1923, pp. 156-183, 4 figs. Shows inter-relationship between engineering schools and industries and need for cooperation of the two organizations interested in development and successful functioning of leadership in industry; survey of situation; suggests groundwork for an educational-industrial structure.

#### ELASTICITY

**Theory.** Contributions to the Theory of Elasticity (Beiträge zur ebenen Elastizitätstheorie), Karl Wolf. Zeit. für technische Physik, vol. 4, no. 10, 1923, pp. 375-379, 5 figs. Notes on stress distribution in an arch.

#### ELECTRIC FURNACES

**Ferrovanadium Manufacture.** Manufacture of Ferro-Vanadium by Electric Furnace, E. Kilburn Scott. Engineer, vol. 136, no. 3546, Dec. 14, 1923, pp. 636-637, 6 figs. Describes electric furnace installed by Vanadium Corp. of America in Peruvian mine.

**Salt-Bath.** The Electric Salt-Bath Furnace in Workshop Practice (Der elektrische Salzbadofen im Werkstättenbetriebe), K. Hilde. Werkstattstechnik,

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

vol. 17, no. 22, Nov. 15, 1923, pp. 625-632, 10 figs. Principle of furnace; use of melted salt for electric heat resistance and at same time for heat conduction and storage; advantages of electric salt-bath furnace; design and operation; advantages of two new processes; regulation and measurement of bath temperature.

#### ELECTRIC LOCOMOTIVES

**Mexican Railway.** Ten Locomotives Being Built for Mexican Railway, C. H. Walker. Ry. Elec. Engr., vol. 14, no. 12, Dec. 1923, pp. 403-406, 3 figs. Details of 150-ton 3000-volt d. c. electric locomotives for initial electrification of Mexican Ry. Co.; one type motive-power unit will be used for both passenger and freight service.

**Speed Tests.** Speed Tests of New Electric Locomotives. Ry. Rev., vol. 73, no. 23, Dec. 8, 1923, pp. 816-820, 2 figs. Experimental runs on track equipped with recording instruments determines riding qualities at high speed.

#### ELECTRIC RAILWAYS

**Current-Flow Values, Determination.** A New Method of Determining Correct Value of Current Flow for Electric Railway Distribution Systems, C. E. Schutt. Elec. Traction, vol. 19, nos. 8, 10 and 11, Aug., Oct. and Nov. 1923, pp. 422-425, 568-570 and 607-611, 12 figs. Describes new method which enables operator to be sure of results without building of models; describes fundamental solution of a simple loop; the method as applied to specific problems of Kansas City Rys.; application to street-railway return circuit.

**Italy.** Electric Railways in Italy. Elec. Rev., vol. 93, no. 2405, Dec. 28, 1923, pp. 964-967, 2 figs. Power production; 3-phase traction; transformer stations and contact lines; electric locomotives; Turin-Modane line; electricity vs. steam.

**Rome-Ostia Electric Railway.** Elec. Ry. & Tramway J., vol. 49, no. 1215, Dec. 14, 1923, pp. 323-324, 4 figs. D. c. at 2400 volts; length 24.8 km.; notes on substation, contact, line, rolling stock, locomotives, and motor cars.

**Technical Problems.** Electric Traction, Geo. Gibbs. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 259, Sept. 1923, 86 pp., 35 figs. Electric traction on lines with much traffic; production and transmission of energy; type of current; locomotives and motor cars; electric systems used; installation and operating costs; some factors controlling selection of system; synopsis of important installations. Report made to Int. Ry. Assn., Ninth Congress, Rome, Italy, 1922.

#### ELECTRIC WELDING

**Railway Shops.** Electric Welding in Railway Shops, Juan St. Cere. Ry. J., vol. 29, no. 12, Dec. 1923, pp. 30-31. Shows what has been accomplished with electric-welding process in plant of N. Y. C.'s Depew shops.

#### ELECTRIC WELDING, ARC

**Fluxes.** Fluxes and Their Functions in Electric Arc Welding, J. Caldwell. Am. Welding Soc.—J., vol. 2, no. 12, Dec. 1923, pp. 27-31 and (discussion by C. J. Holslag) 31-32. Character of a weld; fluxes in steel manufacture; fluxes and their functions in arc welding; flux-covered electrodes for arc welding.

**Rail Bonds.** Arc Welded Rail Bonds, C. F. Gailor. Am. Welding Soc.—J., vol. 2, no. 12, Dec. 1923, pp. 7-17, 10 figs. History; character of bonds; use of molds; carbon arc welding; metallic arc welding; process in applying bonds to head of rail; procedure in applying base bonds; tests.

#### ELEVATORS

**Variable-Voltage Control.** Variable Voltage Control Systems as Applied to Electric Elevators, E. M. Bouton. Am. Inst. Elec. Engrs.—J., vol. 43, no. 1, Jan. 1924, pp. 52-63, 16 figs. Conclusions in favor of variable-voltage over rheostatic-control system, with regard to speed, acceleration and retardation, speed control and regulation, efficiency and economy of power consumption, maintenance, and safety.

#### EMPLOYMENT MANAGEMENT

**Employees' Magazine.** The Employees Magazine—Its Duties and Opportunities, Nat. Safety News, vol. 8, no. 6, Dec. 1923, pp. 39-45, 3 figs. A symposium of ideas on editorial methods and policies in connection with publication of employees' magazine intended to be a vital force for safety in plant.

**Rating Shop Employees.** A Practical System for Rating Shop Employees, A. H. Rodrick. Factory, vol. 32, no. 1, Jan. 1924, p. 32, 1 fig. Describes system of marking efficiency of shop employees used in shops of Naval Torpedo Station.

#### EVAPORATION

**Compression vs. Multiple-Effect.** Compression Evaporation (Ueber Kompressionsverdampfung), W. Genseke. Wärme, vol. 46, no. 12, Mar. 23, 1923, pp. 123-126, 5 figs. It is shown that compression evaporation is by no means superior to multiple-effect arrangement; introduction of heat pump is of value when a given temperature must be maintained in evaporation process; turbo and radiation compressors are particularly adapted to drive.

**Multiple-Effect.** Fundamental Principles of Multiple Effect Evaporation, Hugh K. Moore. Chem. & Met. Eng., vol. 29, nos. 26 and 27, Dec. 24 and 31, 1923, pp. 1144-1147, 2 figs., and 1190-1192, 8 figs. Dec. 24: Effects on evaporator designs and operation of heat conductivity, temperature levels and temperature differences. Dec. 31: Analysis of relation of heat conductivity to temperature differences in evaporating waste sulphite liquor.

#### EVAPORATORS

**Refrigerating Plants.** Evaporating Systems for Refrigerating Plant, Wm. F. Davis. Power, vol. 58, no. 26, Dec. 25, 1923, pp. 1028-1029. Discusses details

of evaporator design; evaporators in several units; purifying refrigerant; testing for water in system. Paper read before Nat. Assn. Practical Refrig. Engrs.

#### EYEBOLTS

**Standards for.** Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 3, no. 1, Oct. 11, 1923, pp. N1-N4, 4 figs. Proposed standards for eyebolts and nuts.

## F

#### FANS

**Electric Drive for.** Electric Drive for Centrifugal and Propeller Fans, Gordon Fox. Coal Industry, vol. 6, no. 12, Dec. 1923, pp. 503-507, 3 figs. Characteristics of fans operated at various percentages of rating with curves showing pressures, velocity heads, horsepower required and efficiencies.

#### FERROALLOYS

**Developments 1923.** Ferroalloy Developments in the Past Year, Rob. J. Anderson. Iron Age, vol. 113, no. 1, Jan. 3, 1924, pp. 94-97. Market conditions and results of metallurgical research; growing field of special alloys.

#### FIREBRICK

**Malleable-Iron Furnace Bungs.** The Behavior of Fire Brick in Malleable-Iron Furnace Bungs, H. G. Schurecht and H. W. Douda. Am. Ceramic Soc.—J., vol. 6, no. 12, Dec. 1923, pp. 1232-1241, 7 figs. Investigation conducted to study requirements of fire-clay and bodies used for firebrick in malleable-iron furnace bungs; describes tests made on complete bungs holding 40 sample brick in malleable-iron furnace bungs with 20 different firebrick, and results obtained.

#### FLIGHT

**Gliding.** Gliding Flight. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no. 17-22, Nov. 21, 1923, pp. 147-160. Includes following articles: Gliding Flight in Germany in the Past Year and Its Future Aims (Der deutsche Segelflug im vergangenen Sportjahre und seine künftigen Ziele), A. Baumker, pp. 147-150; Has Gliding Flight a Future? (Hat der Segelflug eine Zukunft?), A. Prohl, pp. 150-151; The Promotion of Gliding Flight (Betrachtungen zur Förderung des Segelflugs), Wilh. Hoff, pp. 151-152; The Mechanics of Gliding Flight (Zur Mechanik des Segelflugs), E. Everling, pp. 152-154; The Rhön Competition 1923 (Bemerkungen über Rhön-Wettbewerb 1923), W. Schlink, pp. 154-157, 1 fig.; The Rope Starting of Motorless Airplanes and Anchored Flight (Seilstart motorloser Flugzeuge und Fesselflug), E. Offermann, pp. 157-159, 6 figs., etc.

**The Rhön Gliding Flight Competition 1923 in Its Technical Evaluation (Der Rhön-Segelfluggewettbewerb 1923 in seiner technischen Auswertung), R. Eisenlohr.** Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no. 17-22, Nov. 21, 1923, pp. 136-145 and (discussion) 145-147, 25 figs. Description of participating planes and account of performances.

**The Valuation of Gliding Flight (Wertung von Segelflügen), E. Everling.** Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 14, no. 17-22, Nov. 21, 1923, pp. 135-136. Discusses aims and purposes of gliding flight.

**Horizontal Curvilinear.** Airplanes in Horizontal Curvilinear Flight, H. Kann. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 174, Jan. 1924, 25 pp., 12 figs. Gives simple method of calculation, and indicates method for determining area of aileron and rudder surfaces. Translated from Technische Berichte, vol. 3, no. 7.

**Inverted.** The Manœuvres of Inverted Flight, R. M. Hill. Roy. Aeronautical Soc.—J., vol. 27, no. 156, Dec. 1923, pp. 569-602 and (discussion) 602-605, 11 figs. Definition of inverted flight; reasons for investigation; nature of experiment; methods of attaining inverted position; effect of controls in inverted flight; resuming normal flight; the slow roll; the inverted spin; possibilities of inverted loop; conclusions.

**Soaring.** The "Mystery" of Soaring Flight, W. H. Sayers. Aeroplane, vol. 25, nos. 20 and 21, Nov. 14 and 21, 1923, pp. 488 and 508. Discusses results of observations made by E. H. Hainkin, and especially his paper read before Instn. Aeronautical Engrs., Nov. 9, dealing with noise and color changes, descending current theory, dust, contour and convection currents, gulls and steamers, turbulence, etc.

**Wind Energy and the Aeroplane.** Aeroplane, vol. 25, no. 25, Dec. 19, 1923, p. 588. Energy of gusts; meaning of indicated air speed; effect of rapid wind variations; alternating vertical winds; possibilities of using wind energy for flight.

#### FLOW OF FLUIDS

**Rough Pipes.** Flow Resistance in Rough Pipes (Strömungswiderstand in rauhen Röhren), K. Fromm. Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 5, Oct. 1923, pp. 339-358, 30 figs. Results of tests to investigate influence of roughness of pipe wall on pressure head in connection with flow of liquids through rough pipes.

**The Measurement of Hydraulic Roughness (Die Messung der hydraulischen Rauigkeit), L. Hopf.** Zeit. für angewandte Mathematik u. Mechanik, vol. 3, no. 5, Oct. 1923, pp. 329-339, 6 figs. Account and results of tests; discusses two kinds of roughness; notes on empirical formulas of hydraulics.

#### FLOW OF STEAM

**Measurement.** The Measurement of Steam Through Orifices (Die Messung des Wasserdampfes

durch Blenden), R. Geipert. Zeit. für angewandte Chemie, vol. 36, no. 66, Oct. 3, 1923, pp. 492-494, 5 figs. Describes method for measuring volume of flowing steam which is said to be accurate, simple and almost free of cost.

#### FLOW OF WATER

**Discharge Coefficients.** Determining Discharge Coefficients for Flow of Water in Short Pipes, O. W. Boston. Chem. & Met. Eng., vol. 30, no. 2, Jan. 14, 1924, pp. 56-59, 5 figs. Short method for determining loss of head for water flowing in pipes which may be readily applied in other cases of fluid flow.

**Pipes.** Velocity of Flow in Pipes, Eric Crewdson. Engineer, vol. 136, no. 3546, Dec. 14, 1923, pp. 635-636, 1 fig. Results of salt-method readings.

#### FLUE-GAS ANALYSIS

**Testing Apparatus.** Testing Flue Gases (En ny rökgasprovare), Folke K. G. Odqvist. Teknisk Tidskrift (Allmänna Avdelningen), vol. 53, no. 46, Nov. 17, 1923, pp. 357-358, 2 figs. Describes new flue-gas tester made by German concern, fundamental principle of which is based on difference in transmission of heat by different gases.

#### FORGINGS

**Design.** The Economical Construction of Forgings (Wie muss der Konstrukteur konstruieren, um eine wirtschaftliche Herstellung von Schmiedestücken zu erzielen?), M. Rinno. Maschinenbau, vol. 2, no. 24, Sept. 15, 1923, pp. G260-G262, 29 figs. Shows correct and incorrect designs and gives directions which should be followed in design of forge pieces for different forging processes.

#### FOUNDRIES

**Cast-Iron Borings and Turnings Utilization.** The Briquetting and Use of Cast-Iron Borings and Turnings, J. Alex. Gardner. Foundry Trade J., vol. 28, no. 382, Dec. 13, 1923, pp. 501-505, 10 figs. Early attempts; results of melting experiments; production data; drying process; results of mechanical tests; blast control.

**Molding-Machine Practice.** A Discussion on Pressure-Moulding Machine Practice. Foundry Trade J., vol. 28, no. 382, Dec. 13, 1923, pp. 511-513. Discussion following paper read by A. S. Beech on "Continental Foundry Practice." Deals with venting casserole molds, pattern plate making, venting and pressing, British and Continental sand, factors in speed of working, railway chair making, etc.

**Safety Code.** Safety Code for the Protection of Industrial Workers in Foundries. U. S. Bur. Labor Statistics, Bul. No. 336, Apr. 1923, 12 pp. Tentative American standard approved June 1922 by Am. Eng. Standards Committee, dealing with plant layout, machines and equipment, lighting, heating and ventilation, operating rules, and safety and welfare.

**Transport in.** Foundry Transport (Das Giesserei-Transportwesen), K. Zapf. Maschinenbau, vol. 3, no. 1, Oct. 11, 1923, pp. B1-B7, 8 figs. Delivery of raw materials and fuels to storage places; charging of cupolas; transport of liquid iron to foundry, and of molding material to sand-dressing machines; transport of patterns from storage room to foundry; transport of slag; etc.

#### FOUNDRY EQUIPMENT

**Pneumatic Tools.** Growing Importance of Compressed Air in the Foundry, R. C. Skerrett. Compressed Air Mag., vol. 28, no. 12, Dec. 1923, pp. 703-710, 30 figs. How compressed air and pneumatic tools make it possible for skilled man to do more work without overtaxing himself and unskilled man much good work which he could not do without these up-to-date aids.

#### FREIGHT HANDLING

**Container System.** Demountable Containers Expedite Freight Handling in Michigan, E. J. Burdick. Elec. Ry. J., vol. 62, no. 26, Dec. 29, 1923, pp. 1077-1079, 6 figs. Describes method adopted by Detroit United Ry. for handling freight in less-than-carload lots to facilitate loading and allow through routing of shipment without rehandling; consists of use of containers that can be loaded and sealed at point of origin and carried on special chassis to point where containers are loaded on special flat car of railway; mechanics of containers.

#### FUELS

**Coal.** See COAL; PULVERIZED COAL.

**Cost Determination.** Plotting Relative Cost of Various Fuels, R. I. Wynne-Roberts. Can. Engr., vol. 45, no. 25, Dec. 18, 1923, pp. 589-592, 3 figs. Graphic charts showing relation between different fuels as to relative cost for same service; method of deriving and preparing graphs, and how to apply them in practice.

**Oil.** See OIL FUEL.

**Pulverized Coal.** See PULVERIZED COAL.

**Refuse.** Modern Viewpoints for the Construction of Refuse Power Plants, H. Marcard. Eng. Progress, vol. 4, no. 11, Nov. 1923, pp. 237-240, 5 figs. Discusses development in Germany, and processes and plants for burning refuse of low heating value.

**Relative Economy.** The Fuel of the Future—What Shall It Be? I. Ginsberg. Am. Gas J., vol. 118, no. 26, and vol. 119, nos. 10, 13, 20, 24 and 27, June 30, Sept. 8, 29, Oct. 20, Nov. 17 and Dec. 8, 1923, pp. 557-561; 193-196 and 204-205; 253-257 and 264; 437-461; 545-547 and 556-558; and 609-611 and 621-623, 3 figs. Classification of fuels and discussion of properties of each and supplies in United States, to determine best fuel for universal usage; properties of a universal fuel; analysis of losses that occur in combustion of fuel; comparison of combustion efficiency of gas, coke and coal; definition of units; shows that gas is most economical fuel from standpoint of utilization of its inherent fuel value.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**FURNACES, INDUSTRIAL**

**Recuperators.** Recuperation—A New Design, E. R. Posnack. *Fuels & Furnaces*, vol. 1, no. 8, Dec. 1923, pp. 643-645, 3 figs. Describes recuperator designed by author, composed of an arrangement of standardized units so as to be flexible and adaptable to any size of installation; is of hollow tile and can be assembled to form independent air and gas flues.

**FURNACES, FORGING**

**Low-Grade Fuel.** Forging Furnaces (Der Schmiedefen), J. Pitscheder. *Werkstattstechnik*, vol. 17, no. 22, Nov. 15, 1923, pp. 637-640, 5 figs. Requirements of furnace for economical consumption of fuel and for use of low-grade fuel; describes type of furnace which is said to meet all these demands.

**G****GAS ENGINES**

**Preignition.** Pre-Ignition in Gas Engine. *Practical Engr.*, vol. 68, no. 1921, Dec. 20, 1923, pp. 339-340, 3 figs. Some troubles and worries met with in electrical power-house, Napier, New Zealand, and manner in which they were overcome.

**Silencing.** Silencing Gas Engines, A. Rutherford. *Practical Engr.*, vol. 68, no. 1919, Dec. 6, 1923, pp. 312-313, 4 figs. Divides method for silencing gas engines into two classes, namely, those which employ means whereby gas is expanded, or cooled, and those which aim at maintaining constant flow of gas at any reasonable velocity.

**Waste-Heat Utilization.** Tests on a Gas-Engine-Driven Generator Set with Waste-Heat Utilization (Betriebsversuche an einer Gasdynamomaschine mit Abhitzeverwertung), M. Steffes. *Archiv für Wärmewirtschaft*, vol. 4, no. 12, Dec. 1923, pp. 213-217, 16 figs. Gas consumption and steam production for the effective kilowatt-hour; heat balance of gas engine and waste-heat boiler; air of combustion and consumption of cooling water under different engine loads.

**GAS PRODUCERS**

**Ash-Fusion.** The Ash-Fusion Type of Gas Producer, M. Servais. *Gas & Oil Power*, vol. 19, no. 219, Dec. 6, 1923, pp. 39-40. Account of efficiencies obtained in tests made in Belgium.

**Design, Improvements in.** Modern Gas Producers (Sur la gazéification et les gazogènes industriels), L. Mauge. *Revue Industrielle*, vol. 53, nos. 24 and 25, Nov. and Dec. 1923, pp. 357-363 and 397-400, 9 figs. Deals with basic action of gas producers and describes latest improvements in producers and in processes for recuperation of hydrocarbons and ammonia; chemical equations for complete and partial combustion of carbon (to CO and CO<sub>2</sub>), together with corresponding heats of formation; characteristics of suction and pressure gas producers; typical modern designs.

**Wood as Fuel.** The Use of Wood in Gas Producers, C. Saxton. *Am. Ceramic Soc.—Jl.*, vol. 6, no. 12, Dec. 1923, pp. 1219-1223. Suggests possibility of using wood as source of gas supply for melting of glass and firing of clay products; comparative results actually obtained with same plant using coal and wood.

**GAS TURBINES**

**Theory.** Gas Turbines, J. Deschamps. *Engineer*, vol. 136, no. 3546, Dec. 14, 1923, pp. 646-647. Observations based on series of articles published in previous issues of same journal.

**GEAR CUTTING**

**Helical Gears.** Gear Cutting, R. J. McLeod and T. E. Calderwood. *Inst. Mar. Engrs.—Trans.*, Dec. 1923, pp. 388-410 and (discussion) 410-419, 14 figs. Authors state that tool determines shape of tooth, while machine determines spacing which depends upon master or main dividing wheel of machine; dividing wheel should be as large and as accurate as possible and no additional complication will compensate for initial errors; point out that special feature of "Sykes" machines is that dividing wheels are always larger in diam. than largest gear the machine will cut, so that there is always pro-rata reduction of initial errors.

**GEARS**

**Industry, Development of.** Development of the Gear Industry, E. W. Miller. *West. Machy. World*, vol. 4, no. 12, Dec. 1923, pp. 390-394, 20 figs. Emphasizes advisability and probable necessity of a painstaking inspection of all factors influencing gear industry. Paper read before Am. Gear Mfrs.' Assn. convention.

**Machining.** Machining Change-Gears, A. Clegg. *Mech. World*, vol. 74, nos. 1925 and 1928, Nov. 23 and Dec. 14, 1923, and vol. 75, no. 1931, Jan. 4, 1924, pp. 318-319, 366-367, and 2-3, 7 figs. Notes on machining change-gear blanks. Deals with handling, chucking, boring, turning, cutting speeds and feeds for both turning and boring, number of cuts that can proceed simultaneously, etc.

**Micarta Silent.** Silent Gears for Machine Tools, T. C. Roantree. *Machy. (N. Y.)*, vol. 30, no. 5, Jan. 1924, pp. 363-364, 2 figs. Properties of Micarta gears and applications in machine-tool field.

**Railway-Motor.** Railway-Motor Gears (Getriebe für Bahnmotoren), H. Mecke. *Elektrischer Betrieb*, vol. 21, no. 21, Nov. 10, 1923, pp. 233-236, 13 figs. Brief outline of improvements.

**Speed-Reduction.** Avamore Speed Reduction Gears. *Machy. (Lond.)*, vol. 23, no. 587, Dec. 27, 1923, p. 437, 4 figs. Describes system developed by Avamore Pump Co. of application of epicyclic gearing to reduction gears.

**Spiral.** Spiral Gearing, Henry E. Merritt. *Machy.*, vol. 23, nos. 579, 580, 583 and 586, Nov. 1, 8, 29 and Dec. 20, 1923, pp. 147-148, 177-179, 273-274 and 393-395, 15 figs. Nov. 1: Relation between shaft angle and spiral angles; end thrust. Nov. 8: Nomenclature and fundamental relations; velocity and force diagrams. Nov. 29: Circle diagrams for spiral angles, axial and transverse forces, and tooth and diameter ratios. Dec. 20: Efficiency, tooth reaction, and design diagrams.

**Standardization.** Proposed Standardization of Gearing. *Machy. (N. Y.)*, vol. 30, no. 5, Jan. 1924, pp. 374-377, 6 figs. Abstract of report before Am. Gear Mfrs.' Assn.

**Teeth, Specially Shaped.** The Production of Specially Shaped Gear Teeth, H. E. Stacey. *Machy. (Lond.)*, vol. 23, no. 584, Dec. 6, 1923, pp. 296-299, 5 figs. Milling-machine and hobbing-machine methods; tool design and construction; hob-tool method; method of setting hobbing machine; practical examples.

**Tooth Shape and Contact.** The Shape of Teeth and Period of Contact on Involute Gears (Zahnform und Eingriffsdauer von Evolventen-Zahnradern), H. Fischer. *Maschinenbau*, vol. 2, no. 21, July 26, 1923, pp. G247-G251, 9 figs. Tables and formulas for calculation of tooth shape and period of contact.

**Tooth-Shape Standardization.** Desiderata for the Standardization of Tooth Shape of Change Wheels (Gesichtspunkte für die Normung der Zahnform von Satzrädern), K. Kutzbach. *Maschinenbau*, vol. 2, no. 21, July 26, 1923, pp. G233-G240, 16 figs. Calculation of length of contact of gearing and degree of covering with rectilinear face toothing; degree of covering in pure zero gears.

**GOVERNORS**

**High-Speed Steam Engines.** The Governing of High-Speed Steam Engines. *Power Engr.*, vol. 19, no. 214, Jan. 1924, pp. 25-27, 3 figs. Notes advocating expansion or cut-off governors, stating case according to experience of W. Sisson & Co.

**GUN METAL**

**Admiralty, Founding.** The Founding of Admiralty Gun Metals and Allied Alloys, F. W. Rowe. *Foundry Trade Jl.*, vol. 28, no. 382, Dec. 13, 1923, pp. 508-510, 3 figs. Hardness of bronze and brass; gun-metal alloys; influence of remelting; liquation troubles; casting temperature; gun metal for pressure work; instruments necessary.

**H****HAMMERS**

**Pneumatic.** A Simple Pneumatic Hammer for Large and Small Forge Shops (Ein einfacher Lufthammer für die Gross- und Kleinschmiede), G. Bock. *Werkstattstechnik*, vol. 17, no. 22, Nov. 15, 1923, pp. 632-637, 28 figs. Describes patented Vulkan hammer, in which single oscillating plate serves as valve gear.

**HANGARS**

**Reinforced-Concrete.** Hangars on the State Aviation Field in Kbel near Prague (Hangars auf dem staatlichen Flugplatz in Kbel bei Prag), A. Brebera. *Beton u. Eisen*, vol. 22, nos. 17-18 and 19, Sept. 15 and Oct. 5, 1923, pp. 219-220 and 239-241, 6 figs. Describes construction of three reinforced-concrete hangars.

**HARDNESS**

**Testing Methods.** Hardness Tests Research, *Instn. Mech. Engrs.—Proc.*, vol. 1, no. 3, 1923. Includes following papers: Static Indentation Tests, R. G. C. Batson, pp. 401-422, 10 figs. Relation between Width of Scratch and Load on Diamond in the Scratch Hardness Test, G. A. Hankins, pp. 423-449, 17 figs.; and (discussion) pp. 449-487, 12 figs.

**HEALTH**

**Industrial Health-Service Plan.** How Do Employees Use the Hospital Facilities? M. R. Lott. *Indus. Management (N. Y.)*, vol. 67, no. 1, Jan. 1924, pp. 58-62, 5 figs. Summation of health-service work at Sperry Gyroscope Co.

**HEAT**

**Conversion of Work into.** How to Make Use of Unused Heat with Aid of Power (Wie kann man mit Hilfe von Kraft ungenutzte Wärme nutzbar machen?), J. Kaiser. *Zeit. des Bayerischen Revisions-Vereins*, vol. 27, nos. 20 and 21-22, Oct. 31 and Nov. 30, 1923, pp. 153-156 and 162-164, 6 figs. Discusses most expedient manner of converting work into heat; theory of process and its application.

**HEAT STORAGE**

**Apparatus for.** The Storage of Steam (Die Speicherung von Dampf zum Ausgleich von Feuerungs- und Verbrauchsschwankungen), Ludwig Heuser. *Wärme*, vol. 46, nos. 22, 23 and 24, June 1, 8 and 15, 1923, pp. 234-236, 247-249 and 257-260, 20 figs. Discusses general aspects in storage of energy, various storage methods and accumulator designs, and certain special applications with accumulator designs most suitable therefor.

**Electric Heat Accumulators.** Modern Electric Heating (Moderne Elektroheizungen), H. Schneider. *Elektrischer Betrieb*, vol. 21, no. 23, Dec. 10, 1923, pp. 259-263, 16 figs. Describes more important types of heat accumulators developed by Heat Accumulator Co., Inc., Berlin.

**HEAT TRANSMISSION**

**Principles.** Notes on Heat Transmission, D. M'Keracher. *Gas Jl.*, vol. 164, no. 3162, Dec. 19,

1923, pp. 778-779. What heat is; general principles underlying its mechanism; physical definition of conduction, convection, and radiation.

**Theory.** Fire and Heat (Le feu, la chaleur), Ch. Roszak. *Chaleur & Industrie*, vol. 4, nos. 38 and 41, June and Sept. 1923, pp. 515-518 and 624-631. Discusses important aspects of fuel economy and of heat transmission in connection with it.

**Tubes.** Heat Transmission through Tubes under Variable Temperatures of Liquids (Wärmedurchgang durch Röhren bei veränderlichen Flüssigkeitstemperaturen), H. de Grahl. *Wärme*, vol. 46, nos. 46 and 47-48, Nov. 23 and 30, 1923, pp. 499-502 and 512-513, 9 figs. Results of experimental investigation; results show that coefficient of transmission is much better with parallel than with countercurrent.

**HEAT TREATING**

**Principles and Applications.** Heat Treating—Its Principles and Applications, Chas. H. Fulton, Hugh M. Henton and Jas. H. Knapp. *Iron Trade Rev.*, vol. 73, nos. 14, 16, 18, 20, 22, 24 and 26, Oct. 4, 18, Nov. 1, 15, 29, Dec. 13 and 27, 1923, pp. 943-946 and 950; 1099-1102, 3 figs.; 1240-1244, 12 figs.; 1369-1372, 11 figs.; 1483-1486 and 1493, 4 figs.; 1603-1607, 4 figs.; and 1728-1731, 2 figs.; Oct. 4: Steel and other commercial iron products. Oct. 18, Nov. 1 and 15: Structure of iron and steel. Nov. 29, Dec. 13 and 27: Relation of structure to physical properties.

**HEATING, ELECTRIC**

**Industrial.** Electric Heating in Industry (Die Elektrowärme in der Industrie), Fr. Jordan. *Elektrischer Betrieb*, vol. 21, no. 23, Dec. 10, 1923, pp. 249-252, 7 figs. Application of electric-arc, induction and resistance furnaces in chemical, metallurgical and technical industries, for room heating, etc.

**Progress.** The Progress in Electrical Heating in the Last Decade (Der Fortschritt der elektrischen Heiztechnik im letzten Jahrzehnt), E. Zeulmann. *Elektrotechnik u. Maschinenbau*, vol. 41, no. 48, Dec. 2, 1923, pp. 689-696, 13 figs. Review of most important developments, including electrode boiler, storage, heaters, air heaters, improvements in room heating, etc.; electric heating of industrial machinery and its advantages.

**HEATING, HOT-AIR**

**Large Building.** Heating a Seven-Acre Building with Warm-Air. *Sheet Metal Worker*, vol. 14, no. 24, Dec. 21, 1923, pp. 891-893, 5 figs. Describes system installed in Am. Roy. Exposition Bldg. at Kansas City, with seating capacity of 15,000.

**Ventilation and.** Ventilation and Warm-Air Heating, G. A. Voorhees. *Sheet Metal Worker*, vol. 14, nos. 3 and 7, Mar. 2 and Apr. 27, 1923, pp. 81-82 and 249-250, 3 figs. Mar. 2: Relation of temperature to ventilation. Apr. 27: Circulation of air as it affects ventilating efficiency of a warm-air heating plant.

**HEATING, HOT-WATER**

**Piping and Fittings Problems.** Problems Affecting Hot Water Piping and Fittings in Heating Plants, S. H. Woodbridge. *Heat & Vent. Mag.*, vol. 20, no. 12, Dec. 1923, pp. 45-47, 3 figs. With special reference to gravity two-pipe systems with overhead supply and to equalization of water flow through riser and drop piping.

**HELIUM**

**Use in Dirigibles.** The Use of Helium in Dirigibles, G. A. Crocco. *Int. Aeronautics*, vol. 1, no. 4, Nov. 1923, pp. 214-215. Calculates annual gas consumption of a dirigible and total tonnage of airships that can be supplied with limited American production of helium.

**HOISTS**

**Mine.** Novel Application of Dynamic Braking on Large Slope Hoist, R. W. McNeill. *Coal Age*, vol. 25, no. 2, Jan. 10, 1924, pp. 35-39, 8 figs. Peculiar requirements of hoisting and lowering speeds under widely differing loads while handling coal, supplies and men necessitates unusual type of control; success of installation at Shenandoah, Pa., proves efficacy of plan.

**HOUSING**

**Industrial Village.** Industrial Village on Sound Basis. *Iron Age*, vol. 113, no. 1, Jan. 3, 1924, pp. 9-14, 14 figs. Developments of village established by Kinkora Works of John A. Roebing's Sons Co.; houses for employees only; providing activities outside mill; caring for workers' savings; community services.

**Mine and Mill Workers.** Housing Workmen at Krupp Mines and Works, H. Hermanns. *Coal Industry*, vol. 6, no. 12, Dec. 1923, pp. 508-511, 8 figs. Permanent and attractive dwellings provided for employees of organization; low rental charges.

**HYDRAULIC TURBINES**

**Double-Wheel Horizontal.** Large Turbines at Swedish Hydro-Electric Stations, F. Johnstone-Taylor. *Elec. Times*, vol. 64, no. 1677, Dec. 6, 1923, pp. 593-594, 3 figs. Describes large double-wheel horizontal units installed at large power station.

**Governor-Pump Operation.** Power Supply for Governor Pumps, Ralph Brown. *Power*, vol. 59, no. 3, Jan. 15, 1924, pp. 92-93, 2 figs. Describes economical system of governor-pump operation.

**Low Falls.** Hydraulic Turbines for Low Falls, F. Johnstone-Taylor. *Power Engr.*, vol. 19, no. 214, Jan. 1924, pp. 5-7, 4 figs. Describes low-fall Francis turbine; new types of runner; the hydracone; Banki turbine.

**Pelton Wheels.** The Genesis of the Pelton Wheel, A. T. Parsons. *Am. Mach.*, vol. 60, no. 2, Jan. 10, 1924, pp. 61-63, 7 figs. How forty-niner and his need for mining equipment developed machine business in San Francisco; modern methods of building large hydraulic turbines.

**Raanaasfoss Station, Norway.** Turbines at

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

Raanaasfoss Power Station, Hallgrim Thoresen. Can. Engr., vol. 45, nos. 25 and 26, Dec. 18 and 25, 1923, pp. 581-585 and 601-606, 19 figs. Details of hydroelectric power development near Christiania, Norway; six turbines giving total output of 72,000 hp. at 40-ft. head and 107 r.p.m., and a water consumption of 3,200 cu. ft. per sec.; details of Voith turbines; efficiency tests; apparatus for measuring water volume.

#### HYDROELECTRIC DEVELOPMENTS

**Bavaria.** The Bayernwerk, K. Ruegg. Eng. Progress, vol. 4, no. 11, Nov. 1923, pp. 241-243, 3 figs. Describes system being erected to make supply of electricity to whole of Bavaria as economical as possible; with 110,000-volt network it will be possible to completely utilize available great water power, which for a part can also be accumulated (for present, Walchen Lake and Isar River), so that land which has no coal deposits of its own can decrease import of coal.

**California.** Pit River Hydro-electric Power Development, C. W. Geiger. Nat. Engr., vol. 27, no. 12, Dec. 1923, pp. 584-586, 2 figs. General description of latest additions to Pacific Gas & Elec. Co.'s system; details of problems faced in construction of plant.

**Norway.** To Build Three High-Head Power Plants in Norway, E. Svangøe. Eng. New-Rec., vol. 92, no. 3, Jan. 17, 1924, pp. 106-107, 2 figs. Heads up to 3000 ft.; stream flow to be supplemented by storage; many miles of tunnels.

**Oregon.** Oak Grove Power Project on Clackamas River, W. A. Scott. Eng. World, vol. 23, no. 6, Dec. 1923, pp. 333-337, 11 figs. Construction progress made on hydroelectric project of Portland Ry., Light & Power Co. of Portland, Ore.

**Status 1923.** Status of Hydro-Electric Construction. Elec. World, vol. 83, no. 1, Jan. 5, 1923, pp. 27-29, 1 fig. 29 projects now being constructed under licenses from Federal Power Commission. California leads in number and horsepower of projects now being developed.

**Tasmania.** Electricity Supply in Tasmania. Indus. Australian & Min. Standard, vol. 70, no. 1825, Nov. 22, 1923, pp. 785-787, 6 figs. Details of Tasmanian Government hydroelectric scheme; equipment now provided is capable of output of 63,000 hp. which is available for use of industrial undertakings established in the island.

**United States, 1923.** Hydro-Electric Development Shows Unprecedented Activity. Power, vol. 59, no. 1, Jan. 1, 1924, pp. 12-16, 8 figs. Over 2,000,000 horsepower of new hydroelectric plants and extensions to old installations, in projects of 10,000 hp. and larger, were completed during 1923 or are now under construction in United States.

#### HYDROELECTRIC PLANTS

**Accumulating Plant.** Hydroelectric Accumulating Plant of the Firm "Manufactures Hartmann et Fils," Münster, Alsace (Hydroelektrische Akkumulierungsanlage der Firma Manufactures Hartmann et Fils, Münster i. Els.), E. Rabner. Siemens-Zeit., vol. 3, no. 11, Nov. 1923, pp. 499-506, 11 figs. Details of hydroelectric storage plant, built by firm of Locher, Zurich; electrical equipment supplied by Siemens-Schuckert Works.

**Canada.** An Important Northern Power Plant, H. L. Sanborn. Elec. News, vol. 32, no. 23, Dec. 1, 1923, pp. 58-60, 6 figs. Hydroelectric development of Abitibi Power & Paper Co.; notes on water control, switching control, transmission lines, substations, and mill feeders.

**Hydraulic Machinery.** Hydroelectric Plants and Hydraulic Machinery (Wasserkraftanlagen und Wasserkraftmaschinen), A. Budau. Zeit. des Oesterr. Ingenieur- u. Architekten-Vereins, vol. 75, no. 31-32, Aug. 10, 1923, pp. 186-197, 18 figs. High-pressure plants: older and more recent hydroelectric-plant arrangements; corrosion and its prevention; Pelton vs. Francis turbine. Medium-pressure plants: Esibe control method; ice difficulties. Low-pressure plants: development of high-speed turbines; Storek-Kaplan turbine; horizontal and vertical shaft; modern draft tubes; pros and cons of high-speed turbine.

**Miniature.** A Miniature Water-Power Installation, D. C. Miller. Elec. Rev., vol. 93, no. 2405, Dec. 28, 1923, pp. 969-971, 6 figs. An 85-volt 550-watt capacity plant.

**Sweden.** Power Station at Forshuvudforsen (Bergslagens nya Kraftverk vid Forshuvudforsen), M. Serrander. Teknisk Tidskrift (Väg- och Vattenbyggnadskonst), vol. 53, no. 43, Oct. 27, 1923, pp. 145-155, 27 figs. New power station in Dalälven in Sweden, built by Stora Kopparbergs Aktiebolag, is arranged for three units, each of 8000 hp., two of which are already in operation; water wheels are constructed for 83 1/3 r.p.m., at which they are warranted to have efficiency of 86 per cent for water consumption of 60 cu. m. per sec.; generators are rated at 6500 kva., 11,000 volts and 50 cycles.

## I

#### IMPACT TESTING

**Notched-Bar Tests.** Notch Action in Upsetting Test (Ueber Kerbwirkungen beim Stauchversuch), G. Sachs. Stahl u. Eisen, vol. 43, no. 52, Dec. 27, 1923, p. 1587, 3 figs. Tests on cast-iron specimens; relations between notch diameter and breaking load.

**Theory and Practice of the Notched-Bar Test** (Theorie und Praxis der Kerbschlagprobe), P. Fillunger. Schweizerische Bauzeitung, vol. 82, nos. 21 and 22, Nov. 24 and Dec. 1, 1923, pp. 265-268 and 284-289, 18 figs. Impact process is divided into four impact periods, each of which is discussed; experimental examination of theory.

#### INDUSTRIAL MANAGEMENT

**Factories.** Rational Works Management in Factories, J. A. Davenport and J. I. Emery. Indus. Management (Lond.), vol. 9, nos. 9, 10, 11, 12, 13, and 14, nos. 1, 2, 4, 5, 9 and 12, May 3, 17, 31, June 14, 28, July 12, 26, Aug. 23, Sept. 6, Nov. 15 and Dec. 13, 1923, pp. 259-260, 291-294, 323-325, 355-356, 387-389, 3-4, 37-40, 93-94, 119-120, 270-272, and 326-327, 9 figs. May 3: Need for sound organization and sane administration. May 17: Factory personnel. May 31 and June 14: Scope and limitations of works management. June 28 and July 12: Scientific management. July 26: Standardization. Aug. 23: Labor-saving devices. Sept. 6: Inspection methods. Nov. 15: Training. Dec.: Payment by results.

**Planning.** Planning the Repetitive Manufacture of Automobile Wheels, Wm. B. Ferguson. Management & Administration, vol. 7, no. 1, Jan. 1924, pp. 31-38, 70 figs. Methods used in quantity production or making of great number of parts of same design with respect to those features which are more or less peculiar to this class of work.

**Production and Sales, Coördination.** Co-ordination of Production with Sales for Oil Companies, E. G. Reynolds. Management & Administration, vol. 7, no. 1, Jan. 1924, pp. 85-89, 2 figs. Setting production schedule; adjustment of estimated production and sales; interpretation of revised quota; types of records necessary to execute plan; regulation of refinery operations.

**Purchasing.** The Science of Buying Material, P. M. Atkins. Indus. Management (N. Y.), vol. 67, no. 1, Jan. 1924, pp. 19-23. Notes on purchasing agent's contribution to smooth production flow.

**Scientific.** The Art of Management, O. Sheldon. Taylor Soc.—Bul., vol. 8, no. 6, Dec. 1923, pp. 209-214. A British point of view.

**Statistical Methods in Business.** The Present Status of Statistical Research in the Administration of Business, C. L. Sweeting and D. K. Pfeffer. Taylor Soc.—Bul., vol. 8, no. 6, Dec. 1923, pp. 215-218. Results of authors' attempt to ascertain extent to which precise statistical procedures are being used as aids in stabilization of business; compilation of answers to questionnaire.

#### INDUSTRIAL RELATIONS

**Economic Courses for Employees.** Increased Industrial Acquaintanceship. Iron Age, vol. 113, no. 3, Jan. 17, 1924, pp. 211-214, 5 figs. Progress in 1923 in relations with employees at Plant of Bridgeport Brass Co., Bridgeport, Conn.; courses in economics to explain business problems; service club; pensions to superannuated employees; group insurance plan.

**Scientific Management and Labor.** Two Pioneer Papers on Industrial Relations, Rob. G. Valentine. Taylor Soc.—Bul., vol. 8, no. 6, Dec. 1923, pp. 225-236, 1 fig. Reprint of following articles: Scientific Management and Organized Labor; and The Progressive Relation between Efficiency and Consent, published originally in 1914 and 1915, respectively.

#### INSPECTION

**Industrial.** Industrial Inspection, Int. Labour Rev., vol. 8, no. 6, Dec. 1923, pp. 915-929. Factory inspection in Great Britain in 1922; industrial inspection in Victoria, Sweden, and Netherlands.

#### INTERNAL-COMBUSTION ENGINES

**Constant-Compression.** The Essentials of a Successful Constant-Compression Engine, C. E. Sargent. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 5-10, 9 figs. It is shown that constant-compression engines in which throttling is eliminated are feasible in construction; permit admitting of inert gas at less than full load during first part of induction stroke and of burnable gas during last part; describes new type developed to prove that engine could be designed to maintain constant compression and mean effective pressure commensurate with load.

**Cooling, Influence of.** The Influence of Cooling of Internal-Combustion Engines on Efficiency (Der Einfluss der Kühlung der Verbrennungsmaschinen auf die Leistung), W. Schlachter. Maschinenbau, vol. 2, no. 20, July 13, 1923, pp. B241-B243, 8 figs. Discusses influence of cooling losses and measures for reducing them and increasing efficiency of engine.

**Crankless.** Crankless Internal Combustion Engine. Indus. Australian & Min. Standard, vol. 70, no. 1824, Nov. 15, 1923, pp. 746-747, 3 figs. Technical particulars of 8-cylinder crankless engine, 3.312-in. bore by 3.51-in. stroke; 35.1 rated horsepower (S. A. E.).

**Cylinder Head, Shape of.** The Shape of Internal-Combustion Engines (Beitrag zur Gestaltung von Verbrennungsmotoren), H. G. Bäder. Maschinenbau, vol. 2, no. 20, July 13, 1923, pp. G217-G220, 5 figs. Calculation of heat accumulations and losses on circumference of cylinder-head openings, showing that number and shape of openings have more influence on operating safety of cylinder heads than absolute degree of heat load.

**Heat Losses.** Heat Losses in Internal-Combustion Engines (Die Wärmeverluste in Verbrennungsmotoren), H. Schmolke. Wärme, vol. 46, no. 45, Nov. 9, 1923, pp. 489-491. Review of latest investigations of temperature, heat absorption and heat transmission in gas engines.

**Heat Transmission in.** Heat Transmission in Internal-Combustion Engines (Der Wärmeübergang in der Verbrennungskraftmaschine), Wilhelm Nusselt. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 264, 1923, 79 pp., 15 figs. Discusses measurement of power of reflection of internal spherical surface; theory of heat radiation of hot gases; calculation of heat radiation based on tests; tests and their results; comparison with earlier tests and study of play of piston.

**Ignition Patents.** Internal-Combustion Engines, Igniting in. Abridgments of Specifications (Lond.),

Class 7 (iv), 1923, Period—A. D. 1916-20, 129 pp. Patents for inventions.

**Temperature and Thermal Stresses.** The Course of Temperature and Thermal Stresses in Internal-Combustion Engines (Temperaturverlauf und Wärmespannungen in Verbrennungsmotoren), G. Eichelberg. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 234, 1923, 46 pp., 24 figs. on supp. plates. Deals with temperature of gases and heat transmission; course of temperature and thermal stresses in cylinder walls.

[See also AIRPLANE ENGINES; AUTOMOBILE ENGINES; DIESEL ENGINES; GAS ENGINES; OIL ENGINES.]

#### IRON

**Carbonizing with Oxy-Acetylene Flame.** Surface Hardening with Oxy-Acetylene Flame, J. F. Springer. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 36-37. Points out that torch process will mark out for itself field sharply defined and superior to its competitors; limitations of oxy-acetylene carbonizing; main advantages of torch process; experiments on cast steel.

#### IRON AND STEEL

**Corrosion.** The Corrosion of Iron and Steel, J. Newton Friend. Chem. Trade J. & Chem. Engr., vol. 73, no. 1909, Dec. 21, 1923, p. 734. J. N. Friend's colloid theory. Abstract of paper read before Hull Chem. & Eng. Soc., Dec. 11, 1923.

#### IRON CASTINGS

**Bearing Brackets.** Practical Problems of Casting and Patternmaking (Praktische Betriebsfragen aus der Giesserei und Modelltischlerei). Giesserei-Zeitung, vol. 20, no. 24, Nov. 15, 1923, pp. 463-466, 6 figs. Deals with cast-iron bearing brackets for electric machines, their casting faults, causes and prevention.

**Hardness, Causes of.** Physical Factors Affect Iron, J. H. Hopp. Automotive Industries, vol. 50, no. 1, Jan. 3, 1924, pp. 11-12. Hard castings ascribed to chemical content in many cases are due to causes other than metal; shrinkage alleviated by proper gates and risers. (Abstract.) Paper before Chicago Foundrymen's Club.

**Shrinkage and Cavities.** Shrinkage and Cavities in Iron Castings, Engineering, vol. 116, no. 3026, Dec. 28, 1923, p. 809. Study of relations between formation of cavities in cast iron and composition and pouring temperatures of material. (Abstract.) Translated from Stahl u. Eisen, Sept. 27.

**Titanium in.** Titanium in Gray Iron Castings (Ueber Titan im Grauguss), E. Piwowarsky. Stahl u. Eisen, vol. 43, no. 49, Dec. 6, 1923, pp. 1491-1494, 7 figs. Critical discussion of earlier tests and works on influence of titanium; account of author's tests and results.

## J

#### JIGS

**Drill.** Single v. Multiple-operation Jigs, C. J. Williams. Machy. (Lond.), vol. 23, no. 585, Dec. 13, 1923, pp. 329-331, 5 figs. Problem in drill jig design.

## L

#### LATHES

**Balance and Cutting Tests.** Investigation of Turning (Die Untersuchung der Dreharbeit), H. Klopstock. Werkstattstechnik, vol. 17, nos. 23 and 24, Dec. 1 and 15, 1923, pp. 645-654 and 666-672, 44 figs. Calculation of balance of lathe; law of cutting process; development of new cutting form; analysis of cutting process.

**Turret.** 7 and 8 1/2-inch Centre Combination Turret Lathes. Machy. (Lond.), vol. 23, no. 586, Dec. 20, 1923, pp. 396-399, 8 figs. New developments by H. W. Ward & Co., Birmingham.

#### LIFTING MAGNETS

**Types and Applications.** Load-Lifting Equipment for Cranes (Die Lastaufnahmemittel der Krane), R. Hänchen. Maschinenbau, vol. 3, no. 1, Oct. 11, 1923, pp. G1-G2, 4 figs. Types and main uses of lifting magnets.

#### LOCOMOTIVE BOILERS

**Design.** Locomotive Type Boilers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, p. 27, 1 fig. Losses due to air leakage and radiation reduced to minimum.

#### LOCOMOTIVES

**Electric.** See ELECTRIC LOCOMOTIVES.

**50-Per cent Cut-Off.** The Fifty Per Cent Cut-Off Locomotive, W. F. Kiesel, Jr. N. Y. R. R. Club, vol. 34, no. 1, Dec. 1923, pp. 7138-7151, 6 figs. Describes locomotive which in expansion ratio approximates compound locomotive, in uniformity of torque practically equals three-cylinder locomotive, and in simplicity of parts is same as ordinary two-cylinder locomotives; advantages, and tests made.

**4-6-0.** Four-Cylinder 4-6-0-Type Locomotive; Great Western Railway. Engineering, vol. 116, no. 3024, Dec. 14, 1923, pp. 742-743, 6 figs. partly on supp. plate. Particulars of new express locomotives turned out at Swindon Works.

**Freight-Tonnage Ratings.** Locomotive Freight Tonnage Ratings, W. U. Appleton. Can. Ry. & Mar.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

World, no. 310, Dec. 1923, pp. 565-569, 5 figs. Discusses the two main factors governing correct tonnage rating for a specified subdivision, viz., drawbar pull exerted by locomotive, and resistance of train, and the minor factors influencing these.

**Great Britain, 1923.** British Locomotives of 1923. Engineer, vol. 137, no. 3549, Jan. 4, 1924, pp. 6-7, 6 figs. partly on supp. plate. Review of developments.

**Heavy Freight.** Heavy 2-10-2 Type Locomotive, B. & O. R. R. Ry. Rev., vol. 73, no. 26, Dec. 22, 1923, pp. 889-890, 1 fig. Locomotive designed to combine speed capacity of road's Mikado-type heavy road engine with exceptional hauling capacity.

**Internal-Combustion.** A 38/40 Hp. Internal-Combustion Locomotive for the Gold Coast Railway, Ry. Gaz., vol. 39, no. 26, Dec. 28, 1923, pp. 813 and 826, 2 figs. Details of a 3-ft. 6-in. gage locomotive built for use in connection with Takoradi Harbor scheme; 0-4-0 type; fitted with two-speed gear in each direction; wheelbase 4 ft.

**Mikado.** Canadian National Mikado Type Locomotive, C. E. Brooks. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 6-9, 7 figs. Belpaire fireboxes and extended side sheets reduce troubles from bad water in Western Canada.

**Performance.** Some British Locomotive Performances, J. T. Burton-Alexander. Engineer, vol. 136, no. 3548, Dec. 28, 1923, pp. 684-685. Account of runs on British railways which date back to about 20 years ago.

**Production Statistics, 1923.** Record-Breaking Increase in Motive Power. Ry. Age, vol. 70, no. 1, Jan. 5, 1924, pp. 77-82. Gives table of locomotive orders for 1923 for service in United States.

**Shipment by Water.** The Shipment of Locomotives to India. Engineering, vol. 116, no. 3026, Dec. 28, 1923, pp. 802-804, 6 figs. partly on p. 806. Describes methods employed by Armstrong, Whitworth & Co. in shipping locomotives to Calcutta without dismantling.

**Steam-Turbine.** The Steam Turbine as Locomotive Drive (Die Dampfturbine als Lokomotivtrieb), U. R. Ruegger. Schweizerische Bauzeitung, vol. 82, no. 23, Dec. 8, 1923, pp. 299-303, 9 figs. Discusses most important types of steam-turbine locomotives, including Ramsay, Zoelly and Ljungström locomotives.

**Tank.** Powerful 2-6-4 Type Tank Locomotives for the Bombay, Baroda & Central India Railway. Ry. Gaz., vol. 39, no. 25, Dec. 21, 1923, p. 794, 2 figs. Dimensions and principal data.

**10-Wheel.** Pennsylvania Ten-Wheel Passenger Locomotive. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 16-18, 3 figs. Class G5S, new design for local passenger service with 68-in. drivers, develops 41,328-lb. tractive force.

## LUBRICANTS

**Railroad Engine Greases.** The Manufacture of Railroad Engine Greases, H. L. Kauffman. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 13-14. Discusses materials and processes entering into production of these lubricants.

## LUBRICATING OILS

**Testing.** A New and Universal Method of Testing Lubricating Oil (Eine neue einfache und universelle Schmierölprüfweise), H. Dallwitz-Wegner. Petroleum, vol. 19, no. 35, Dec. 10, 1923, pp. 1247-1253, 9 figs. Describes improved method of measuring capillary properties.

## LUBRICATION

**Bearings.** Oil and Bearing Tests in Machine Laboratory of the German National Physico-Technical Institute (Ueber Öl- und Lagerversuche im Maschinenlaboratorium der Physikalisch-Technischen Reichsanstalt), V. Vieweg. Glasers Annalen, vol. 93, no. 10, Nov. 15, 1923, pp. 111-113, 6 figs. Describes optical method of investigating film formation of lubricating medium in a bearing.

**The Lubrication of Bearings** (Die Schmierung von Oellagern), A. Michels. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 49, Dec. 8, 1923, pp. 1100-1103, 17 figs. Study of theory of lubrication; so-called equation of Osborne Reynolds is derived according to Sommerfeld method, from which conclusions are drawn for production of bearings.

## LUMBER

**Size and Grade Standardization.** Standardized Sizes and Grades for Lumber. Contract Rec. & Eng. Rev., vol. 37, no. 48, Nov. 28, 1923, pp. 1125-1127. Recommendations formulated by committee, covering standard lumber classification, standard grade names and classifications, standard yard lumber sizes, method of lumber measurement, standard shipping weights and shipping and other provisions, which it is anticipated will be accepted by the industry.

# M

## MACHINE SHOPS

**Repair Orders.** That Repair Order, H. S. Riggs. Am. Mach., vol. 50, no. 26, Dec. 27, 1923, pp. 933-938, 7 figs. System of handling repair orders quickly, without necessitating personal attention, as practiced in plant of Lodge & Shipley Machine Tool Co., Cincinnati, O.

## MACHINE TOOLS

**Adjustments.** Adjustments on Machine Tools, F. Horner. British Machine Tool Eng., vol. 2, no. 24, Nov.-Dec. 1923, pp. 719-724, 12 figs. Discusses class of adjusting devices that deals with the various move-

ments essential to operation of a machine and brings slides, tables, spindles, heads, steadies, and other elements into suitable positions, and the various points that arise in connection therewith.

**Developments 1923.** Machine Tool Developments in 1923. Machy. (Lond.), vol. 23, no. 585, Dec. 13, 1923, pp. 345-376, 48 figs. Review of year's progress, featuring principal improvements in machine-tool design.

**Principal Developments in Shop Equipment.** L. C. Morrow. Am. Mach., vol. 60, no. 3, Jan. 17, 1924, pp. 81-111, 213 figs. Semi-annual résumé of machines, tools and accessories described in Shop Equipment News section of this journal during last six months of 1923. See also Index of Manufacturers, pp. 112-114.

**Plate and Bar-Working.** Plate and Bar-working Tools. Machy. (Lond.), vols. 22 and 23, nos. 561, 562, 564, 565, 567, 568, 570, 572, 574, 578, 581, 582 and 587, June 28, July 5, 19, 26, Aug. 9, 16, 30, Sept. 13, 27, Oct. 25, Nov. 15, 22 and Dec. 27, 1923, pp. 389-395, 429-437, 511-516, 541-547, 589-593, 637-639, 695-699, 765-769, 829-832, 104-107, 211-214, 241-244 and 409-413, 162 figs. Their application to shipyard, boiler, and tank work; locomotive and car building; girder and structural work; steel-works operation; hydraulic plate stretching, plate-bending rolls; flanging operations; trimming, girder milling, and plate-edge planing.

**Railway-Wheel Production.** Machine Tools for Railway Wheel Production. Machy. (Lond.), vol. 23, no. 586, Dec. 20, 1923, pp. 377-380, 5 figs. Boring and turning mill of novel design tooled for production of wheel centers.

**Safety Devices.** Accident Prevention in the Machine-Tool Industry (Unfallverhütung in der Werkzeugmaschinenindustrie), H. Pennig. Maschinenbau, vol. 3, no. 2, Oct. 25, 1923, pp. B9-B10, 5 figs. Describes special protective device for a lathe, and safety devices for planing machines. See also article by G. Puschmann, entitled, Modern Safety Devices for Punching Machines, pp. B10-B12, 4 figs.; Safety Devices for Woodworking Machines, R. Heinel, pp. B12-B13; and Modern Safety Devices for Agricultural Machines, L. Hofer, pp. B13-B14, 3 figs.

**Standardized Parts.** The Constructive Development of Standardized Machine Parts (Der konstruktive Aufbau genormter Maschinenteile), H. Lasswitz. Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. B22-B24, 8 figs. Discusses factors which influence constructive development.

## MACHINERY

**Foundations.** Machinery Foundations. Power Engr., vol. 19, no. 214, Jan. 1924, pp. 10-11. Notes on foundations for steam engines, turbo-alternators and heavier kinds of pumping plant.

## MACHINING METHODS

**Defects, Overcoming.** Overcoming Defects in Machining Raw Materials, T. H. Turner. Can. Machy., vol. 30, no. 25, Dec. 20, 1923, pp. 20-23. In considering the various types of defects, such as one encounters during machining of ferrous materials, uses to which finished product will be put must be borne in mind.

## MARINE BOILERS

**Prudhon-Capus.** A Marine Boiler with Accelerated Circulation. Mar. Engr. & Nav. Architect, vol. 47, no. 556, Jan. 1924, pp. 33-34, 1 fig. Prudhon-Capus boiler to be adopted on new French liners.

**Scotch.** Scotch Marine Boilers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 28-30, 5 figs. General considerations of types and details of construction.

## MATERIALS

**Testing.** Experimental Arrangements for Determination of Oscillating Strength of Materials (Versuchsanordnungen zur Bestimmung der Schwingungsfestigkeit von Materialien), O. Föppl. Maschinenbau, vol. 2, no. 25-26, Sept. 29, 1923, pp. G278-G280, 8 figs. Discusses different testing methods for duration tests, and compares advantages and disadvantages.

## MATERIALS HANDLING

**Pneumatic Conveying.** The Pneumatic Conveying of Materials, M. W. Fotta. Indus. Management (N. Y.), vol. 77, no. 1, Jan. 1924, pp. 9-15, 10 figs. Present state of development; principles involved; special problems encountered.

## METAL WORKING

**Faults, Overcoming.** Correcting Faults in Metal-Working, F. Horner. English Mechanics, vol. 118, no. 3065, Dec. 21, 1923, pp. 310-311, 3 figs. Discusses common faults arising in engineering machine work and their remedies.

## METALS

**Cold Working.** Alteration in Metal Structure by Cold Working (Ueber Strukturänderungen in Metallen durch Kaltbearbeitung), M. Polanyi. Zeit. für Physik, vol. 17, no. 1, July 30, 1923, pp. 42-53. A new consideration is introduced, namely that, with cubical lattices, different possible gliding directions can compete with one another; explains structures of metal foils.

**Diffusion of Hydrogen Through.** The Diffusion of Hydrogen Through Metals, H. G. Deming and C. Hendricks. Am. Chem. Soc.—Jl., vol. 45, no. 12, Dec. 1923, pp. 2857-2864, 2 figs. Describes apparatus for studying rate of diffusion of gases through definitely measurable areas of sheet metal at definite, uniform temperatures.

**Heat Treatment.** The Heat Treatment of Metals, E. Pull. Machy. Market, nos. 1208 and 1209, Dec. 28, 1923 and Jan. 4, 1924, pp. 27-28 and 25-26, 3 figs. Definitions of words and phrases in general use in connection with annealing, hardening and tempering.

**Properties at Elevated Temperatures.** Mechanical Properties of Metals at Elevated Temperatures, D. H. Ingall. Metal Industry (Lond.), vol. 23, no. 24, Dec. 14, 1923, pp. 531-532. Users' and manufacturers' requirements; critical temperature; significance of viscous condition. Abstract of paper read before Birmingham Met. Soc.

**Twin Crystallite Formation in.** Twin Crystallite Formation in Certain Metals and Alloys (Ueber Zwillingsbildung in einigen Metallen und Legierungen), A. Schrader and E. Weiss. Zeit. für Metallkunde, vol. 15, no. 10, Oct. 1923, pp. 284-285, 3 figs. Twin crystallite formations in copper, brass, and bronze as proof of a previous strain with subsequent annealing.

## MOTOR-TRUCK TRANSPORTATION

**Economic Position.** The Economic Position of Motor Transport. Sci. Am., vol. 130, no. 1, Jan. 1924, pp. 10-12, 6 figs. Discussion of motor-vehicle economy and mobility as realized in truck and bus.

**Interurban Movements, Allocation of Truck in.** Motor Transportation, L. W. McIntyre. Ry. Club of Pittsburgh—Proc., vol. 22, no. 8, Sept. 27, 1923, pp. 173-188 and (discussion) 188-200. Indicates necessity for study of motor transportation as a possible means of further improving present transportation facilities. Comparison of rail and truck rates; comparison of tonnage and distance hauled; discussion of whether "short haul" is unprofitable to railways; terminal practice and costs; regulation.

## MOTOR TRUCKS

**American-La France.** American-La France 2 1/2-Tonner Has Air-Cooled Disk Brake. Motor Transport (N. Y.), vol. 29, no. 10, Dec. 15, 1923, pp. 339-340, 5 figs. Describes new truck chassis of American-La France Fire Engine Co., Elmira, N. Y., and Bloomfield, N. J., having disk-type air impeller, cooled transmission brake and double-reduction rear axle designed also for use of worm drive.

**Body Design.** The Factor of Safety in Body Design, H. G. Bersie. Motor Transport (N. Y.), vol. 29, no. 10, Dec. 15, 1923, pp. 336-338, 5 figs. Strengths of various body materials and their relation to impact stresses and shocks; standard dimensions are recommended.

**British Show.** Eight New Speed Trucks Are Shown at British Exhibit, M. W. Bourdon. Automotive Industries, vol. 49, no. 25, Dec. 20, 1923, pp. 1240-1242, 10 figs. Designs are results of War Department offer to pay subsidy for vehicles of this type; flexible six-wheelers also prominent in commercial car show.

**The Commercial Motor Transport Exhibition.** Automobile Engr., vol. 13, no. 184, Dec. 1923, pp. 401-408, 28 figs. Outstanding features.

**Electric.** General Design and Urban Performance of Electric Trucks, J. G. Carroll. Soc. Automotive Engrs.—Jl., vol. 14, no. 1, Jan. 1924, pp. 23-29 and (discussion) 29-30 and 35, 12 figs. Considerations that influence design and location of motors and various methods by which their control is effected; details of construction and factors that determine selection of best type of drive; examination of requirements of delivery systems operating over city routes shows that electric truck is capable of meeting practically all demands of mileage, topographical conditions and speed; points out its advantages.

## OIL ENGINES

**Cylinder Heads.** Designing Oil Engine Cylinder Heads, R. Hildebrand. Oil Engine Power, vol. 1, no. 12, Dec. 1923, pp. 603-607, 8 figs. Discusses cause of cracked cylinder head; how crack can be detected; when cylinder head must be replaced by new one; what causes blowing of gasket between head and cylinder.

**Heavy-Oil.** Some Considerations Affecting the Choice of a Heavy-Oil Engine, G. Porter. Diesel Engine Users Assn. (Lond.), no. 37, 30 pp. (includes discussion). Paper read at meeting on Nov. 16, 1923. Principal types available; fundamental principles; fuel oils; fuel consumption; conditions affecting combustion; particulars of design; cooling water; lubrication; costs.

**Marine.** A New Type of Neptune Marine Oil Engine. Mar. Engr. & Nav. Architect, vol. 47, no. 556, Jan. 1924, pp. 5-8, 5 figs. Details of "B" type; special cylinder design; scavange and bilge pumps lever-driven off crossheads; fuel valve lift control.

**Motor Ships and Marine Oil Engines in 1923.** Engineer, vol. 137, no. 3549, Jan. 4, 1924, pp. 7-10, 5 figs. partly on supp. plate. Statistics of production and brief descriptions of most important types of oil engines.

**Reversing Systems.** Reversing Systems of Large Marine Oil Engines, V. Holmes. Inst. Mar. Engrs.—Trans., Dec. 1923, pp. 432-456 and (discussion) 456-467, 19 figs. Notes on types of four-stroke and two-stroke reversing systems.

**Solid-Injection.** Observations on the Solid-Injection Engine, P. H. Schweitzer. Power, vol. 59, no. 3, Jan. 15, 1924, pp. 90-91. Writer believes a flatter combustion line would be desirable, provided it would not lead to after-burning; better control of fuel injection as to spray action and accurate delivery in quantity and timing might lead to this end.

**Torsiongrams and Vibrograms of.** Torsiongrams and Vibrograms of Oil Engines. Motorship, vol. 9, no. 1, Jan. 1924, pp. 28-31, 45 figs. Simple instruments facilitate exploration of machinery for critical periodic stresses.

Manufactured by  
Advertisers**CLASSIFIED LIST OF MECHANICAL EQUIPMENT**Alphabetical List  
on page 156

**Punches and Dies**  
\* Roversford Fdry. & Mach. Co.

**Punching and Coping Machines**  
\* Long & Allstatter Co.

**Punching and Shearing Machines**  
\* Long & Allstatter Co.  
\* Roversford Fdry. & Mach. Co.

**Purifiers, Ammonia**  
\* Frick Co. (Inc.)

**Rope, Hoisting**  
Clyde Iron Works Sales Co.  
\* Roebbing's, John A. Sons Co.

**Rope, Transmission**  
Link-Belt Co.  
\* Roebbing's, John A. Sons Co.

**Rope, Wire**  
Clyde Iron Works Sales Co.  
\* Roebbing's, John A. Sons Co.

**Rubber Goods, Mechanical**  
\* Goodrich, B. F. Rubber Co.  
\* Jenkins Bros.  
\* United States Rubber Co.

**Rubber Mill Machinery**  
Farrel Foundry & Machine Co.

**Sand Blast Apparatus**  
\* De La Vergne Machine Co.

**Saw Mill Machinery**  
\* Allis-Chalmers Mfg. Co.

**Saw Mills, Portable**  
\* Frick Co. (Inc.)

**Scales, Fluid Pressure**  
\* Crosby Steam Gage & Valve Co.

**Screens, Perforated Metal**  
\* Hendrick Mfg. Co.

**Screens, Revolving**  
\* Allis-Chalmers Mfg. Co.  
Chain Belt Co.  
\* Gifford-Wood Co.  
\* Hendrick Mfg. Co.  
Link-Belt Co.  
\* Smith, F. L. & Co.

**Screens, Shaking**  
\* Allis-Chalmers Mfg. Co.  
Chain Belt Co.  
\* Gifford-Wood Co.  
\* Hendrick Mfg. Co.  
Link-Belt Co.

**Screens, Water Intake (Traveling)**  
Chain Belt Co.  
Link-Belt Co.

**Screw Cutting Dies**  
(See Dies, Thread Cutting)

**Screw Machines, Hand**  
\* Jones & Lamson Mch. Co.  
\* Warner & Swasey Co.

**Screws, Cap**  
\* Scovill Mfg. Co.

**Screws, Safety Set**  
Allen Mfg. Co.  
\* Bristol Co.

**Screws, Set**  
Allen Mfg. Co.

**Separators, Ammonia**  
\* De La Vergne Machine Co.  
Elliott Co.  
\* Frick Co. (Inc.)  
\* Vogt, Henry Machine Co.

**Separators, Oil**  
\* Crane Co.  
\* De La Vergne Machine Co.  
Elliott Co.  
\* H. S. B. W.-Cochrane Corp'n  
\* Hoppes Mfg. Co.  
\* Kieley & Mueller (Inc.)  
\* Vogt, Henry Machine Co.

**Separators, Steam**  
\* Crane Co.  
Elliott Co.  
\* H. S. B. W.-Cochrane Corp'n  
\* Hoppes Mfg. Co.  
\* Kieley & Mueller (Inc.)  
\* Pittsburgh Valve, Fdry. & Const. Co.  
\* Vogt, Henry Machine Co.

**Shafting**  
\* Allis-Chalmers Mfg. Co.  
\* Brown, A. & F. Co.  
Cumberland Steel Co.  
\* Falls Clutch & Machinery Co.  
\* Medart Co.  
Union Drawn Steel Co.  
\* Wood's, T. B. Sons Co.

**Shafting, Cold Drawn**  
\* Medart Co.

**Shafting, Flexible**  
\* Gwilliam Co.

**Shafting, Turned and Polished**  
Cumberland Steel Co.  
Link-Belt Co.

**Shapes, Brick**  
\* McLeod & Henry Co.

**Shapes, Cold Drawn Steel**  
Boston Pressed Metal Co.  
Union Drawn Steel Co.

**Shapes, Steel, Pressed**  
Boston Pressed Metal Co.

**Shears, Alligator**  
Farrel Foundry & Machine Co.  
\* Long & Allstatter Co.  
\* Roversford Foundry & Machine Co.

**Shears, Hydraulic**  
Mackintosh-Hemphill Co.

**Shears, Plate**  
\* Long & Allstatter Co.  
Mackintosh-Hemphill Co.

**Shears, Rotary**  
\* Niagara Machine & Tool Works

**Sheaves, Rope**  
\* Brown, A. & F. Co.  
Clyde Iron Works Sales Co.  
\* Falls Clutch & Machinery Co.  
\* Jones, W. A. Fdry. & Mach. Co.  
Link-Belt Co.  
Mackintosh-Hemphill Co.  
\* Medart Co.  
\* Nordberg Mfg. Co.  
\* Wood's, T. B. Sons Co.

**Sheet Metal Work**  
\* Allington & Curtis Mfg. Co.  
\* Geuder, Paeschke & Frey Co.  
\* Hendrick Mfg. Co.

**Sheet Metal Working Machinery**  
Farrel Foundry & Machine Co.  
\* Niagara Machine & Tool Works

**Sheets, Brass**  
\* Scovill Mfg. Co.

**Sheets, Bronze**  
\* Hendrick Mfg. Co.

**Sheets, Rubber, Hard**  
\* Goodrich, B. F. Rubber Co.  
\* United States Rubber Co.

**Shelving, Metal**  
Manufacturing Equip. & Engrg. Co.

**Silencers, Engine**  
\* Geuder, Paeschke & Frey Co.

**Siphons (Steam-Jet)**  
\* Schutte & Koerting Co.

**Slide Rules**  
Dietzgen, Eugene Co.  
Electro Sun Co. (Inc.)  
Keuffel & Esser Co.  
New York Blue Print Paper Co.  
Parvell Laboratories  
U. S. Blue Co.  
Weber, F. Co. (Inc.)

**Smoke Recorders**  
\* Sarco Co. (Inc.)

**Smoke Stacks and Flues**  
(See Stacks, Steel)

**Sockets, Wire Rope**  
(See Wire Rope Fastenings)

**Soot Blowing Systems**  
Diamond Power Specialty Corp'n

**Space Heaters**  
Westinghouse Elect. & Mfg. Co.

**Special Machinery**  
\* American Machine & Foundry Co.  
\* Brown, A. & F. Co.  
\* Builders Iron Foundry  
\* Cramp, Wm. & Sons Ship & Engine Bldg. Co.  
DuPont Engineering Co.  
Farrel Foundry & Machine Co.  
\* Fawcett Machine Co.  
\* Franklin Machine Co.  
Lammert & Mann Co.  
Mackintosh-Hemphill Co.  
\* Nordberg Mfg. Co.  
Purvis Machine Co.  
\* Smith, F. L. & Co.  
\* Vilter Mfg. Co.

**Speed Reducing Transmissions**  
\* Cleveland Worm & Gear Co.  
\* De Laval Steam Turbine Co.  
\* General Electric Co.  
\* James, D. O. Mfg. Co.  
\* Jones, W. A. Fdry. & Mach. Co.  
Link-Belt Co.

**Spinning, Metal**  
\* Geuder, Paeschke & Frey Co.

**Spray Cooling Systems**  
\* Cooling Tower Co. (Inc.)  
\* Spray Engineering Co.

**Sprays, Water**  
\* Cooling Tower Co. (Inc.)  
\* Spray Engineering Co.

**Sprinklers, Spray**  
\* Cooling Tower Co. (Inc.)  
\* Spray Engineering Co.

**Sprockets**  
\* Baldwin Chain & Mfg. Co.  
\* Fuller-Lehigh Co.  
\* Gifford-Wood Co.  
Link-Belt Co.  
\* Medart Co.  
Philadelphia Gear Works

**Stacks, Steel**  
\* Bigelow Co.  
\* Brownell Co.  
\* Casey-Hedges Co.  
\* Cole, R. D. Mfg. Co.  
\* Hendrick Mfg. Co.  
\* Morrison Boiler Co.  
\* Titusville Iron Works Co.  
\* Union Iron Works  
\* Vogt, Henry Machine Co.  
\* Walsh & Weidner Boiler Co.

**Stair Treads**  
\* Irving Iron Works Co.

**Stampings, Sheet Metal**  
Boston Pressed Metal Co.  
\* Geuder, Paeschke & Frey Co.

**Standpipes**  
\* Cole, R. D. Mfg. Co.  
\* Morrison Boiler Co.  
\* Walsh & Weidner Boiler Co.

**Standpipes, Concrete**  
Heine Chimney Co.

**Static Condensers**  
\* Westinghouse Elect. & Mfg. Co.

**Steam Specialties**  
\* Crane Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**OIL FUEL**

**Efficient Use.** Efficient Use of Liquid Fuel, H. A. Anderson. Foundry, vol. 52, no. 1, Jan. 1, 1924, pp. 29-30. Type of burners and amounts of air and oil pressure influence economical application of fuel oil; use of insulating brick and grade of fuel contributing factors.

**OXY-ACETYLENE WELDING**

**Locomotive Repair Shops.** Welding in Locomotive Repair Shops, F. E. Rogers. Welding Engr., vol. 8, no. 12, Dec. 1923, pp. 19-24, 19 figs. Particulars regarding the various oxy-acetylene welding operations employed in locomotive repair shops. Paper presented at Chattanooga Regional Mtg. of Southern Local Section of A.S.M.E.

**P****PACKINGS**

**Leather.** Types of Leather Packings—Their Care and Use, R. C. Moore. Belting, vol. 23, no. 6, Dec. 1923, pp. 44, 46 and 48, 12 figs. Describes most common forms; four dimensions indicate complete size; correct and incorrect installations.

**PIPE, STEEL**

**Bending.** Pipe Bending by Machinery, C. R. H. Bonn. Machy. (Lond.), vol. 23, nos. 584, 585 and 587, Dec. 6, 13 and 27, 1923, pp. 313-315, 333-334 and 418-421, 43 figs. Points out advantages and disadvantages of cold bending by machines, and discusses conditions which must be fulfilled by ideal pipe-bending machine.

**PRESSES**

**Safety Appliances.** Modern Safety Devices for Plate and Metalworking Machines (Neuzeitliche Unfallschutzvorrichtungen an Blech- und Metallbearbeitungsmaschinen), A. Herb. Maschinenbau, vol. 3, no. 2, Oct. 25, 1923, pp. G7-G10, 5 figs. Points out need of protective devices for presses, shears, etc.; and describes design and operation of some of these devices.

**FRESSWORK**

**Door-Knob Manufacture.** Manufacture of Pressed Metal Door Knobs, Emil Panek. Forging—Stamping—Heat Treating, vol. 9, no. 12, Dec. 1923, pp. 513-514, 9 figs. Various operations entering into manufacture; novel method used for assembling stamped parts.

**PRODUCER GAS**

**Waste Wood as Source.** Gasification Plants for Waste Products, Eng. Progress, vol. 4, no. 11, Nov. 1923, pp. 229-231, 3 figs. Describes wood gasification plants constructed by Motorenfabrik Deutz with idea of producing valuable tar oil besides generating power.

**PSYCHOLOGICAL TESTS**

**Adaptability Tests.** Adaptability Tests for Apprentices of the Metal Industry in the Psychotechnical Institute of the Dresden Technical College (Eignungsprüfungen an Lehrlingen der Metallindustrie im Psychotechnischen Institut und der T. H. zu Dresden), W. Blumenfeld. Maschinenbau, vol. 2, no. 22, Aug. 8, 1923, pp. B249-B253, 15 figs. Discusses devices and tests introduced for determination of adaptability of apprentices, and results of tests. See also following articles in same issue: Psychotechnical Adaptability Tests of Firm of A. Borsig, Tegel-Berlin, H. Hildebrandt, pp. B254-B256, 3 figs.; The Execution of Adaptability Tests, H. Rupp, pp. B256-B259; Psychotechnology in the Service of Factory Rationalization, H. Moede, pp. B259-B261; Applied Psychology and Its Importance for Training of Engineers, pp. B261-B262.

**Testing Device.** A Device for Testing of Reaction, Attentiveness and Concentration (Eine Anordnung zur Prüfung von Reaktion, Verteilung der Aufmerksamkeit und Konzentration), Maschinenbau, vol. 2, no. 22, Aug. 8, 1923, pp. B262-B264, 3 figs. Describes design and use of arrangement for testing adaptability of workers in engineering branches, such as crane drivers, switchboard operators in large electricity works, and for drivers of automobiles, street and railway cars, etc.

**PULLEYS**

**Standards.** Practical Application of Standards for Pulleys (Einführung der Riemenscheibennormen in die Praxis), W. Patzke. Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. B28-B31, 7 figs. Purposes of pulley standardization; introduction of standards; examples from practice at Wulff Steel Works; influence of workshop tolerances on accuracy of speeds; faults of described system are said to be few in comparison with advantages.

**PULVERIZED COAL**

**Boiler Firing.** Application of Pulverized Coal to Boilers, Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 71-72, 2 figs. Preparation of fuel; storage of dry pulverized coal; importance of furnace design; ash removal facilitated by water screens; safety rules.

**Chemical Works.** Fuel Economy in Chemical Works, H. W. Hollands and C. Elliott. Chem. Trade J. & Chem. Engr., vol. 73, no. 1910, Dec. 28, 1923, pp. 761-763, 6 figs. Deals with expenditure, coal, and efficient combustion of coal, and examines possibilities of employing pulverized fuel firing, in light of experience that is now available.

**Developments.** Developments in the Use of Pulverized Coal, Chas. Longenecker. Power Plant Eng., vol. 28, no. 2, Jan. 15, 1924, pp. 127-130, 2 figs. Many

installations have shown that pulverized coal can be burned with high degree of efficiency.

**Locomotive Firing.** Pulverized-Coal Firing for Locomotives (Zur Frage der Brennstaubfeuerung für Lokomotiven), H. de Grahl. Glaser's Annalen, vol. 93, no. 11, Dec. 1, 1923, pp. 119-126, 22 figs. Advantages and disadvantages of pulverized-coal firing; suggestions for improvements in pulverizing fuel and durability of construction material.

**Power Plants.** Tests of a Powdered-Coal Plant, H. Kreisinger, J. Blizard, C. E. Augustine and B. J. Cross. U. S. Bur. Mines, Technical Paper 316, 1923, 22 pp., 10 figs. Report of investigations at power plant of St. Joseph Lead Co., Rivermines, Mo.; tests comprised 2 boiler tests, 6 dryer tests, and 8 mill tests.

**Pulverizers.** A British Unit Pulverizer for Coal and Other Materials, Power Engr., vol. 19, no. 214, Jan. 1924, p. 16, 2 figs. Features of design of Vickers-Griffin self-contained coal pulverizer, which enables small users of coal to adopt powdered-fuel firing economically.

**Utilization, Germany.** The Status of Pulverized-Coal Firing in Germany (Stand der Kohlenstaubfeuerung in Deutschland), G. Bulle. Wärme, vol. 46, no. 19, May 11, 1923, pp. 199-202, 7 figs. Field of application; technical features of pulverized-coal furnaces, practical results and conclusions.

**PUMPING PLANTS**

**Diesel-Driven.** A Novel Diesel Pumping Plant, F. J. Dixon. Power Engr., vol. 19, no. 214, Jan. 1924, pp. 23-24, 1 fig. Diesel-driven combination of borehole- and force-pump, without reservoir, erected at Somerford by So. Staffordshire Waterworks Co.

**Mines.** Features That Should be Embodied in the Design of Plunger and Centrifugal Pumps, Coal Age, vol. 25, no. 1, Jan. 3, 1924, pp. 11-14, 3 figs. Mining Congress committee suggest standards which should govern construction of pumps in coal mines, not for gathering water but for its delivery to surface.

**Steam vs. Diesel-Driven.** Comparative Running Costs of Steam and Diesel Driven Pumping Plants, K. B. Woodd Smith. Diesel Engine Users Assn.—paper read at meeting Oct. 5, 1923, 17 pp. (including discussion), 1 fig. Comparison shows economies to be effected by substitution of Diesel for Steam-driven pumps in water works where pumping is continuous throughout 24 hr.

**PUMPS**

**Slippage Determination.** A Simple Method of Determining Pump Slippage, J. E. Pierce. Eng. & Contracting (Water Works), vol. 60, no. 6, Dec. 12, 1923, pp. 1226-1227, 2 figs. Describes method used in determining slippage of one of the main pumps of Roanoke Water Works Co., Roanoke, Va.; instruments used were Pitot tube, manometer and counter of engines.

**Sugar Factories.** Sugar Factory Pumps P. H. Parr. Int. Sugar J., vol. 25, no. 298, Oct. 1923, pp. 527-530. Discussion of different types of pumps suitable for sugar factories; tables giving average net capacities for the various standard sizes of pumps.

**PUMPS, CENTRIFUGAL**

**Installation.** Installation of Centrifugal Pumps, J. Roobloom. Ariz. Min. J., vol. 7, no. 14, Dec. 15, 1923, pp. 7-8 and 46, 8 figs. Discusses correct and incorrect methods of attaching suction piping.

**Turbine-Driven.** A Steam Turbine Waterworks Set, Power Engr., vol. 19, no. 214, Jan. 1924, pp. 17-19, 2 figs. Describes plant erected to meet special circumstances at Oakfield Road pumping station, Clifton.

**PYROMETERS**

**Optical, Smoked Glasses in.** The Use of Smoked Glasses in Optical Pyrometrical Measurements (Ueber den Gebrauch von Rauchgläsern bei optisch-pyrometrischen Messungen), F. Hoffmann. Zeit. für Physik, vol. 17, no. 1, July 30, 1923, pp. 1-22, 6 figs. Works out corrections in case of two Jena smoked glasses Nos. F3815 and F7839 in combination with Jena red filter F4512 when used in Holborn-Kurlbaum pyrometer.

**R****RAILLESS TRACTION**

**France.** Trackless Trolley System in France (La ligne d'omnibus électriques à trolley de Modane à Lanslebourg), A. Chardin. Revue Générale de l'Electricité, vol. 14, no. 23, Dec. 8, 1923, pp. 917-923, 7 figs. Traction system installed near Italian frontier in France; line is 15 mi. long with 1100-ft. elevation difference between start and finish; two 75-kw. substations transform and rectify 10,000-volt, 3-phase current into 550-volt d. c.; present rolling stock comprises three passenger cars and three 3-ton trucks, each car having two 16-kw. motors; average speed is 13 mi. per hr.

**RAILS**

**Bonds, Welding of.** Welded Rail Bonds, H. H. Febrey. Am. Welding Soc.—J., vol. 2, no. 12, Dec. 1923, pp. 18-24, 4 figs. Discusses flame weld bonds and arc weld bonds.

**Low-Carbon.** Low Carbon Rails Show Less Transverse Fissures, C. W. Gennet, Jr. Ry. Age, vol. 76, no. 2, Jan. 12, 1924, p. 186, 1 fig. Results of tests show that tendency for fissures to develop increases with carbon content of steel.

**Transverse Fissures.** Study of Transverse Fissures Broadened Ry. Age, vol. 75, no. 25, Dec. 22, 1923, p. 1169. Bur. of Standards and Interstate Commerce Commission join roads and mills in investigations.

**RAILWAY CONSTRUCTION**

**Ontario.** Recent Developments on the Temiskaming and Northern Ontario Railway, S. B. Clement. Eng. J., vol. 7, no. 1, Jan. 1924, pp. 12-20, 12 figs. Development of Northern Ontario and its natural resources with extension of railway. See also Contract Rec. & Eng. Rev., vol. 37, no. 49, Dec. 5, 1923, pp. 1145-1148, 2 figs.

**RAILWAY ELECTRIFICATION**

**Mexico.** The Electrification of the Mexican Railway, Elec. Rev., vol. 93, no. 2404, Dec. 21, 1923, pp. 926-929, 4 figs. Deals with first section, from Esperanza to Orizaba.

**RAILWAY MOTOR CARS**

**Benzol.** Benzol Rail Cars (Benzolmechanische Eisenbahn-Triebwagen), H. Johannsen. Verkehrstechnik, vol. 40, no. 46-47, Nov. 23, 1923, pp. 409-411, 2 figs. Gives results of trial runs of railway motor cars built by Deutsche Werke A.-G., described in previous issue of same journal.

**Development.** Development of Railroad Motor Car. Eng. & Contracting (Railways), vol. 60, no. 6, Dec. 19, 1923, pp. 1304-1306. Present practice and requirements for gasoline and gasoline-electric driven cars on rails. Appendix to report of special committee of U. S. Chamber of Commerce.

**RAILWAY OPERATION**

**Running of Trains.** Determination of Graphical Determination of Running of Trains, C. Fiala. Int. Ry. Congress Assn.—Bul., vol. 5, no. 12, Dec. 1923, pp. 1081-1086, 5 figs. Calculations of moving of a train. From Journal of Soc. of Czecho-Slovakian Engrs. & Architects, Technicky Obzor, 1922.

**Statistics, 1923.** Railway Statistics for Nineteen Twenty-three, J. H. Parmelee. Ry. Age, vol. 76, no. 1, Jan. 5, 1924, pp. 46-49, 3 figs. Summary of achievement; new equipment; record freight traffic; operating efficiency; financial results; operating revenues; employees and their wages.

**Train Control.** Automatic Train Control Installation Completed, Ry. Rev., vol. 73, no. 25, Dec. 22, 1923, pp. 899-904, 8 figs. Chicago Rock Island & Pac. is first railroad to complete installation; outline of method of operation under system as installed.

**Rock Island Places Train Control in Service.** Ry. Age, vol. 75, no. 25, Dec. 22, 1923, pp. 1145-1149, 5 figs. Installation is first to be inspected by Interstate Commerce Commission under order; system of Regan Safety Devices Co., as used on this installation, is intermittent ramp contact type, with speed control.

**RAILWAY REPAIR SHOPS**

**Car Repairing.** Car Repair Contest, Delaware & Hudson Co., Ry. Rev., vol. 73, no. 25, Dec. 22, 1923, pp. 891-894, 3 figs. Five teams of car repairers compete on time basis in rebuilding composite hopper cars.

**Locomotive.** Classification of Locomotive Repair Shops, Geo. Armstrong. Ry. Mech. Engr., vol. 98, no. 1, Jan. 1924, pp. 41-46, 3 figs. Analysis of shop operations with object of reducing expenses and facilitating repairs.

**Erie Completes Modern Addition to Hornell Shop.** Ry. Age, vol. 76, no. 2, Jan. 12, 1924, pp. 181-185, 10 figs. Gap crane of 250 tons capacity comprises interesting feature of development.

**RAILWAY SHOPS**

**Waste-Renovating Plant.** Waste Renovating Plant at Beech Grove, Ind. Ry. Rev., vol. 73, no. 26, Dec. 29, 1923, pp. 931-935, 10 figs. Description of plant for reclaiming journal-box packing and process employed under a contract on output basis with Cleveland Cincinnati Chicago & St. Louis Ry.

**RAILWAY SIGNALING**

**Construction, 1923.** Signal Construction Shows Marked Increase, K. E. Kellenberger. Ry. Age, vol. 76, no. 1, Jan. 5, 1924, pp. 59-68. Remote-control switch installations grow in favor of proposed for 1924; statistics on automatic block signals and interlocking plants installed in 1923.

**Signals, Types of.** Railway Signaling, C. W. Parker. Can. Ry. Club—Proc., vol. 22, no. 8, Nov. 1923, pp. 21-26 and (discussion) 26-30. Deals with signals for path or track on which train has to travel, consisting generally as follows: "Stop," "Caution" or "Proceed;" different types.

**RAILWAY TRACK**

**Rail-Conveying Machine.** Platelaying with the Anderson Rail Conveyor, Ry. Gaz., vol. 39, no. 23, Dec. 7, 1923, pp. 719-721, 5 figs. Account of track-laying work carried out on Bengal-Nagpur Ry. in India with aid of a simple machine invented by A. T. D. Anderson, Assistant Engr., Bengal-Nagpur Ry., and description of machine.

**RAILWAYS**

**Economics.** Some Fundamentals in Transportation Economics, N. D. Ballantine. St. Louis Ry. Club—Proc., vol. 28, no. 8, Dec. 14, 1923, pp. 160-168.

**Water Supply.** Railroad Water Supply, E. F. Mason. Central Ry. Club—Proc., vol. 31, no. 5, Nov. 1923, pp. 1431-1436 and (discussion) 1436-1453. Sources of supply, and treatment of waters for use in locomotives; water storage; upkeep and maintenance of pumps; etc.

**REFRACTORIES**

**Electric Furnaces.** Electric Furnace Refractories, R. C. Gosrow. Chem. & Met. Eng., vol. 29, no. 27, Dec. 31, 1923, pp. 1181-1185. Practical suggestions for construction of lining walls, hearths and roofs that will enable electric-furnace operator to obtain maximum refractory service.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**REFRIGERANTS**

**Ethyl Chloride.** Thermal Properties of Ethyl Chloride. Cold Storage, vol. 26, no. 309, Dec. 20, 1923, pp. 456-458, 1 fig. Food Investigation Board on C. F. Jenkin's experiments.

**REFRIGERATING MACHINES**

**CO<sub>2</sub> Compressors.** Ten-Ton Refrigerating CO<sub>2</sub> Compressor. Engineering, vol. 116, no. 3024, Dec. 14, 1923, p. 738, 1 fig. Machine is of twin-cylinder, single-acting vertical type, with capacity of 10 tons of refrigeration per 24 hr. and is driven by 20-h.p. electric motor which runs at 400 to 500 r.p.m.

**REFRIGERATING PLANTS**

**Condensers and Brine Coolers.** Condensers and Brine Coolers. J. C. Goosmann. Ice & Refrigeration, vol. 65, nos. 1, 2, 3, 4 and 5, July, Aug., Sept., Oct. and Nov. 1923, pp. 13-15, 74-76, 133-134, 195-197 and 259-262, 9 figs. Their characteristics, temperature differences and ranges, coefficients of heat transfer, and surface requirements; steam condensers; double-pipe coolers and condensers; speeds of media; mean temperature difference; CO<sub>2</sub> condensers; pressure-heat-content diagram for CO<sub>2</sub>; Mollier diagram; research on CO<sub>2</sub> properties; total condenser work in B.t.u.

**REFRIGERATION**

**Ammonia Charts.** Refrigeration and the Ammonia Chart. David L. Fiske. Ice & Refrigeration, vol. 65, nos. 4, 5 and 6, Oct., Nov. and Dec. 1923, pp. 204-206, 265-267 and 363-365, 11 figs. Describes capacities and efficiencies of refrigeration systems; cycles of operation with different condenser and evaporation pressures; coefficients of performances; wet and dry compression; constants of cycles; theoretical and practical considerations; clearance in compressors; calculation of compressors with and without clearance; excessive clearance; test data on effect of clearance.

**RESEARCH**

**Industrial.** The Function and Scope of Industrial Research. A. R. M. Fleming. Indus. Management (Lond.), vol. 10, no. 13, Dec. 27, 1923, pp. 356-357. Abridgment of paper read at Regent Street Polytechnic (Lond.), under auspices of Industrial League and Council.

**Nat. Research Council, Work of.** Work of the National Research Council, Vernon Kellogg. Science, vol. 58, nos. 1505 and 1506, Nov. 2 and 9, 1923, pp. 337-341 and 362-366. Statement of activities for year July 1, 1922—June 30, 1923. See also Nat. Research Council, Reprint & Circular Series, No. 49, 1923, 16 pp.

**ROLLING MILLS**

**Sheet Mills.** Detroit's New Automobile Sheet Plant. Iron Age, vol. 113, no. 1, Jan. 3, 1924, pp. 50-53, 8 figs. Features of works of Michigan Steel Corp. include short hauls to and from rolls and quick drying of washed sheets.

**S****SAND, MOLDING**

**Foundry Problems.** Molding Sand Problem in the Foundry. Eugene W. Smith. Iron Age, vol. 113, no. 4, Jan. 24, 1924, pp. 299 and 340-341. Important bearing of varying physical characteristics; vibratory test as dependable method for determining them.

**Preparation and Testing.** The Preparation and Testing of Moulding and Core Sands. E. M. Currie. Foundry Trade J., vol. 28, no. 382, Dec. 13, 1923, pp. 498-500, 5 figs. Chemical aspect of sand; mechanical testing; mixing; tempering; sharp sand and binders; oil sand mixers.

**SCREW THREADS**

**Standards.** The New Screw Thread Standard. Ralph E. Flanders. Am. Mach., vol. 59, nos. 5, 9, 12, 14, 16 and 26, Aug. 2, 30, Sept. 20, Oct. 4, 18 and Dec. 27, 1923, pp. 167-169, 327-328, 441-442, 501-506, 589-590 and 939-942, 10 figs. History of National Screw Thread Commission and A.E.S.C. sectional committee; terminology and definitions from report; explanation of various terms used; considerations affecting clearances and methods of gaging. Fine- and coarse-thread series; elimination of unnecessary threads. Condensed tables of dimensions for different classes of fits; fine and coarse threads; numbered and fractional sizes. Principles employed in specifying tolerances. Provisions for special threads and fits in Screw Thread Report of A.E.S.C. tables and charts showing tolerances.

**SCREWS**

**Wood, Cold Heading of.** The Cold Heading of Wood Screws. A. K. Hamer. Forging—Stamping—Heat Treating, vol. 9, no. 12, Dec. 1923, pp. 511-512, 6 figs. Advantage and disadvantage of basic and Bessemer wires; carbon steel 0.90 to 1.00 per cent superior to alloy steel for header dies using special design fixture.

**SEAPLANES**

**Landing Base.** A Seaplane Base for Commercial Air Transport. E. D. Osborn. Aviation, vol. 16, no. 5, Feb. 4, 1924, pp. 123-124. Describes commercial seaplane base located in Florida from which F5L twin Liberty flying boats, converted to carry 10 passengers, were operated for period of over three years.

**SHAFTS**

**Foundation Vibrations, Influence of.** The Influence of Foundations on the Critical Behavior of High-Speed Shafts (Die Einwirkung des Fundaments auf das kritische Verhalten raschumlaufender Wellen). V. Blaess. Maschinenbau, vol. 2, no. 25-26, Sept. 29,

1923, pp. B281-B283, 3 figs. Numerical investigation. See also article by H. Gerb, entitled, The Transmission of Machine-Foundation Vibrations in the Earth, pp. B283-B284.

**SHEET-METAL WORKING**

**Scientific Aspects.** Science for the Sheet Metal Worker. Thos. Newton. Sheet Metal Worker, vol. 14, nos. 7, 9, 13, 17, 19, 21 and 24, Apr. 27, May 25, July 20, Sept. 14, Oct. 12, Nov. 9 and Dec. 21, 1923, pp. 251-252 and 276, 330-332, 493-494, 646-647 and 697, 719-720, 789 and 816, and 899-900 and 925, 3 figs. Deals with chemistry; physics and metallurgy. Matter; physical and chemical changes; chemical affinity; elements; compounds; chemical action; influence of heat and light; etching of copper and brass; hydrogen and its properties; water gas; oxygen; ozone; combustibles and supporters of combustion; atomic theory; chemical symbols and formulas; etc.

**SMOKE ABATEMENT**

**Methods.** Smoke Abatement. O. Monnett. U. S. Bur. Mines, Technical Paper 273, 1923, 31 pp., 18 figs. partly on supp. plates. Determination of atmospheric impurities; composition of pure air; nature of atmospheric pollution; effect of atmospheric pollution upon health, vegetation, and property; possibilities of smoke abatement; domestic smoke problem; industrial smoke; locomotive smoke; smoke ordinances.

**SPEED INDICATORS**

**Stroboscopic.** The Stroboscopic Speed Indicator. Practical Engr., vol. 67, no. 1874, Jan. 25, 1923, pp. 49-50, 3 figs. Describes Crompton-Robertson stroboscopic vibrator having two similar vibrating bars clamped to base, and electromagnet arranged so that it can set bars in state of vibration.

**SPRINGS**

**Automobile.** New Springs for Automobiles (Neue Federung für Kraftwagen). Ad. König. Motorwagen, vol. 26, nos. 29-30 and 32-33, Oct. 20-31 and Nov. 20-30, 1923, pp. 436-437 and 464-466, 6 figs. Points out shortcomings of automobile springs commonly used; and describes new system of springs and chassis developed by firm of Sörg & Sabeck.

**STANDARDIZATION**

**Germany.** An Example of Standardization in German Industry. G. Leifer and H. Goller. Mech. Engr., vol. 46, no. 1, Jan. 24, 1924, pp. 54-55, 3 figs. Notes on manner in which standardization is practiced in the "Wernerwerk," a Siemens & Halske factory employing 18,000 men and producing electrical machinery, illustrating very close cooperation existing between German industry and the German Industrial Standards Committee (DIN).

**Live Spindles of Machine Tools.** The Standardization of Threaded Machine-Tool Spindles (Die Normung der Spindelköpfe mit Gewinde). Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. B24-B25, 40 figs. Decision of Standard Committee of Assn. German Machine-Tool Builders.

**STANDARDS**

**German N. D. I. Reports.** Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 2, no. 21, July 26, 1923, pp. N140-N150, 11 figs. Proposals for standards of tangential grooves, drive, flat, hollow and gib-headed keys, gib-headed flat and hollow keys, hexagonal bolts with point, etc.

Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 2, no. 24, Sept. 15, 1923, pp. N167-N174, 10 figs. Proposals for standards of solid and split adjustable spring collars for setting screws with Whitworth and metric thread.

Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 2, no. 25-26, Sept. 29, 1923, pp. N175-N182, 2 figs. Proposed standards for metal circular saws and slot cutters, low-carbon-steel pipes for pipe lines and for stationary, locomotive and marine boilers; low carbon-steel pipes and molds welded in water-gas and coke firing; Whitworth pipe threads for fittings.

Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 3, no. 3, Nov. 8, 1923, pp. N9-N18, 20 figs. Proposals for standards of hexagonal steel and iron, flat drawn steel, hollow flat steel, and cutting steels. Proposed standards for overhead countershafts, hand chisel and cutting steels.

Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. N19-N24, 6 figs. Proposals for indicator cocks. Proposed standards for bushes, ball bearings, indicator screw plugs, open d. c. generators, transformers, gear transmissions for standardized electric motors, clamps and slip rings for electric machines, etc.

**STEAM**

**High-Pressure.** Investigations of the Properties of Steam at High Pressures (Die bisherigen Forschungen über die Eigenschaften des Wasserdampfes bei hohen Spannungen). H. Schmolke. Wärme, vol. 46, no. 23, June 8, 1923, pp. 243-246, 1 fig. Compares values of heat of evaporation and volume of saturation at high pressures found by Schüle and Eichelberg by means of extrapolation, and shows advantages of German research over English works in same field.

**Maximum Steam Pressure, and Economical Power Supply.** (Höchstdruck und Energiewirtschaft). H. Gleichmann. Zeit. des Vereins deutscher Ingenieure, vol. 67, no. 52, Dec. 29, 1923, pp. 1159-1162, 6 figs. Points out that efficiency and saving in coal are obtained by increase of pressure and superheat; effect on different manufacturing branches

with special regard to delivery of excess current to public distribution systems.

**STEAM ENGINES**

**Lubrication.** Reciprocating Steam Engines. Lubrication, vol. 9, no. 11, Nov. 1923, pp. 122-128, 6 figs. Details in connection with internal and external lubrication.

**Marine Valve Gears for.** Valve Gears for Marine Steam Engines (Ventilsteuerungen für Schiffs-Kolbendampfmaschinen). K. Trautner. Schiffbau, vol. 25, nos. 4, 5 and 6, Nov. 28, Dec. 12 and 26, 1923, pp. 75-79, 102-106 and 129-133, 13 figs. Describes development and types of marine steam engines with poppet valve gear; determination of valve conditions and force of spring; discusses several types, including Kug gear in wide use for engines of fishing vessels; time-acceleration curves. Bibliography.

**Types and Selection.** The Control of Power Production. Chas. L. Hubbard. Factory, vol. 31, no. 6, Dec. 1923, pp. 750-754 and 788, 10 figs. Steam-engine types and their selection.

**Uniflow.** Action of Uniflow Engine Governor Eccentrics. W. Turnwald. Power, vol. 59, no. 3, Jan. 15, 1924, pp. 94-96, 8 figs. Effect of excessive lead at light loads; types of governor eccentrics and influence on lead; variation of lead with change in cut-off.

**STEAM PIPES**

**Insulation.** The Influence of Steam Utilization on the Most Economical Strength of Insulation (Der Einfluss der Dampfverwertung auf die wirtschaftlichste Isolierstärke). J. S. Cammerer. Archiv für Wärme-wirtschaft, vol. 4, no. 11, Nov. 1923, pp. 197-200, 1 fig. Discusses methods of measuring heat insulation of pipe lines.

**STEAM POWER PLANTS**

**Economy.** Economics of Plant Management and the Choice of Fuel. W. Polakov. Nat. Engr., vol. 27, no. 12, Dec. 1923, pp. 588-591, 6 figs. Factors affecting efficiency; data on what can be accomplished by modern methods in average plant.

**Mercury Vapor-Steam System.** Binary Fluid System Using Mercury Vapor Expected to Cut Power Costs. P. M. Heldt. Automotive Industries, vol. 50, no. 1, Jan. 3, 1924, pp. 20-21. Gen. Elec. Co. responsible for development of new method which bids fair to result in more economical utilization of fuel; efficiency obtained by recovering some of latent heat.

**Process Steam.** Process Steam as a Power Plant Product. Miles Sampson. Textile World, vol. 65, no. 1, Jan. 5, 1924, pp. 81-82 and 85, 3 figs. Points out that in mill finishing its own goods, process steam may become principal product of power plant; factors in problem of maintaining adequate steam supply at pressures demanded and economically balancing this load with power requirements.

**STEAM TURBINES**

**Blades.** Steam Turbine Blading. J. C. Read. Instn. Elec. Engrs.—Jl., vol. 61, no. 323, Oct. 1923, pp. 1109-1114, 5 figs. Review of present position. Deals with causes and effects of corrosion and erosion; form of blade passage in impulse and reaction machines, and energy losses occurring in blading; methods of tapering blades; details of stresses; types of blade fastenings, lacing and shrouding; methods used for obtaining large exhaust area; vibration and its causes; method of correcting for effect of centrifugal force; methods of manufacture by milling and drop forging.

**Control, Hydraulic Relay for.** Turbine Controlled by Temperature or Pressure. Power Plant Engr., vol. 28, no. 2, Jan. 15, 1924, pp. 162-163, 2 figs. Describes hydraulic relay device which will transmit impulses from thermostat or pressure diagram to distance and at same time magnify power of these impulses so that they will control turbine governor with positiveness.

**Impulse and Reaction.** Impulse and Reaction in Steam Turbines. F. P. Hodgkinson. Power, vol. 59, no. 5, Jan. 29, 1924, pp. 174-175, 6 figs. It is shown that main distinction between impulse and reaction turbines as termed in practice, lies in fact that in first type no expansion of steam occurs in moving blade passages, while in latter type it does take place.

**Lubrication.** Steam Turbine Lubrication. Lubrication, vol. 9, no. 11, Nov. 1923, pp. 129-132, 5 figs. Factors affecting selection of lubricants; characteristics pertinent to the oil.

**Metropolitan-Vickers.** The Metropolitan-Vickers Steam Turbine. Elec. Rev., vol. 93, no. 2404, Dec. 21, 1923, pp. 953-955, 3 figs. Describes 18,750-kw. turbine, as built for Dalmarock power station, Glasgow.

**Nozzles.** Second Report of the Steam-Nozzles Research Committee. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, 1923, pp. 311-348 and (discussion) 349-395, 23 figs. It is believed that results represent first attempt to carry out on full-size scale systematic investigation into efficiency of steam-turbine nozzles; discusses use of impulse method for obtaining thrust of steam at exit of nozzle; use of superheat on both sides of nozzle; variation in initial superheat; use of commercial nozzles and of Callendar's steam tables; calculation of heat drop.

**Principles of Operation.** The Control of Power Production. Chas. L. Hubbard. Factory, vol. 32, no. 1, Jan. 1924, pp. 27-29, 64, 66, 68 and 70, 23 figs. Principles of steam-turbine operation.

**STEEL**

**Automobile.** Automobile Sheet Steel Specifications. H. M. Williams. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 82-88. Salient factors in connection with chemical and physical specifications and inspection of sheet steel for automotive and other similar industrial purposes; tentative specifications of Gen. Motors Co. on cold-rolled strip steel

# Manufactured by **CLASSIFIED LIST OF MECHANICAL EQUIPMENT** Alphabetical List on page 156

**Vacuum Breakers**

- \* Foster Engineering Co.

**Vacuum Dryers, Pans, Pumps, Traps, etc.**  
(See Pans, Pumps, Traps, etc., Vacuum)**Valve Discs**

- \* Edward Valve & Mfg. Co.
- \* Garlock Packing Co.
- \* Goodrich, B. F. Rubber Co.
- \* Jenkins Bros.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)
- \* United States Rubber Co.

**Valves, Air, Automatic**

- \* Davis, G. M. Regulator Co.
- \* Fulton Co.
- \* Jenkins Bros.
- \* Simplex Valve & Meter Co.
- \* Smith, H. B. Co.

**Valves, Air (Operating)**

- \* Foster Engineering Co.

**Valves, Air, Relief**

- \* American Schaeffer & Budenberg Corp'n
- \* Foster Engineering Co.
- \* Fulton Co.
- \* Lunkheimer Co.
- \* Nordberg Mfg. Co.
- \* Schutte & Koerting Co.

**Valves, Altitude**

- \* Foster Engineering Co.
- \* Simplex Valve & Meter Co.

**Valves, Ammonia**

- \* American Schaeffer & Budenberg Corp'n
- \* Crane Co.
- \* De La Vergne Machine Co.
- \* Foster Engineering Co.
- \* Jenkins Bros.
- \* Lunkheimer Co.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)
- \* Vilter Mfg. Co.
- \* Vogt, Henry Machine Co.

**Valves, Back Pressure**

- \* Crane Co.
- \* Davis, G. M. Regulator Co.
- \* Edward Valve & Mfg. Co.
- \* Foster Engineering Co.
- \* H. S. B. W.-Cochrane Corp'n
- \* Jenkins Bros.
- \* Kieley & Mueller (Inc.)
- \* Pittsburgh Valve, Fdry. & Const. Co.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)
- \* Schutte & Koerting Co.

**Valves, Balanced**

- \* Crane Co.
- \* Davis, G. M. Regulator Co.
- \* Foster Engineering Co.
- \* Kieley & Mueller (Inc.)
- \* Lunkheimer Co.
- \* Mason Regulator Co.
- \* Nordberg Mfg. Co.
- \* Schutte & Koerting Co.

**Valves, Blow-off**

- \* Ashton Valve Co.
- \* Bowser, S. F. & Co. (Inc.)
- \* Crane Co.
- \* Crosby Steam Gage & Valve Co.
- \* Edward Valve & Mfg. Co.
- \* Elliott Co.
- \* Jenkins Bros.
- \* Lunkheimer Co.
- \* Pittsburgh Valve, Fdry. & Const. Co.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)

- \* Lunkheimer Co.
- \* Pittsburgh Valve, Fdry. & Const. Co.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)
- \* Schutte & Koerting Co.

**Valves, Non-Return**

- \* Crane Co.
- \* Crosby Steam Gage & Valve Co.
- \* Davis, G. M. Regulator Co.
- \* Edward Valve & Mfg. Co.
- \* Foster Engineering Co.
- \* Jenkins Bros.

**Kieley & Mueller (Inc.)**

- \* Lunkheimer Co.
- \* Pittsburgh Valve, Fdry. & Const. Co.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)
- \* Schutte & Koerting Co.

**Valves, Plug**

- \* Chapman Valve Mfg. Co.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)

**Valves, Pop Safety**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Crane Co.
- \* Crosby Steam Gage & Valve Co.
- \* Lunkheimer Co.

**Valves, Pump**

- \* Bowser, S. F. & Co. (Inc.)
- \* Garlock Packing Co.
- \* Goulds Mfg. Co.
- \* Jenkins Bros.
- \* Johns-Manville (Inc.)
- \* Nordberg Mfg. Co.
- \* United States Rubber Co.

**Valves, Radiator**

- \* American Radiator Co.
- \* Crane Co.
- \* Dean, Payne (Ltd.)
- \* Foster Engineering Co.
- \* Fulton Co.
- \* Jenkins Bros.
- \* Kennedy Valve Mfg. Co.
- \* Lunkheimer Co.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)

**Valves, Radiator, Packless**

- \* American Radiator Co.
- \* Fulton Co.

**Valves, Reducing**

- \* Davis, G. M. Regulator Co.
- \* Edward Valve & Mfg. Co.
- \* Elliott Co.
- \* Foster Engineering Co.
- \* Fulton Co.
- \* Kieley & Mueller (Inc.)
- \* Mason Regulator Co.
- \* Squires, C. E. Co.
- \* Tagliabue, C. J. Mfg. Co.

**Valves, Regulating**

- \* Crane Co.
- \* Davis, G. M. Regulator Co.
- \* Dean, Payne (Ltd.)
- \* Edward Valve & Mfg. Co.
- \* Foster Engineering Co.
- \* Fulton Co.
- \* Kieley & Mueller (Inc.)
- \* Lunkheimer Co.
- \* Simplex Valve & Meter Co.

**Valves, Relief (Water)**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Brown, A. & F. Co.
- \* Crane Co.
- \* Crosby Steam Gage & Valve Co.
- \* Edward Valve & Mfg. Co.
- \* Foster Engineering Co.
- \* Lunkheimer Co.

**Valves, Safety**

- \* American Schaeffer & Budenberg Corp'n
- \* Crane Co.
- \* Crosby Steam Gage & Valve Co.
- \* Jenkins Bros.
- \* Lunkheimer Co.

**Valves, Stop and Check**

- (See Valves, Non-Return)

**Valves, Superheated Steam (Steel)**

- \* Bowser, S. F. & Co. (Inc.)
- \* Chapman Valve Mfg. Co.
- \* Crane Co.
- \* Edward Valve & Mfg. Co.
- \* Jenkins Bros.
- \* Kennedy Valve Mfg. Co.
- \* Lunkheimer Co.
- \* Nordberg Mfg. Co.
- \* Pittsburgh Valve, Fdry. & Const. Co.
- \* Reading Steel Casting Co. (Inc.) (Reading Valve & Fittings Div.)
- \* Schutte & Koerting Co.
- \* Vogt, Henry Machine Co.

**Valves, Thermostatically Operated**

- \* Dean, Payne (Ltd.)
- \* Fulton Co.

**Valves, Throttle**

- \* Crane Co.
- \* Jenkins Bros.
- \* Lunkheimer Co.
- \* Nordberg Mfg. Co.
- \* Pittsburgh Valve, Fdry. & Const. Co.
- \* Reading Steel Casting Co. (Inc.) (Pratt & Cady Division)
- \* Schutte & Koerting Co.

**Valves, Vacuum Heating**

- \* Foster Engineering Co.

**Ventilating Systems**

- \* American Blower Co.
- \* Clavage Fan Co.

**Voltmeters**

- \* Bristol Co.
- \* General Electric Co.
- \* Westinghouse Electric & Mfg. Co.

**Vulcanizers**

- \* Bigelow Co.
- \* Farrell Foundry & Machine Co.

**Wash Bowls**

- \* Manufacturing Equipment & Engrg. Co.

**Washers, Rubber**

- \* Garlock Packing Co.
- \* Goodrich, B. F. Rubber Co.
- \* United States Rubber Co.

**Water Columns**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Kieley & Mueller (Inc.)
- \* Lunkheimer Co.

**Water Purifying Plants**

- \* Graver Corp'n
- \* International Filter Co.
- \* Scaife, Wm. B. & Sons Co.

**Water Softeners**

- \* Graver Corp'n
- \* H. S. B. W.-Cochrane Corp'n
- \* International Filter Co.
- \* Permutit Co.
- \* Scaife, Wm. B. & Sons Co.
- \* Wayne Tank & Pump Co.

**Water Wheels**

- (See Turbines, Hydraulic)

**Waterbacks, Furnace**

- \* Combustion Engineering Corp'n

**Waterproofing Materials**

- \* Johns-Manville (Inc.)

**Wattmeters**

- \* Bristol Co.
- \* General Electric Co.
- \* Westinghouse Electric & Mfg. Co.

**Weighing Machinery, Automatic**

- \* American Machine & Foundry Co.

**Welding and Cutting Work**

- \* Linde Air Products Co.

**Welding Equipment, Electric**

- \* General Electric Co.

**Wheels, Car**

- \* Fuller-Lehigh Co.

**Wheels, Polishing Paper**

- \* Rockwood Mfg. Co.

**Whistles, Steam**

- \* American Schaeffer & Budenberg Corp'n
- \* Ashton Valve Co.
- \* Brown, A. & F. Co.
- \* Crane Co.
- \* Crosby Steam Gage & Valve Co.
- \* Lunkheimer Co.

**Winches**

- \* Brown Hoisting Machinery Co.
- \* Lidgerwood Mfg. Co.

**Wire, All Metals**

- \* Driver-Harris Co.

**Wire, Brass and Copper**

- \* Roebbing's, John A. Sons Co.

**Wire, Flat**

- \* Roebbing's, John A. Sons Co.

**Wire, Iron and Steel**

- \* Roebbing's, John A. Sons Co.

**Wire and Cables, Electrical**

- \* General Electric Co.
- \* Roebbing's, John A. Sons Co.
- \* United States Rubber Co.

**Wire Mechanism (Bowden Wire)**

- \* Gwilliam Co.

**Wire Rope**

- (See Rope, Wire)

**Wire Rope Fastenings**

- \* Lidgerwood Mfg. Co.
- \* Roebbing's, John A. Sons Co.

**Wire Rope Slings**

- \* Roebbing's, John A. Sons Co.

**Wiring Devices**

- \* General Electric Co.

**Worm Gear Drives**

- \* Cleveland Worm & Gear Co.
- \* Foote Bros. Gear & Mach. Co.
- \* James, D. O. Mfg. Co.
- \* Jones, W. A. Fdry. & Mach. Co.
- \* Link-Belt Co.

**Wrapping Machinery**

- \* American Machine & Foundry Co.

**Wrenches**

- \* Roebbing's, John A. Sons Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

and sheet steel, including physical and chemical tests applied to these materials.

**Basic and Acid, Comparative Investigations.** Comparative Investigations of Basic and Acid Steel with the Aid of Research Values (Vergleichende Untersuchungen von basischem und saurem Stahl mit Hilfe der Grosszahlforschung). F. Schmitz. Stahl u. Eisen, vol. 43, no. 50, Dec. 13, 1923, pp. 1536-1539. Compilation of strength and analytical values of 200 basic and 200 acid hearth-furnace steel specimens; recommendations for further research.

**Calorizing.** Use of Aluminum to Prevent Steel Corrosion. A. V. Farr. Chem. & Met. Eng., vol. 29, no. 27, Dec. 31, 1923, pp. 1188-1189. This process, called calorizing, consists in alloying surface of steel with aluminum.

**Chrome.** See CHROME STEEL.

**High-Speed.** See STEEL, HIGH-SPEED.

**Identification at Bin.** How to Identify Nickel and Other Steels at the Bins. H. C. Knerr. Automotive Industries, vol. 49, no. 25, Dec. 20, 1923, pp. 1253-1254. Sparks from emery wheel give indications as to carbon content and certain alloys such as chromium and tungsten; simple chemical test for indicating presence of nickel is easily applied.

**Tests.** The Chemical, Metallographical and Physical Testing of Steel (in Bars) [Die chemische, metallographische und physikalische Prüfung von Stahl (in Stangenform)]. H. Graef. Maschinenbau, vol. 2, no. 24, Sept. 15, 1923, pp. G257-G260, 6 figs. Points out that tensile tests for testing of steel are often inadequate and additional chemical, metallographical and physical tests are necessary; how such tests should be conducted.

[See also IRON AND STEEL.]

## STEEL, HEAT TREATMENT OF

**Electric-Furnace.** Electrical Energy Economical for Heat Treating. E. F. Collins. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 67-81, 3 figs. Reviews relative cost data in operation of electric and fuel-fired furnaces, pointing out that electrical heating is economical and comparable to fuel heating; discusses heat generation, heat conservation, and methods of electric heat transmission and delivery to charge.

**Permanent Magnets.** Investigation of the Treatment of Steel for Permanent Magnets. R. L. Dowdell. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 27-65, 17 figs. Deals with various treatments of tungsten, chromium, cobalt-chrome and miscellaneous magnet steels in order to give them greatest permanent; explains simple but accurate testing apparatus for bar magnets; compares new type of coercive force called open-circuit with usual coercive force; gives magnetic saturation curves, and natural and artificial aging curves for different treatments.

**Salt Baths.** Salt Baths and Containers for Hardening. Sam Tour. Am. Soc. Steel Treating—Trans., vol. 5, no. 1, Jan. 1924, pp. 7-19 and (discussion) 19-26, 7 figs. Discusses salt baths for heating of steel tools and parts and gives simple method of desulphurizing salt bath; decarburizing effects of chloride salt baths at 1600 deg. Fahr., upon materials being treated; photomicrographs of steels heated in various types of salt baths; principles in regard to design of furnaces.

## STEEL, HIGH-SPEED

**Cast Tools.** Casting High Speed Steel Tools. J. M. Quinn. Iron Trade Rev., vol. 75, no. 3, Jan. 17, 1924, pp. 226-230, 6 figs. Methods and theories by two firms manufacturing tools cast to approximate size and shape; how properties of tools can be controlled.

**High-Speed Steel for Cast Tools.** J. M. Quinn. Iron Age, vol. 112, no. 26, Dec. 27, 1923, pp. 1711-1712, 4 figs. Electric melting practice; proportioning and handling charge; molds and heat treatment.

## STEEL MANUFACTURE

**Chemical Dissociation.** Importance of Dissociation of Chemical Compounds in Steel Making. J. Kent Smith. Chem. & Met. Eng., vol. 30, no. 2, Jan. 14, 1924, pp. 49-50. Observations on use of carbonless alloys for introducing alloying metal into steel show significance of chemical dissociation to metallurgists.

## STEEL WORKS

**Developments, 1923.** Increase Mill Capacity in 1923. John D. Knox. Iron Trade Rev., vol. 74, no. 1, Jan. 3, 1924, pp. 50-53. Decline in open-hearth furnace which began six years ago, is checked; sheet and strip mills lead in construction of new rolling units; extensive additions proposed.

**Fuel-Consuming Equipment.** Economical Use of Fuel in the Steel Plant. H. C. Seibert. Assn. Iron & Steel Elec. Engrs., vol. 5, no. 11, Nov. 1923, pp. 621-644 and (discussion) 644-657. Author seeks to show that saving may be realized by improving principal fuel-consuming equipment; presents data in form of heat balances and fuel rates for principal primary and auxiliary fuel-consuming equipment now employed in steel plants; on basis of this data, he discusses thermal efficiency, principal heat losses, and means by which improvements may be effected.

## STOKERS

**Chain-Grate.** A New Balanced Draught Stoker. Eng. & Boiler House Rev., vol. 37, no. 5, Dec. 1923, pp. 147-148, 2 figs. Describes chain-grate stoker with eight speeds, and draft and control at any point of grate, designed by Babcock and Wilcox, Ltd.

**Hand.** Hand Stokers Reduce Operating Labor. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 47-49, 9 figs. Field of application; general description of action; details of construction of different makes.

**Mechanical.** Mechanical Stokers and Details of Furnaces for Special Fuels. Power Plant Eng., vol.

28, no. 1, Jan. 1, 1924, pp. 50-51. Utilization of mechanical stokers for burning coal in lump form and of special furnaces for burning pulverized coal, fuel oil, and gas minimizes fluctuations in firing conditions and results in increased economy.

**Speed Control.** Drive and Speed Control of Mechanical Stokers. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 52-55, 8 figs. Speed-controlling devices are often actuated by air-supply mechanism to give correct proportioning of air to fuel.

**Types.** Mechanical Stokers for the Power Plant. Power Plant Eng., vol. 28, no. 1, Jan. 1, 1924, pp. 56-62, 24 figs. Descriptions of stoker types which meet requirements of present-day steam production.

## STRAIGHTENING MACHINES

**Types.** Reeling and Straightening Machines. W. H. A. Robertson. Machy. (Lond.), vol. 23, nos. 575, 577 and 579, Oct. 4, 18 and Nov. 1, 1923, pp. 21-24, 81-84, and 150-151, 20 figs. Describes types of machines for straightening material after it has been hot or cold worked.

## STREET RAILWAYS

**Peking, China.** The Peking Electric Tramway. P. Y. Tsai. Assn. Chinese & Am. Engrs.—Jl., vol. 4, no. 7, July-Sept. 1923, pp. 1-3, 6 figs. on supp. plates. Now under construction; features in connection with production, transmission, and utilization of electricity; construction costs.

## STRESSES

**Mechanical and Electrical.** The Danger of Fracture through Mechanical and Electrical Stress of Solid Bodies (Die Bruchgefahr bei mechanischer und bei elektrischer Beanspruchung fester Körper). W. Kummer. Schweizerische Bauzeitung, vol. 82, no. 20, Nov. 17, 1923, pp. 253-255, 4 figs. The danger of fracture from electric stress and mechanical stress in single- and in double-axis state of stress; development of stress diagram.

## STRIKES

**Futility of Lockouts and.** The Futility of Lockouts and Strikes. P. Ogilvie. Taylor Soc.—Bul., vol. 8, no. 6, Dec. 1923, pp. 219-224. Deals with settlement of disputes.

## SUPERHEATERS

**Sectional.** A New Sectional Superheater. Power Engr., vol. 19, no. 214, Jan. 1924, p. 24, 2 figs. Describes sectional modification of Adamson-Cruse accumulator-superheater.

## SUPERPOWER

**Scandinavia.** Inter-Scandinavian Power Distribution (Interskandinavisk Kraftoverføring). A. Angelo. Teknisk Tidsskrift (Elektroteknik), vol. 53, no. 40, Oct. 6, 1923, pp. 120-136, 5 figs. Gives results of work of Scandinavian committee appointed in 1921 to investigate project; discusses financial and technical problems in connection with superpower system extending over Sweden, Norway and Denmark; main problem is transmission of power from Norway and Sweden to Denmark; discusses four main alternatives for superpower system and gives detailed description of each.

**Survey, Analysis of.** Super Power or Super Promises. E. Douglas. Nat. Engr., vol. 27, no. 12, Dec. 1923, pp. 758-583. A common-sense analysis of recent superpower survey. Statistics are often misleading unless they are carefully analyzed; on a basis of coal conservation private plant is still logical choice for majority of services.

# T

## TEMPERATURE MEASUREMENTS

**Instruments.** The Control and Measurement of Temperatures. Indus. Management (Lond.), vol. 10, no. 11, Nov. 29, 1923, pp. 303-304 and 306, 5 figs. Describe different types of temperature measuring instruments.

## TERMINALS, RAILWAY

**Buenos Aires.** The Terminal Stations of Buenos Ayres. Wm. Rögind. Ry. Gaz., vol. 39, no. 26, Dec. 28, 1923, pp. 814-826, 14 figs. Extracts from paper read before S. American Ry. Congress in 1922.

## TIRES, RUBBER

**Low-Pressure.** Present Status of the Low Pressure Tire. India Rubber World, vol. 69, no. 3, Dec. 1, 1923, pp. 143-145, 5 figs. Its development and characteristics; advantages and disadvantages; sizes in use; need of standardization.

## TUBES

**Cutting-Off Machine for.** Designs New Cutting Off Machine. E. W. Mikaelson. Iron Trade Rev., vol. 74, no. 2, Jan. 10, 1924, pp. 173-176, 6 figs. Limited floor space is required for new unit which cuts off and reams tubing up to 14-in. diam. at rate of one a minute; automatic feeding mechanism provided.

# V

## VENTILATION

**Requirements and Air-Testing Methods.** Aerology for Amateurs and Others. E. V. Hill. Heat & Vent. Mag., vol. 20, nos. 1, 2, 3, 4, 5, 9, 10 and 12.

Jan., Feb., Mar., Apr., May, Oct., Nov. and Dec. 1923, pp. 35-39 and 49, 44-47, 43-44, 37-40, 43-45, 50-53, 39-41, and 52-55, 32 figs. Evolution of modern ventilation and its effect on present and future practice; known factors that determine suitability of air conditions to human body, their relationship and relative importance, and instruments and methods found best adapted for testing and studying same.

## VIBRATIONS

**Machinery.** The Damping of Machine Vibrations (Ueber Dämpfung von Maschinenschwingungen). D. Thoma. Maschinenbau, vol. 3, no. 4, Nov. 22, 1923, pp. G14-G16, 4 figs. Discusses damping through radiation with aid of practical examples.

## VISCOSIMETERS

**Micell.** New Instrument Developed to Show True Body of Oils. R. W. A. Brewer. Automotive Industries, vol. 49, no. 25, Dec. 20, 1923, pp. 1244-1245, 5 figs. Method devised for obtaining real comparison of viscosity quickly and easily without calculations; device is of cup and ball type, and its use in large number of tests is said to have resulted in great saving of time.

## VOCATIONAL TRAINING

**Machinists.** A Worth While Vocational Training School. H. P. Armson. Can. Machy., vol. 30, no. 26, Dec. 27, 1923, pp. 136-138, 2 figs. Features of educational program of new Collegiate Inst. at St. Catharines, Ont., for giving future machinists well-rounded knowledge of their trade.

**State Regulations.** Vocational Education and Training. Monthly Labor Rev., vol. 17, no. 6, Dec. 1923, pp. 186-190. New apprenticeship regulations in New South Wales; vocational guidance in Brussels; vocational and other educational training by employers in Finland.

# W

## WASTE HEAT

**Utilization.** New Aspects of Waste-Heat Utilization (Neue Gesichtspunkte auf dem Gebiete der Abhitzeverwertung). H. Heller. Gas- u. Wasserfach, vol. 66, nos. 46 and 47, Nov. 17 and 24, 1923, pp. 672-674 and 683-686, 7 figs. Deals with certain problems of waste-heat utilization and discusses modern types of waste-heat installations. Influence of waste-heat boiler on chimney draft; chimney vs. induced draft. Ansbach waste-heat installation; waste-heat boiler with induced draft; hot-water supply from waste heat.

**The Utilization of Waste Heat from Boiler and Drying Plants for Increasing the Efficiency of Furnaces (Die Verwertung der Abgabe von Kessel- und Trockenanlagen zur Erhöhung des Wirkungsgrades der Feuerungen).** H. Claassen. Archiv für Wärmewirtschaft, vol. 4, no. 11, Nov. 1923, pp. 201-203. Process and results of return of waste gases; tests on return of part of boiler waste heat underneath grate; utilization of waste heat from drying plants through return of gases.

## WATER

**Adiabatic Cooling of.** The Adiabatic Cooling of Water and the Temperature of its Maximum Density as a Function of Pressure. N. A. Pushin and E. V. Grebenshchikov. Chem. Soc.—Jl., vol. 123-124, no. 733, Nov. 1923, pp. 2717-2725, 3 figs. Determination of coefficient of adiabatic cooling of water at various temperatures for pressures up to 4000 kg. per square cm.

## WATER POWER

**Project, Development of.** The Development of a Water Power Project. J. C. Smith. Tech. Eng. News, vol. 4, no. 6, Dec. 1923, pp. 214-215 and 219-220. Describes development of a water power including company organization, and financial operation which provided money to carry on work.

## WELDING

**Electric.** See ELECTRIC WELDING; ELECTRIC WELDING, ARC.

**Fusion, Methods and Problems.** Fusion Welding. C. B. Bellis. Chem. & Met. Eng., vol. 30, no. 1, Jan. 7, 1924, p. 17. Varieties of fusion welding; problems still to be solved.

**Oxy-Acetylene.** See OXY-ACETYLENE WELDING.

## WORKMEN'S COMPENSATION

**British Legislation.** The Workmen's Compensation Act, 1923. Engineer, vol. 136, no. 3550, Jan. 11, 1924, pp. 41-42. Discusses new act which came into operation on January 1st, containing many new provisions and introducing new principles.

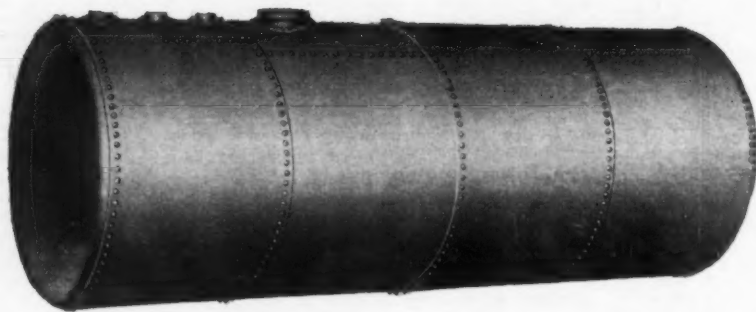

**Social Insurance and.** Workmen's Compensation and Social Insurance. Monthly Labor Rev., vol. 17, no. 6, Dec. 1923, pp. 163-170. Recommendations of American Federation of Labor; invalidity insurance in Denmark.

## WIND MILLS

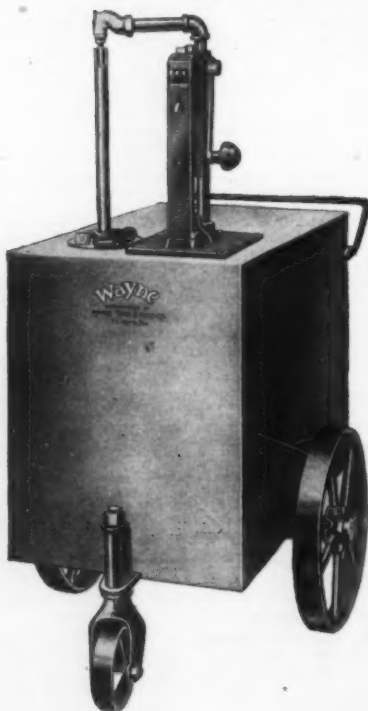

**Electric Plants, Connection with.** The Connection of Electric Plants with Wind Mills (Die Verbindung elektrischer Anlagen mit Windmotoren). A. Werren. Zeit. des Vereines deutscher Ingenieure, vol. 67, no. 49, Dec. 8, 1923, pp. 1097-1099, 6 figs. Discusses properties of wind; investigation of field of energy from wind and influence of automatic regulation of wind wheel; properties of different types of d. c. and 3-phase motors are studied in relation to those of wind wheel.

## WROUGHT IRON

**Uses and Properties.** Some Uses and Properties of Wrought Iron. S. J. Astbury. Instn. Mech. Engrs.—Proc., vol. 1, no. 3, 1923, pp. 511-516. Resistance of iron to shock and to fatigue; structure of wrought iron.

## For the Safe and Economical Handling of Gasoline and Oils in Factories

Here you see the Wayne equipment which is so widely used by factories and mills as to have become almost standard equipment.

Model 88 heavy metal storage tank is made of the finest open heart tank steel rolled cold to exact radius.

### Wayne Model 227 Portable Wheel Tank

One of the most efficient and practical units ever designed for the distribution of liquids to machines. Holds 65 gallons. Equipped with standard quart pumps. Can be fitted with discharge meter, if desired.

### Model 278-T Oil Pump

A five-gallon, long-distance, inside-type pump for the safe, accurate and economical dispensing of oil and other liquids of similar nature.

Absolutely fire-proof; easy to operate; and accurate to a hair. Approved by Underwriters' Laboratories. Parts coming in contact with liquid made of brass or galvanized to prevent rust.

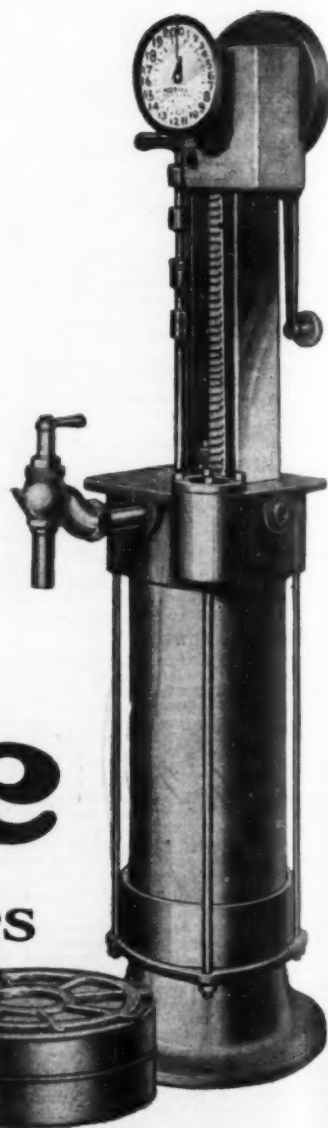

*Write for Booklets and Bulletins*

**Wayne Tank & Pump Co., 709 Canal St.  
Fort Wayne, Indiana**

*Foreign Offices: Toronto, Canada; London, England; Paris, France  
An International Organization With Sales and Service Offices Everywhere*

## HONEST MEASURE PUMPS

# THE ENGINEERING INDEX

(Registered United States, Great Britain and Canada)

**THE ENGINEERING INDEX** presents each month, in conveniently classified form, items descriptive of the articles appearing in the current issues of the world's engineering and scientific press of particular interest to mechanical engineers. At the end of the year the monthly installments are combined along with items dealing with civil, electrical, mining and other branches of engineering, and published in book form, this annual volume having regularly appeared since 1906. In the preparation of the Index by the engineering staff of The American Society of Mechanical Engineers some 1200 technical publications received by the Engineering Societies Library (New York) are regularly reviewed, thus bringing the great resources of that library to the entire engineering profession.

Photoprint copies (while printing on a black background) of any of the articles listed in the Index may be obtained at a price of 25 cents a page. When ordering photoprints identify the article by quoting from the Index item: (1) Title of article; (2) Name of periodical in which it appeared; (3) Volume, number, and date of publication of periodical; (4) Page numbers. A remittance of 25 cents a page should accompany the order. Orders should be sent to the Engineering Societies Library, 29 West 39th Street, New York.

(See also page 234 of this issue for supplementary items.)

## ABRASIVE WHEELS

**Diamonds for Truing, Mounting of.** Mounting Diamonds by Casting, H. Miller. Abrasive Industry, vol. 5, no. 1, Jan. 1924, pp. 1-2, 2 figs. Description of a practical method.

## ACCELEROMETERS

**Automobile Acceleration, Measurement.** New Quantitative Method of Measuring the Riding Comfort of Automobiles, F. H. Norton. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 136-138, 3 figs. Discusses accelerations acting on passenger, and design of accelerometer; accuracy of readings; factors to be considered in further study.

## ACCIDENTS

**Industrial.** Industrial Accidents and Hygiene. Monthly Labor Rev., vol. 18, no. 1, Jan. 1924, pp. 142-156. Conference on industrial accident rates called by U. S. Dept. of Labor; record of industrial accidents in United States for 1922; coke-oven accidents during 1922; accidents on steam railroads; decline in tuberculosis death rate; health conditions among chemical workers with respect to earnings.

## AERONAUTICS

**Developments.** Aeronautics in 1923. Engineer, vol. 137, nos. 3549 and 3550, Jan. 4 and 11, 1924, pp. 22-24, and 36-38 and 44, 19 figs. partly on supp. plate. Civil aviation; light airplanes; military aeronautics; helicopters; airships; typical British airplanes.

Some Recent Developments in Aircraft Instruments, H. E. Wimperis. Roy. Aeronautical Soc.—Jl., vol. 28, no. 157, Jan. 1924, pp. 3-29 and (discussion) 29-34, 15 figs. Discusses instruments for D. R. navigation and astronomical navigation, method of reducing sextant observations, determination of height, magnetic compass, etc.

## AIR COMPRESSORS

**High-Speed.** High-Speed Air Compressors, J. M. Walshe. Iron & Coal Trades Rev., vol. 108, no. 2916, Jan. 18, 1924, pp. 98-99. Automatic control of air output; air-cylinder lubrication; explosions in air receivers and pipes; air pipework; air receivers; turbo-compressors. Paper read before Birmingham Assn. Mech. Engrs.

## AIRCRAFT

**British Industry.** Problems of Aircraft Production in Great Britain. Aviation, vol. 16, no. 6, Feb. 11, 1924, pp. 151-153. How Great Britain fosters her aircraft industry.

**Metal Construction.** The Metal Construction of Aircraft. Aeroplane, vol. 26, no. 4, Jan. 23, 1924, pp. 76 and 78 (includes discussion). Abstract of two papers on Materials in Aircraft Construction read by J. D. North and L. Aitchison before Roy. Aeronautical Soc., together forming a whole, illustrating advantages to be derived from improved materials of construction and also some of the difficulties and dangers which are to be encountered in pioneer work in this direction. See also Flight, vol. 16, no. 4, Jan. 24, 1924, pp. 48-52, 6 figs., giving a more detailed account of L. Aitchison's paper, dealing with physical qualities of metals and alloys, particularly from point of view of reliability of such materials as conditioned by margin between ideal or specification strength and real strength which is achieved in practice.

## AIRPLANE ENGINES

**Air-Cooled, Cylinder Gages for.** Two Gages for

Aero-Engine Cylinders, W. H. Thompson. Am. Mach., vol. 60, no. 8, Feb. 21, 1924, pp. 297-298, 3 figs. Describes combination gages for inspecting various dimensions on air-cooled cylinders.

**Light.** A New Engine for Light Planes, G. D. Angle. Aviation, vol. 16, no. 6, Feb. 11, 1924, pp. 146-147. Engine built by Steel Products Eng. Co., Springfield, O., is air-cooled 2-cylinder opposed type operating on 4-cycle principle; develops 12 to 20 hp. and weighs only 50 lb.

## AIRPLANES

**Ambulance.** Development of Airplane Ambulances. Int. Aeronautics, vol. 1, no. 5, Dec. 1923-Jan. 1924, pp. 257-261, 8 figs. Notes on Liberty-engine Fokker, a duplicate of Macready-Kelly transcontinental machine; carries 4 litter patients, 4 sitting patients and surgeon, in addition to pilot; medical equipment.

**Balancing of Moments.** Practical Method for Balancing Airplane Moments, H. Hamburger. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 179, Feb. 1924, 34 pp., 8 figs. Shows how methods described in previous paper (Technische Berichte, vol. 2, no. 3, p. 463) can be practically utilized in computations; it is shown what conclusions can be drawn from diagram of moments in regard to defects in airplanes under investigation and what steps may be taken to remedy them.

**C. K. 2.** The Cox-Klein C. K. 2 Training Biplane. Flight, vol. 16, no. 2, Jan. 10, 1924, p. 17, 1 fig. Two-seater side-by-side tractor biplane for training purposes built for U. S. Army Air Service; Wright model E 190-hp. engine; span 29 ft., chord 5 ft. 6 in., stagger 2 ft., wing area 293 sq. ft., speed range 47-125 m.p.h.

**Commercial, Multi-Motored.** France Develops Multi-Motored Transport Planes, L. D'Orcy. Aviation, vol. 16, no. 3, Jan. 21, 1924, pp. 60-64, 4 figs. Particulars of competition instituted by French air department in fall of 1922, with a view to developing multi-engine airplanes specially designed to answer requirements of long-distance air transport; data on Farman F3X, Farman F4S, Bleriot type 115, Breguet type 22, and Potez type 22, which were among the entries.

**Curvilinear Flight of.** Curvilinear Flight of Airplanes, E. Salkowski. Nat. Advisory Committee for Aeronautics, Technical Notes, No. 176, Jan. 1924, 21 pp., 6 figs. on supp. pages. Results of investigation by Hoff, Hopf and writer. Describes method of calculation without any assumption in regard to variation of engine power with altitude and only with assumption that this relation is, in fact, empirically known from measurements taken in altitude tests. Translated from Technische Berichte, vol. 3, no. 7, pp. 267-274.

**German Commercial.** Three New German Commercial Airplanes. Aviation, vol. 16, no. 6, Feb. 11, 1924, p. 155, 3 figs. Small-capacity passenger carriers with interesting features; details of Mark 4-seater, Udet 3-seater and Caspar 3-seater.

**Gliders.** The Magnan Monoplane Glider. Flight, vol. 16, no. 4, Jan. 24, 1924, pp. 43-44, 3 figs. Description of a French machine designed for gliding, known as Type Marin M. 2; span 37 ft. 9 in., length 16 ft. 3 in., chord 4 ft. 3 in., wing area 110 sq. ft.

**Gourdou-Lesgourd.** A Bristol "Jupiter" Makes History in France. Flight, vol. 15, no. 45, Nov. 8, 1923, 681-682, 3 figs. Particulars of Gourdou-Lesgourd all-metal monoplane, designed as a single-seater fighter; streamlined Bristol "Jupiter" engine; speed of 223.7 m.p.h. attained.

**Pixie.** The Parnall "Pixie" Light 'Plain. Flight vol. 15, no. 43, Oct. 25, 1923, pp. 653-654, 4 figs. Particulars of Pixie I, with 500-cc. Douglas engine, wing area 100 sq. ft., span 28 ft. 6 in., and length 18 ft.; and Pixie II, with 750-cc. Douglas engine, wing area, 60 sq. ft., span 17 ft. 10 in., and length 18 ft.

**R. V/23.** The Stahlwerk-Mark R. V/23 Commercial Monoplane. Flight, vol. 16, no. 3, Jan. 17, 1924, pp. 31-32, 3 figs. Particulars of German four-seater parasol monoplane; 100-hp. 6-cylinder-in-line Mercedes engine; span 46 ft. 9 in., length 25 ft. 11 in., wing area 290.5 sq. ft.

**Sesefsky.** A Roumanian Airplane. Flight, vol. 16, no. 1, Jan. 3, 1924, pp. 3-4, 2 figs. Describes Sesefsky tractor biplane, a military machine intended for reconnaissance work; vertical triangular fin built up of multi-ply wood integral with fuselage; 250-hp. Astra-Benz engine; speed 115 m.p.h.; span 41 ft. 4 in., length 28 ft. 2 in., wing area 394 sq. ft.

**Swanson-Freeman.** The Swanson-Freeman SS4 Two Seater. Aviation, vol. 16, no. 4, Jan. 28, 1924, pp. 93-94, 1 fig. Equipped with 80-hp. LeRhone air-cooled rotary engine.

**Udet.** The New Udet Commercial Monoplane Flight, vol. 15, no. 47, Nov. 22, 1923, pp. 709-710 2 figs. Particulars of German three-seater of very clean design; a high-wing monoplane of streamline design; 70-hp. Siemens engine; span 39 ft. 4 in., length 23 ft. 10 in., wing area 212 sq. ft., maximum speed 111.6 m.p.h.

**Wings.** Proposal for Standardization of the Method of Computing Wing Sections, A. Gv. Paumbauer. Int. Aeronautics, vol. 1, no. 5, Dec. 1923-Jan. 1924, pp. 274-276 and 292, 2 figs. Report of Ryks-Studiedienst Voor de Luchtvaart, Amsterdam, Holland.

Note on the Relative Effect of the Dihedral and the Sweep Back of Airplane Wings, M. M. Munk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 177, Jan. 1924, 4 pp. It appears from investigation that effect of sweep back is always smaller than that of dihedral.

## AIRSHIPS

**Fuel Consumption.** The Compensation in Weight of Fuel Consumption of Airships, G. A. Crocco. Int. Aeronautics, vol. 1, no. 5, Dec. 1923-Jan. 1924, pp. 277-278. Condensation of combustion water.

**Hydrogen vs. Helium for.** Urges Hydrogen for Polar Flight. Aviation, vol. 16, no. 4, Jan. 28, 1924, pp. 95-96. Ralph Upson, in interview granted Detroit News, warns against inflation with non-inflammable helium and points out advantages of hydrogen over helium for polar flight of Shenandoah.

**Italian Design.** Recent Progress in Italian Airship Construction, Umberto Nobile. Aviation, vol. 16, no. 5, Feb. 4, 1924, pp. 118-122, 4 figs. The SCA, OS and PM airships; keel girder construction; power-plant arrangement; type N airship, shape of hull, and characteristics.

## ALLOYS

**Aluminum.** See ALUMINUM ALLOYS.

**Non-Ferrous, Contraction.** Contraction and Shrinkage of Non-Ferrous Alloys, Rob. J. Anderson. Tech. Eng. News, vol. 4, no. 7, Jan. 1924, pp. 258, 294, 296 and 298. Notes on liquid, solidification and solid shrinkage; linear contraction; factors affecting contraction of alloy on casting.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**ALUMINUM ALLOYS**

**Airplane Structural Work.** Data on Aluminum Alloys for Airplane Structural Work, Fr. H. Colvin. *Am. Mach.*, vol. 60, no. 7, Feb. 14, 1924, pp. 235-238, 9 figs. Standardizing channels, struts and other parts for construction of all-metal planes, even in small quantities; sizes and strength of rivets; distribution of weight.

**Casting-Temperature Effects.** The Influence of Casting Temperature of Aluminum Alloys, F. H. Hurren. *Foundry Trade J.*, vol. 29, no. 388, Jan. 24, 1924, pp. 75-79. Results of experiments. Paper read at joint meeting of Instn. British Foundrymen and Inst. Metals.

**Sand-Cast.** Notes on a Sand-Cast Aluminum-Copper-Nickel-Magnesium Alloy, A. J. Lyon and S. Daniels. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 173-181, 12 figs. Describes foundry practice and tabulates physical properties of sand-cast aluminum-base alloy containing 4 per cent of copper, 2 per cent of nickel and 1.5 per cent of magnesium; outlines methods of heat-treating this alloy to obtain maximum hardness and tensile properties; physical testing results were obtained in connection with manufacturing of pistons and air-cooled cylinder heads for aircraft engines.

**APPRENTICES, TRAINING OF**

**Aircraft.** Training of Aircraft Apprentices at Halton Camp. *Engineer*, vol. 137, nos. 3553, 3554 and 3555, Feb. 1, 8 and 15, 1924, pp. 110-120, 138-141 and 167-170, 21 figs., partly on p. 148 and supp. plate. Describes barracks and camp in general, and refers to special training which is given youths while in residence. Choice of apprentices; method of training; heating arrangements; water supply; sanitary and messing arrangements.

**System.** A Modernized Apprentice System. *Machy.* (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 415-418, 6 figs. How apprentices are trained by Warner & Swasey Co., in shop and classroom work.

**ATOMS**

**Structure.** Some Contemporary Advances in Physics, K. K. Darrow. *Bell System Tech. J.*, vol. 3, no. 1, Jan. 1924, pp. 158-178, 13 figs. Deals principally with atomic structure.

**AUTOMOBILE ENGINES**

**Air Cleaners.** Motor Vehicle Makers Give Increased Attention to Air Cleaners, W. L. Carver. *Automotive Industries*, vol. 50, no. 4, Jan. 24, 1924, pp. 180-183, 7 figs. Five passenger cars at New York show carried these units as standard equipment; claimed to eliminate various troubles by preventing dust from entering engine with carburetor air; four different types for car, truck, and bus use.

**Crankcase Drainage Facilities.** Crankcase Drainage Facility and Oil-Sump Capacity, T. A. Warner. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 260-262. Discusses means of reducing percentages of fuel dilution as follows: (1) greater accessibility for draining engine-lubricating oil; (2) greater accessibility for cleaning vital parts before re-assembling, after draining used lubricating oil; and (3) more adequate consideration of crankcase oil-ump design.

**Lubrication.** Some Experiments in the Lubrication of Commercial-Vehicle Engines, H. D. Nickinson. *Automotive Engr.*, vol. 14, no. 185, Jan. 1924, pp. 24-29, 12 figs. Record of commercial tests, carried out in order to ascertain if there is any difference in results obtained when using different brands of lubricating oils for internal-combustion engines, and to see if, for commercial work, it is good policy to buy expensive oil, or otherwise.

**Manifold Design.** Fundamental Improvements in Manifold Design, A. M. Dean, J. W. Swan and C. A. Kirkham. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 130-147, 13 figs. Points out shortcomings of present manifolds and describes principle of Swan manifold, based on equal distribution of wet fuel mixtures in exactly same ratio as that delivered to manifold by carburetor; advantages claimed for manifold of this type.

**Radiators.** Constructing Automobile Radiators, Chas. O. Herb. *Machy.* (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 454-459, 13 figs. Building up radiator cores of flat-fin type from brass stampings and tubes.

**Specifications.** American Stock Engine Specifications. *Motor Transport* (N. Y.), vol. 29, no. 12, Jan. 24, 1924, p. 415. Specifications of the different makes of buses, trucks, tractors, passenger cars, and rail passenger cars.

**V-Type Four-Cylinder.** V-Type Four Cylinder Engine Permits Compact Design, P. M. Heldt. *Automotive Industries*, vol. 50, no. 7, Feb. 14, 1924, pp. 337-339, 6 figs. Difficult problems involved in balance; cylinders may be placed opposite to one another or staggered; two crankshaft arrangements are possible with latter construction; size of angle determines irregularity in sequence of explosions.

**AUTOMOBILE FUELS**

**Winter Tests.** Winter Tests Show Greater Dilution with Heavy Fuels, J. A. C. Warner. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 151-161, 14 figs. Report on results of winter tests by Bur. of Standards; discusses results of analyses of fresh crankcase oils and dilution results before making comparison between those obtained under summer and under winter conditions; notes on dilution vs. mileage; distillation of composite oil samples; comments upon crankcase-oil consumption.

**AUTOMOBILE INDUSTRY**

**Standardization.** Standards Committee Meeting. *Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 189-194. Report of Electrical Equipment Division

on magnet-wire specifications; and of Tire and Rim Division on balloon tires.

**AUTOMOBILE MANUFACTURING PLANTS**

**England.** Modern Production Methods. *Automotive Engr.*, vol. 14, no. 185, Jan. 1924, pp. 15-19, 14 figs. Methods and equipment employed in manufacturing of Sunbeam cars at Wolverhampton, England.

**AUTOMOBILES**

**Ansaldo.** The 14 H.p. Ansaldo Car. *Auto-Motor J.*, vol. 29, no. 3, Jan. 17, 1924, pp. 49-52, 9 figs. Four-cylinder engine of capacity of 1987 cc. having cylinder bore of 72.5 mm. and stroke of 120 mm.; develops 47 hp. at 2900 r.p.m.

**Axles.** American Rear and Front Axle Specifications. *Motor Transport* (N. Y.), vol. 29, no. 12, Jan. 15, 1924, pp. 422-423. Specifications of different makes for passenger cars, buses and trucks.

**Benz.** New 6-Cylinder 40-hp. Car Brought Out by Benz, B. R. Dierfeld. *Automotive Industries*, vol. 50, no. 7, Feb. 14, 1924, pp. 332-336, 7 figs. Engine is L-head type with two  $\frac{1}{2}$ -in. bore and  $\frac{4}{3}$ -in. stroke; radiator is V type; oil tightness of rear bearing on gear housing is secured in novel manner; maximum speed, 53 min. per hr.

**Bodies.** Why Not Build All-Purpose Bodies with Rear Doors? H. W. Perry. *Automotive Industries*, vol. 50, no. 3, Jan. 17, 1924, pp. 126-127. Suggests design for style of body that is obviously first a private passenger car body, but that is adapted for secondary purpose of carrying light loads of miscellaneous articles; side entrance for passengers would be retained and back seat cushions arranged to be folded quickly against rear of front seat.

**Brakes.** Four-Wheel Brakes, H. Perrot. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 101-106, 4 figs. Discusses servo-brake with special reference to Perrot system; advantages of which are set forth specifically; discusses brake-system design in general and comments on brake lining, front springs and various precautionary measures that must be incorporated; explains non-use of equalizers and cites seven specific important items that should govern all four-wheel-brake design; future development of automobile chassis, as affected by present trend of brake-system practice.

**Four-Wheel Braking for Cabs.** W. F. Bradley. *Motor Transport* (Lond.), vol. 35, no. 984, Jan. 7, 1924, pp. 17-18, 5 figs. Experiences in Paris taxicab work; describes newest Parisian taxicab design, the Serex braking system, giving some details of experiences of which it is the outcome.

**The Theory and Advantages of Balanced Brake Forces.** Geo. L. Smith. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 111-116, 4 figs. Describes two methods of brake application in use in United States, and expounds theory of balanced brake forces; practical applications of equalizing mechanism used in road tests of automobile; tests on wet pavements with study of skidding and skid-checking effects; results of tests on hills and effects of speed and pressure.

**Two Types of Brakes for Front Axles Produced by Salisbury.** *Automotive Industries*, vol. 50, no. 7, Feb. 14, 1924, pp. 344-345, 3 figs. Expanding device intended for cars weighing up to 2400 lb. and contracting for somewhat heavier models; unusual feature is use of Elliott-type steering knuckles.

**Calthorpe.** The 12-20 Hp. Calthorpe Chassis Automobile Engr., vol. 14, no. 185, Jan. 1924, pp. 2-9, 15 figs. Four-cylinder engine with cylinders cast in block is bolted to four-speed gear box, power being transmitted through exposed propeller shaft to spiral bevel-driven rear axle.

**Chicago Show.** Chicago Salon Shows Present Trends in Body Design, J. E. Schipper. *Automotive Industries*, vol. 50, no. 6, Feb. 7, 1924, pp. 272-275, 13 figs. Pullman exhibits all-steel model built in accordance with railway practice; Berline type seems likely to replace limousine.

**Differential.** New Type Differential Prevents Traction Loss on Slippery Ground. *Automotive Industries*, vol. 50, no. 6, Feb. 7, 1923, p. 289, 2 figs. Permits driving wheels to rotate at unequal speeds whenever required; marketed under name of Bement drive.

**Electric Equipment.** Problems of Motor-Vehicle Electrical Equipment Maintenance, P. J. Durham. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 162-164. Facts regarding present obstacles to proper maintenance of automotive electrical equipment; among difficulties presented are: diagnosis, headlamps, accessibility, terminal connections, fuses, wiring color code, storage battery, starting motor and generator.

**Finishes.** China Wood Oil Is Used as Base for Baked Color Enamel, W. L. Carver. *Automotive Industries*, vol. 50, no. 7, Feb. 14, 1924, pp. 324-326. New process developed at Olds Motor Works to produce several shades; only slight variation necessary from regular routine of black enameling department. Tung tree nuts, found only in inaccessible parts of China, is base of enamel.

**Front-End Drives.** 1924 Models Show Changing Trends in Front End Drives, J. E. Schipper. *Automotive Industries*, vol. 50, no. 6, Feb. 7, 1924, pp. 290-291, 7 figs. Attention has been concentrated on problem of silence and balance; of manufacturers building own engines, 47 per cent use chain and 53 per cent gear type.

**Fuel Consumption.** Factors in Fuel Economy, Autocar, vol. 52, no. 1472, Jan. 4, 1924, pp. 17-23, 13 figs. Describes some factors that have a distinct influence on good or bad fuel consumption; results of tests carried out on Brooklands track. (Eng.)

**Glasgow Show.** The Scottish Motor Exhibition. *Autocar*, vol. 52, no. 1475, Jan. 25, 1924, pp. 167-180, 28 figs. Data on exhibits at Glasgow show, Jan. 25, Feb. 2, 1924; representative display of British, French,

Italian, American and Canadian cars. See also *Auto-Motor J.*, vol. 29, no. 4, Jan. 24, 1924, pp. 77-82, 40 figs.

**Lancia.** The Lancia "Lambda" Car. *Auto-Motor J.*, vol. 29, no. 4, Jan. 24, 1924, pp. 71-74, 12 figs. Outstanding features are construction of frame and body as one unit, and arrangement of 4-cylinder engine with pairs of cylinders set at an angle, thus keeping crankshaft very short and stiff, with minimum of whip on bearings. Weight 21 cwt. complete, 2.12-liter engine, speed 70 m.p.h.

**Oakland.** The New Oakland Six. *Auto-Motor J.*, vol. 29, no. 1, Jan. 3, 1924, pp. 7-10, 11 figs. Fine example of 6-cylinder design; four-wheeled braking; low running costs.

**Panhard.** The 14-20 Hp. Panhard. *Auto-Motor J.*, vol. 29, no. 2, Jan. 10, 1924, pp. 29-32, 11 figs. Details of French-built sleeve-valve-engined car.

**Torque.** Caring for. Taking the Torque. *Auto-Motor J.*, vol. 29, no. 3, Jan. 17, 1923, pp. 55-57, 10 figs. Some examples of design in connection with taking of torque reaction in motor power transmission.

**Transmission Gears.** The Chandler Transmission. *Auto-Motor J.*, vol. 29, no. 2, Jan. 10, 1924, p. 35, 4 figs. Describes new type of gear which will be incorporated in 1924 models of Chandler car; wheels always in mesh.

**Wheel Slip Testing.** Testing Wheel Slip. *Autocar*, vol. 52, no. 1474, Jan. 18, 1924, pp. 96-98, 3 figs. Results of trials with special instrument evolved to register action of differential.

**Wood for Bodies.** Wood for Automobile Bodies, A. T. Upson and L. N. Erickson. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 2, Feb. 1924, pp. 165-170, 3 figs. Results of survey made by U. S. Forest Products laboratory of species, kinds, grades, sizes and amounts used by automotive industry; woods used for running boards and top bows; grades of lumber used; present status of body-part standardization; quality of stock required; utilization of lumber in body plants; suitability of woods for bodies.

**AVIATION**

**Commercial.** The Practical Difficulties of Commercial Flying, E. T. Courtney. *Roy. Aeronautical Soc.—Jl.*, vol. 28, no. 157, Jan. 1924, pp. 35-41. Considers conditions under which modern commercial airplane flies; difficulties of flying on airplane through bad weather; concludes that commercial flying, before it can be a success, must operate in any weather in which other forms of transport can operate.

**Long-Distance Navigation.** Recent Developments in the Navigation of the Air, H. B. Goodwin. *U. S. Nav. Inst.—Proc.*, vol. 50, no. 251, Jan. 1924, pp. 68-76. Abstract of memoir of voyage by airplane accomplished by two Portuguese naval officers in spring of 1922; consideration of effect of "drift," astronomical navigation; alternative method for zenith distance in Tropics.

**B****BAGASSE**

**Weight Obtained Per Cent Cane.** Calculation of the Bagasse Obtained Per Cent Cane, A. C. Snyder. *La. Planter & Sugar Mfr.*, vol. 72, no. 2, Jan. 12, 1924, pp. 31-33. Method of calculating weight of bagasse obtained per-cent cane, when grinding with saturation, intended as indirect way of attaining per-cent sucrose in cane.

**BALANCING**

**Large Rotating Apparatus.** I. C. Fletcher. *Elec. J.*, vol. 21, no. 1, Jan. 1924, pp. 5-10, 5 figs. Describes modern design of balancing machine and method of balancing.

**BEAMS**

**Calculation.** The Calculation of Beams Fixed at Both Ends with Special Regard to Longitudinal Strength (Zur Berechnung des beiderseits eingemauerten Trägers unter besonderer Berücksichtigung der Längskraft), F. Takabeya. *Kyushu Imperial University, College of Eng.—Memoirs*, vol. 2, no. 7, 1922, pp. 277-326, 28 figs. and supp. tables. Development of general equations.

**BEARINGS**

**Babbitted.** Pointers in the Casting of Babbitt Bearings, J. V. Romig. *Can. Machy.*, vol. 31, no. 1, Jan. 3, 1924, p. 34, 4 figs. Metal must be well stirred and hot enough to ignite a dry pine sliver; white lead or smoke on shaft provides necessary clearance. See also *Can. Foundryman*, vol. 15, no. 1, Jan. 1923, p. 19, 4 figs.

**BEARINGS, BALL**

**Automobile.** Manufacture of. Making Ball Bearings for Automobiles, H. R. Simonds. *Iron Trade Rev.*, vol. 74, no. 5, Jan. 31, 1924, pp. 345-349, 9 figs. Describes manufacture of radial bearings at Chicago plant of U. S. Ball Bearing Mfg. Co.

**BEARINGS, ROLLER**

**Railway Motor Cars.** New Tests with Roller Bearings on Railway Motor Cars (Neue Versuche mit Rollenlagern an Oeltriebwagen), W. Bethge. *Motorwagen*, vol. 27, no. 1, Jan. 10, 1924, pp. 6-7, 1 fig. Advantages and economy of roller bearings compared with journal bearings.

**BLAST-FURNACE GAS**

**Cleaning.** Dry Cleaning Blast Furnace Gas by Filtration Through Flue Dust, Geo. B. Cramp. *Blast Furnace & Steel Plant*, vol. 12, no. 2, Feb. 1924, pp.

Manufactured by

**Conveyors, Bucket, Pan or Apron**

- \* Brown Hoisting Machinery Co.
- Chain Belt Co.
- \* Gifford-Wood Co.
- \* Jones, W. A. Fdry. & Mach. Co.
- Link-Belt Co.

101-103, 2 figs. Careful tests and investigation of conditions at each individual blast furnace necessary in determining area of dry cleaner.

**Dust Removal.** Removing Dust from Blast Furnace Gases, N. H. Gellert. *Iron Age*, vol. 113, no. 6, Feb. 7, 1924, pp. 422-425, 1 fig. Electrolytic process installed by Colorado Fuel & Iron Co.; corona discharge produces ionized field which precipitates dust. (Abstract.) Paper read before Pueblo Soc. Engrs.

#### BLAST FURNACES

**Hot-Blast Stoves.** Theory and Calculation of Hot-Blast Stoves (Zur Theorie und Berechnung der Winderhitzer). H. Gröber. *Stahl u. Eisen*, vol. 44, no. 2, Jan. 10, 1924, pp. 33-39, 9 figs. Discusses physical laws according to which heat circulates in stove, and describes method by which a scientifically perfect theory and calculation can be developed; results of this work are also applicable to regenerators of open-hearth furnaces and similar industrial furnaces.

**Stoves for Heating of.** Recent Experiences with Accelerated Heating of Blast-Furnace Stoves, A. Welsch. *Fuels & Furnaces*, vol. 2, no. 1, Jan. 1924, pp. 83-84, 2 figs. (Abstract.) Translated from *Stahl u. Eisen*, vol. 43, p. 1339, 1923.

#### BOILER FEEDWATER

**Air Separator.** The Hickman Air Separator. *West Machy World*, vol. 15, no. 1, Jan. 1924, p. 42, 1 fig. Describes simple mechanical device which extracts air bubbles from feedwater just after water has passed through feedwater heater, practically eliminating interior corrosion.

**Feed Regulation.** Boiler Feed-Water Regulation. *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 44-51, 16 figs. Describes several designs of regulators.

**Heating.** The Heating of Boiler Feedwater by Means of Steam Extracted from the Turbine (Réchauffage de l'eau d'alimentation de la chaudière au moyen de vapeur extraite de la turbine), A. Schlag. *Revue Universelle des Mines*, vol. 67, no. 1, Jan. 1, 1924, pp. 7-18, 6 figs. Calculation of actual saving of heat effected by this method.

**Treatment.** Boiler Corrosion and the Treatment of Boiler Feed Water, A. Winstanley. *Colliery Guardian*, vol. 127, nos. 3289 and 3290, Jan. 11 and 18, 1924, pp. 90-91 and 158. Pitting; lime soda process for pitting; general thinning; grooving, and other mechanical damage; treatment of boiler feedwater. From paper read before Past and Present Min. Students' Assn.

**Feed Water for Efficient Boiler Operation.** M. F. Newman. *Combustion*, vol. 10, no. 1, Jan. 1924, pp. 39-40. A principle of treating boiler feedwater to reduce to a minimum difficulties arising from impurities in water.

#### BOILER FIRING

**Excess-Air Calculation.** Calculation of Excess Air, P. Verbeck. *Combustion*, vol. 10, no. 1, Jan. 1924, p. 61. Method of calculating excess air in boiler installations. Translated from *Chemiker Zeitung*, Aug. 9, 1923, pp. 681-682.

**Oil.** Burning Oil and Gas under Steam Boilers. *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 12-28, 37 figs. Coal versus fuel oil; oil-burning systems; types of burners and their application to boiler furnaces; operating data.

#### BOILER FURNACES

**Air Preheating.** Boiler-Test Results with Preheated Air, C. W. E. Clarke. *Mech. Engr.*, vol. 46, no. 2, Feb. 1924, pp. 64-72, 10 figs. Data on elaborate tests recently carried out on units of Colfax station of Duquesne Light Co., showing that efficiency of unit is increased from 5 to 7 per cent by use of preheater. (Abstract.)

**Anthracite-Dust-Burning.** New Furnace Solves Problem of Burning Anthracite Dust, C. H. S. Tupholme. *Coal Age*, vol. 25, no. 5, Jan. 31, 1924, pp. 175-176, 4 figs. Difficulty in ignition and tendency to clog air passages overcome; piles at Welsh pits hitherto considered only waste now valuable.

**Grates.** Stationary, Shaking, Dumping Grates and Hand Stokers. *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 64-74, 24 figs. Points to be remembered when selecting a grate; adaptability of various designs, how they are handled and their application to boiler furnaces.

**Linings.** Boiler Furnace Economies, W. H. Gaylord, Jr. *Ariz. Min. J.*, vol. 7, no. 16, Jan. 15, 1924, pp. 30-32, 5 figs. How old linings are used for repairs and reconstruction.

**Plastic Material for Lining Boiler Furnaces.** *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 9-11, 6 figs. Application of plastic materials for complete lining of new furnaces, facing of bridlewall and arches in Dutch-oven furnaces, making or lining of fire-door arches and rear arch for return tubular boilers, and baffles for all forms of water-tube boilers, as well as repairing of these parts.

#### BOILER OPERATION

**Control Systems.** Modern Systems of Boiler Control, J. B. C. Kershaw. *Engineer*, vol. 137, no. 3554, Feb. 8, 1924, pp. 141-144, 5 figs. Bonus systems in the boiler house and how it is applied in certain British industrial and power plants; a German scheme of bonus payments; an American method of control.

**Efficiency in.** Boiler-House Efficiency, Jas. T. Beard. *2nd. Power*, vol. 50, no. 5, Jan. 29, 1924, pp. 168-170. Points out that high CO<sub>2</sub> is only one element of high overall efficiency; consideration must also be given to loss of fuel through grate, incomplete combustion and poor heat absorption due to soot, scale and leaky baffles.

**Increases in Boiler Efficiency.** V. Z. Caracristi. *Combustion*, vol. 10, no. 1, Jan. 1924, pp. 32-36, 3 figs. How they should be considered in relation to other

factors to obtain lowest cost per unit of boiler output; relationship of various factors can be determined by means of three carefully prepared charts (as those illustrated).

#### BOILER PLANTS

**Remodeling.** Remodeling a Large Boiler Room. *Power Plant Eng.*, vol. 28, no. 4, Feb. 15, 1924, pp. 221-225, 11 figs. Replacement of old boilers at St. Louis pumping station and unusual engineering problems involved.

#### BOILER PLATE

**Alloy Steels for.** Boiler Plate (Die Kesselbaustoffe), P. Goerens. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 3, Jan. 19, 1924, pp. 41-47, 11 figs. Deals with properties of unalloyed low-carbon steel and alloyed boiler plate at different temperatures, and influences of aging and recrystallization on these, which demonstrate advisability of using materials of higher limit of elongation, such as alloy steels; points out that boiler drums of maximum size and wall thickness can now be made of plain and alloy steels.

#### BOILERMAKING

**Flanging Machine, Furnace-Mouth.** Furnace Mouth Flanging Machine. *Machy. (Lond.)*, vol. 23, no. 590, Jan. 17, 1924, pp. 521-523, 4 figs. Machine specially designed for flanging furnace mouths and manholes of marine boiler-end plates, which is used where ordinary flanging machine is not of sufficient power to flange furnace mouths or where it is fully employed on plain flanging.

**France.** The Trend in French Boiler Construction, G. L. Carden. *Boiler Maker*, vol. 24, no. 1, Jan. 1924, pp. 1-3, 2 figs. Progress as shown at Y. & A. Niclausse works; tendency to larger units; noteworthy installations.

#### BOILERS

**Gas-Fired.** Gas-Fired Boilers, J. D. Troup. *Combustion*, vol. 10, no. 2, Feb. 1924, pp. 110-113, 4 figs. Discussion of increasing importance of gaseous fuel as a possible or probable development of future, and of experience obtained and equipment available in use of gas for generating steam.

**Heat-Balance Calculation.** Discussion of the Heat Balance in Boiler Tests, A. Linguet. *Paper Trade J.*, vol. 78, no. 5, Jan. 31, 1924, pp. 49-53. Discusses value of heat-balance calculations in making boiler tests. Translated from *Chimie et Industrie*, vol. 10, no. 5, Nov. 1923.

**Hydrostatic Tests.** Hydrostatic Pressure Tests on Boilers, W. H. Fittus. *Power Plant Eng.*, vol. 28, no. 4, Feb. 15, 1924, pp. 219-220. Points out that many defects are not revealed by hydrostatic test; inspector must depend on visual examinations and hammer test.

**Inspection.** Proposed Rules for the Inspection of Material and Boilers. *Mech. Engr.*, vol. 46, no. 2, Feb. 1924, pp. 100-103, 1 fig. Preliminary report of sub-committee of A.S.M.E. boiler code committee on rules for inspection of material and boilers.

**Mercury-Vapor.** The Emmet Mercury Vapor Plant. *Engineer*, vol. 137, no. 3551, Jan. 18, 1924, pp. 65-68, 4 figs. General arrangements and details of plant installed at Hartford Elec. Light Co.'s station at Hartford, Conn.

**The Mercury-Vapor Boiler and Turbine.** *Mech. Engr.*, vol. 46, no. 2, Feb. 1924, pp. 91-93, 3 figs. Describes plant installed at Hartford and basic idea of plant; properties of mercury vapor which make it advantageous for use in binary-vapor system; difficulties with use of mercury; recent discussion on mercury-vapor system.

**Oil Firing.** Oil Firing of Steam Boilers, F. Dawson. *Eng. & Boiler House Rev.*, vol. 37, no. 7, Feb. 1924, pp. 226, 228, 230 and 232, 10 figs. Deals with fundamental economic factors in order to show advantages which oil firing offers steam user.

**Scale Removal.** Boiler Scale and Scale Cleaners. *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 38-44, 21 figs. Formation of scale in boilers, its dangers, methods of removing scale and preventing its formation.

**Settings.** Boiler Setting for Economical Steaming, Z. Kogan. *Sugar*, vol. 26, nos. 1 and 2, Jan. and Feb. 1924, pp. 8-9 and 77-78, 15 figs. Analysis of problem from sugar engineer's standpoint.

**Waste-Heat.** Practical Experiences with Waste-Heat Boilers Back of Open-Hearth Furnaces (Betriebs-erfahrungen mit Abhitzeesseln hinter Siemens Martin-Ofen), W. Schuster. *Stahl u. Eisen*, vol. 44, no. 3, Jan. 17, 1924, pp. 65-71, 4 figs. Describes four different types of boiler for waste-heat utilization in open-hearth furnaces, and gives operating results of three types; problem of superheater and preheater; prospects.

**Waste-Heat Boilers.** C. H. Bamber. *Gas World*, vol. 80, no. 2059, Jan. 5, 1924, pp. 19-20. Waste-heat versus solid fuel and convection versus radiation; waste-heat boiler design; water-tube boiler for waste heat; fire-tube boiler. Paper read before Manchester and District Jr. Gas Assn.

**Water Circulation in.** Chasing Bubbles in a Boiler. *Power*, vol. 50, no. 8, Feb. 19, 1924, pp. 288-289, 6 figs. Outline of where steam forms in boiler and path of water circulation; describes glass model boiler used in study.

#### BOILERS, WATER-TUBE

**British Developments.** British Developments in Water Tube Boilers, F. Johnstone-Taylor. *Power Plant Eng.*, vol. 28, no. 3, Feb. 1, 1924, pp. 173-174, 3 figs. New designs provide for independent circulation of water in tubes nearest fuel bed.

**Clayton.** The Clayton Water-Tube Boilers, W. S. Findlay. *Power Engr.*, vol. 19, no. 215, Feb. 1924, pp. 52-53 and 62, 4 figs. Critical discussion of special features, and particularly of circulation.

**Hindley Vertical.** The Hindley Vertical Boiler. *Engineering*, vol. 117, no. 3030, Jan. 25, 1925, p. 121, 2 figs. Boiler is vertical-tube type, with superheater arranged in smoke-box above upper tube plate.

#### BORING MACHINES

**Tires.** New Tire-Boring Machine. *Engineer*, vol. 137, no. 3553, Feb. 1, 1924, pp. 126-127, 6 figs. New type of machine for boring and reaming locomotive and car tires.

#### BOXES

**Fiber Shipping Cases.** Fiber Shipping Case Economies, Wm. A. Vollmer. *Mgt. & Administration*, vol. 7, no. 2, Feb. 1924, pp. 187-193, 10 figs. Notes on standardization of packing; coordinating speed of production and packing; machinery for making packing; demonstration of best design; corrugated containers.

#### BRAKING

**Automatic Valve Operation.** Improvement of Air Apparatus in Train Control. *Ry. Age*, vol. 76, no. 7, Feb. 16, 1924, pp. 425-427, 3 figs. Indiana Equipment Corp. develops valves to give graduated reduction of brake-pipe pressure.

#### BUSES

**Trolley.** Railless Trolley Cars at Ipswich. *Tramway & Ry. World*, vol. 55, no. 3, Jan. 17, 1924, pp. 9-13, 11 figs. Description of three single-deck trolley buses with seating capacity of 30 passengers each, loaned to Ipswich Corporation Tramways (Lond.) by Railless Ltd. for demonstration purposes, because of company's considering replacement of tramway system with railless system; experiment successful.

## C

#### CAR DUMPERS

**Rotary.** Rotary Car Dumper Used at Cahokia. *Elec. World*, vol. 83, no. 6, Feb. 9, 1924, p. 286, 1 fig. Gondola coal-car dumper, installed in plant of Union Elec. Light & Power Co., St. Louis, is capable of dumping 50-ton car in one minute and ten seconds with one unskilled attendant and 35-hp. operating motor. See also description by E. H. Kidder in *Gas-Age Rec.*, vol. 53, no. 4, Jan. 26, 1924, pp. 101-102, 2 figs.

**Revolving Car Dumper Handles All Sizes of Open Top Cars.** *Ry. Rev.*, vol. 74, no. 5, Feb. 2, 1924, pp. 226-228, 4 figs. Details of W-S-M revolving car dumper developed to meet demand for low-capacity machine adaptable to plants where first cost of installation is governing factor, but where high efficiency, low operating cost and minimum labor are required.

#### CAR HEATING

**Thermostat Equipment.** Getting Best Results with Heater Control Equipment, L. P. Hynes. *Elec. Ry. J.*, vol. 63, no. 3, Jan. 19, 1924, pp. 97-100, 4 figs. How to install, inspect, test and maintain mercury thermostat equipment in order to get best operating results and minimize maintenance expense; methods recommended as best by one manufacturer as result of experience on many properties.

#### CARS, FREIGHT

**Inspection and Maintenance.** Inspection and Maintenance of Freight Cars, E. Erickson. *Ry. Mech. Engr.*, vol. 98, no. 2, Feb. 1924, pp. 98-100, 2 figs. Inspection of cars on arrival at receiving yard; cars coming from connections; inspection and repair in classification yards; inspection at miscellaneous loading points; inspection and repair on repair or shop tracks.

**L. M. & S. Ry. Construction System.** Rapid Wagon Building in Railway Works. *Ry. Gaz.*, vol. 40, no. 1, Jan. 4, 1924, pp. 11-19, 18 figs. Describes new system installed at Derby Works of Lond. Midland & Scottish Ry. for building clearing house standard 12-ton cars.

**Large-Capacity.** Experimental 50-Ton Capacity German Freight Cars. *Ry. Rev.*, vol. 74, no. 6, Feb. 9, 1924, pp. 257-259, 3 figs. New types of convertible coal cars developed as adaptations from American practice to meet economic conditions.

**Types Built in 1923.** Freight Cars. *Ry. Rev.*, vol. 74, no. 1, Jan. 5, 1924, pp. 19-44, 65 figs. Representative examples of double-sheathed box, single-sheathed box, single-sheathed automobile and furniture, refrigerator, gondola, hopper, flat, steel tank, and caboose cars, and of miscellaneous freight-car equipment, built in 1923, giving principal dimensions and data, builder, and railroad built for.

#### CARS, PASSENGER

**Long Island Ry.** Features of New Long Island Cars. *Elec. Ry. J.*, vol. 63, no. 5, Feb. 2, 1924, pp. 167-170, 7 figs. Framing designed to resist collapse in collision and facilitate repairs when damaged; two motors per car arranged for top field control; length 64 ft. 5 1/4 in., width overall 9 ft. 10 1/2 in., seating capacity 78.

**Queensland Government Rys., Australia.** New Mail Trains for the Brisbane-Townsville Service, Queensland Government Railways. *Ry. Gaz.*, vol. 40, no. 3, Jan. 18, 1924, pp. 78-81, 8 figs. Three complete trains built, each consisting of eight vehicles: 2 first-class Pullman sleepers, 2 second-class sleepers, 1 composite sleeper, 1 post office car, 1 mail and luggage van, and 1 guard's van. Brief description of each car.

**Types Built in 1923.** Representative Examples of Passenger Train Cars Built in 1923. *Ry. Rev.*, vol. 74, no. 1, Jan. 5, 1924, pp. 45-49, 17 figs. Illustrations of baggage, baggage-mail, passenger-baggage, passenger, and express refrigerator cars, with data giving

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volumes

principal dimensions, weight, builder, and railroad built for; illustrations of latest Pullman sleeping-car equipment.

#### CARS, REFRIGERATOR

**Icing Stations.** Engineering of Refrigeration and Development of Car Icing Stations, J. W. Inghram. West. Soc. Engrs.—Jl., vol. 29, no. 1, Jan. 1924, pp. 28-32. Fundamental principles of design and operation of plants located at intervals along main lines of trans-continental railroads, for purpose of replenishing ice in refrigerator cars.

#### CARBON DIOXIDE

**Electrometric Determination.** Investigations in Photosynthesis, H. A. Spoehr and J. M. McGee. Indus. & Eng. Chem., vol. 16, no. 2, Feb. 1924, pp. 128-130, 1 fig. Electrometric method of determining large quantities of carbon dioxide in air stream.

#### CARBURETORS

**Schlee.** The Fuel Stop of the Schlee Carburetor (Die Kraftstoffbremse des Schleevergassers), H. Wimpfinger. Motorwagen, vol. 27, no. 1, Jan. 10, 1924, pp. 2-3, 4 figs. Describes use of fuel stop at light-load nozzle for purpose of automatically stopping supply of fuel from nozzle in manner desired by driver.

#### CASE-HARDENING

**Copper Coating in.** Role of Copper in Case Carburizing, O. A. Knight and E. A. Thomas. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 17-19, 1 fig. Experimental investigation indicates that action of copper in preventing carburization at operating temperatures is physical rather than catalytic.

#### CAST IRON

**Contraction and Piping.** Relation between Contraction and Piping in Cast Iron and the Composition of the Charge, O. Bauer and K. Sipp. Metal Industry (Lond.), vol. 24, no. 4, Jan. 24, 1924, pp. 85-86, 7 figs. Experiments to ascertain relation between contraction and piping in cast iron, and composition of charge, carried out at request of technical committee of German Foundry Assn. Translated from Stahl u. Eisen.

**Electric-Furnace Manufacture.** Electric Furnace Iron Cheap, L. J. Barton. Foundry, vol. 52, no. 2, Jan. 15, 1924, pp. 71-72. Saving effected by use of an all-scrap charge renders electric melting costs lower than for cupola in localities where coke prices are extremely high. Paper read at Am. Foundrymen's Assn. convention.

**Nickel Additions.** Cast Iron Alloyed with Nickel, P. D. Merica. Foundry, vol. 52, no. 4, Feb. 15, 1924, pp. 131-133. Studies of results obtained by additions of nickel in varying percentages; hardness increased and grain structure made more dense. See also Iron Trade Rev., vol. 74, no. 8, Feb. 21, 1924, pp. 555-556.

#### CASTING

**Feeders and Densers in.** Relative Values of Feeders or Densers in Grey Iron and Malleable Iron, E. Longden. Foundry Trade J., vol. 29, no. 386, Jan. 10, 1924, pp. 29-33 and discussion (Jan. 17, 1924) pp. 48-49, 46 figs. Results of experiments; comparison of merits of feeders and densers, and comparison between white and grey iron treated in same way and poured into same form of mold; evidence showing effect of gases in producing unsoundness principally in grey iron.

**Melting and Molding Troubles.** Casting Metals, W. J. Reardon. Metal Industry (N. Y.), vol. 22, nos. 1 and 2, Jan. and Feb., 1924, pp. 7-8 and 64, 10 figs. A series of questions and answers dealing with melting and molding troubles and their solutions.

#### CASTINGS

**Structural Weaknesses, Elimination of.** The Elimination of Structural Weaknesses in Castings, O. Smalley. Foundry Trade J., vol. 29, no. 385, Jan. 3, 1924, pp. 5-11, 15 figs. Deals with structural weaknesses in relation to nature of crystallization of alloy on solidification and design of casting.

**Transformer-Box Production.** Making Transformer Castings, P. Dwyer. Foundry, vol. 52, no. 3, Feb. 1, 1924, pp. 81-85, 10 figs. Describes methods and equipment employed in Pittsfield (Mass.) foundry of Gen. Elec. Co. in making transformer boxes.

#### CENTRAL STATIONS

**Bridgeport, Conn.** Steel Point Station at Bridgeport, W. F. Thompson. Power, vol. 59, no. 7, Feb. 12, 1924, pp. 238-244, 5 figs. Simplicity and accessibility are outstanding features of new plant of United Illuminating Co.

**Diesel Engines for Standby Service.** Diesel Engines for Standby Service in Steam and Hydro Plants, E. B. Pollister. Elec. Light & Power, vol. 2, no. 2, Feb. 1924, pp. 24-26 and 68, 9 figs. Ideal characteristics of a standby and auxiliary prime mover; data on recent installations.

**Interconnection.** A New England Interconnection, R. J. Andrus. Elec. World, vol. 83, no. 3, Jan. 19, 1924, pp. 127-130, 7 figs. Principal features of study undertaken in connection with decision of Twin State Gas & Elec. Co. to interconnect St. Johnsbury (Vt.) division with Berlin (N. H.) division by a transmission line 52 m. long to provide additional capacity; saved building a steam-plant addition.

**Super-Power Plants and Systems.** Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 1-8, 19 figs. Whereby economies in distribution of electrical energy may be obtained through interconnection of electrical systems.

**London Electricity District.** The North Metropolitan Electric Power Supply Company's Undertaking. Elec. Rev., vol. 94, nos. 2406 and 2407, Jan. 4 and 11, 1924, pp. 19-23 and 59-61, 19 figs. Describes additions and improvements which have been made to original installation at Brimsdown.

**Mine-Operated.** This Mine Power Plant Produces Power Cheaply, C. L. Moorman. Coal Age, vol. 25, no. 6, Feb. 7, 1924, pp. 210-212, 4 figs. Tests show cost to be 0.43 cents per kw-hr. under full-load conditions, 1.9 cents on idle days; stokers feed crushed refuse with washed slack; plant near Staunton, Ill., supplies power to three mines of Consolidated Coal Co. of St. Louis.

**Problems.** A Solution of Three Serious Central Station Problems, W. A. Layman. Rose Technic, vol. 33, no. 4, Jan. 1924, pp. 3-6 and 24-25, 3 figs. Discusses idle investment, excess system losses, and poor regulation.

#### CHAIN DRIVE

**Roller Centers, Path of.** The Path of Roller Centers in Chains, G. M. Bartlett. Machy. (Lond.), vol. 23, no. 592, Jan. 31, 1924, pp. 575-577, 5 figs. Results of investigations of paths followed by centers of chain pins when approaching and departing from sprockets both at high and low speeds.

#### CHIMNEYS

**Reinforced-Concrete.** Concrete Chimney to Serve Two Breachings, C. W. Geiger. Power Plant Eng., vol. 28, no. 4, Feb. 15, 1924, pp. 240-242, 1 fig. Brick division wall at breaching openings carried on reinforced-concrete beam placed just below these openings.

**Steel.** Steel Chimneys, F. Johnstone-Taylor. Power Engr., vol. 19, no. 215, Feb. 1924, pp. 45-48, 9 figs. Survey of characteristics and advantages of steel chimneys.

#### CHROMIUM

**Applications in Chemical Industry.** The Importance of Chromium to the Chemical Engineer, Chem. & Met. Eng., vol. 30, no. 4, Jan. 28, 1924, pp. 149-151. Notes on nickel-chromium alloys; chrome irons; metallic chromium.

#### CLUTCHES

**Specifications.** American Stock Clutch Specifications. Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, p. 420. Specifications of different makes for buses, passenger cars, trucks, and tractors.

#### COAL

**Classification.** Classification of Coal That Will Enable Buyer to Know What Kind of Fuel He Is Getting, Geo. H. Ashley. Coal Age, vol. 25, no. 5, Jan. 31, 1924, pp. 167-171, 1 fig. Suggests that coals be divided into ten classes by percentages of fixed carbon with ash equated to 7 per cent; seven new classes added to recognized divisions; graded also for quality. Paper presented before Coal Min. Inst. Am. See also Coal Mine Mgt., vol. 3, no. 1, Jan. 1924, pp. 29-31 and 56-61.

**Measurement by Volume.** Coal Measurement by Volume versus Measurement by Weight, J. E. Lea. Eng. & Boiler House Rev., vol. 37, no. 6, Jan. 1924, pp. 194 and 196, 2 figs. Author points out merits of measurement by volume.

**Thermal Conductivity and Specific Heat.** The Thermal Conductivity and Specific Heat of Coal, F. S. Sinnatt and H. Macpherson. Fuel, vol. 3, no. 12, Jan. 1924, pp. 12-14. Method of determining thermal conductivity and specific heat.

**Value for Steam Generation.** The Value of Coal for Steam Generation, C. A. Joerger. Combustion, vol. 10, no. 1, Jan. 1924, pp. 59-60 and 65. Basis of determining value of a coal, and discussion of some of the items which cause confusion in terms, efficiency, economy, and capacity.

#### COAL HANDLING

**Conveyors for.** Belt Conveyors at Work, J. M. Cowan. Iron & Coal Trades Rev., vol. 108, no. 2914, Jan. 4, 1924, p. 26, 1 fig. Method of roof support for conveyor face; description of conveyors used; shifting of conveyor; gate-end loader. Paper read before East of Scotland Min. Students' Assn.

**Coal Bunkers, Coal and Ash Conveyors.** Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 100-104, 106, 108 and 110, 16 figs. Design of coal bins, method of suspension and how lined; operation and types of coal and ash-conveying apparatus.

**Power Plants.** Coal and Ash Handling Systems for Power Plants, J. W. Geiger. Nat. Engr., vol. 28, no. 2, Feb. 1924, pp. 53-56. Description, advantages and disadvantages of different types of apparatus; factors to be considered in selection.

#### COAL STORAGE

**Economic Phases.** Economic Phases of Coal Storage, F. G. Tryon and W. F. McKenney. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 73-76 and 108, 2 figs. Extent to which practice of storage has already been adopted; inducements to store offered by periodic fluctuations in price and supply of coal. (Abridged.)

#### COKE

**Blast Furnace, Function in.** Reactivity of Coke in Relation to Blast-Furnace Operation, G. St. J. Perrott and R. A. Sherman. Engrs. Soc. West. Pa.—Proc., vol. 39, no. 10, Jan. 1924, pp. 351-369 and (discussion) 370-375, 5 figs. Prevailing views as to function of coke in blast furnace and properties possessed by desirable coke; discusses problem in light of recent data secured by writers, both in laboratory and at blast-furnace plants.

**Reactivity.** The Reactivity (Combustibility) of Coke [Die Reaktionsfähigkeit (Verbrennlichkeit) von Koks], Hans Bahr. Stahl u. Eisen, vol. 44, nos. 1 and 2, Jan. 3 and 10, 1924, pp. 1-9 and 39-42 and (discussion) 42-48, 12 figs. Account and results of author's tests; new method for determination of reactivity; influence of carbon modifications and an artificial powdery-iron addition; conclusions.

#### COKE MANUFACTURE

**Formation of Coke Pieces.** What Occurs in the Formation of Coke, A. Thau. Chem. & Met. Eng., vol. 30, no. 5, Feb. 4, 1924, pp. 222-227, 13 figs. How propagation of coking steam is affected by varying oven conditions and what this means in coke produced.

#### COLD STORAGE

**Plants.** The Railway Cold Stores at Lyon-Perache. Ice & Cold Storage, vol. 27, no. 310, Jan. 1924, pp. 11-13, 3 figs. Describes equipment of a French agricultural cold store to encourage local production.

**Warehouse.** Large Terminal and Cold-Storage Warehouse at Duluth. Eng. News-Rec., vol. 92, no. 8, Feb. 21, 1924, pp. 324-327, 4 figs. Rail and water terminal; reinforced-concrete structure with some steel framing; traffic on two levels; perishable freight; cold-storage insulation; freight-handling equipment.

#### CONDENSERS, STEAM

**Tubes.** Corrosion of Condenser Tubes, Johnstone Taylor. Mar. Eng. & Shipp. Age, vol. 29, no. 2, Feb. 1924, pp. 108-109. Recent investigations prove entrapped air to be cause of rapid corrosion.

#### CONDUITS

**Pressure.** Pressure-Conduit Tests of the Swiss Federal Railway (Kurzer Bericht über die Druckstollen-Versuche der S. B. B.), A. Schrafl. Schweizerische Bauzeitung, vol. 83, nos. 1 and 3, Jan. 5 and 19, 1924, pp. 7-10 and 27-30, 11 figs. Account of work of investigation to determine causes of failure of Ritom tunnel and expert testimony on other tunnels of Swiss Federal Ry.

#### CONVEYORS

**Mail and Parcel Transport.** Mechanical Messengers, R. Heumann. Eng. Progress, vol. 4, no. 12, Dec. 1924, pp. 254-259, 10 figs. Arrangement of pneumatic-tube plant; rope-conveyor plants, employed in business houses and smaller works where correspondence has to be distributed from one central point to different points and recollected; conveyor belts.

#### COOLING TOWERS

**Operation.** Analysis of Cooling Tower Operation, C. S. Robinson. Refrig. Eng., vol. 10, no. 6, Dec. 1923, pp. 201-204, 2 figs. Shows how an analysis of operation of cooling towers permits classification of tests, so that a comparison of the various types of towers is simple and accurate; discusses recent tests on cooling towers.

#### COOPERATIVE SOCIETIES

**Coöperative Shingle Mills.** Coöperation. Monthly Labor Rev., vol. 18, no. 1, Jan. 1924, pp. 170-178. Coöperative shingle mills in Western Washington.

#### CORROSION

**Electrolytic De-Rusting Plant.** The Removal of Rust by Electrolytic Processes, J. P. McLaren. Engineering, vol. 117, no. 3027, Jan. 4, 1924, pp. 25-29, 5 figs. Results of experiments with alkaline bath; efficiency of bath; describes plant and its development; cost of installation.

**Metallic.** The Mechanism of Metallic Corrosion, G. D. Bengough and J. M. Stuart. World Power (formerly Beams), vol. 3, no. 1, Jan. 1924, pp. 25-34, 1 fig. Direct union with oxygen; hydrogen-displacement type of oxidation; formation of and changes in initial scale; corrosion of typical metals.

#### COST ACCOUNTING

**Heat-Treating Department.** The Complete Operation of a Practical Cost System, A. H. Gibson. Factory, vol. 32, no. 2, Feb. 1924, pp. 170-172, 234 and 236, 1 fig. Deals principally with problems of cost accounting in heat-treating department.

#### COTTON

**Research Work.** Practical Application of Research Work, E. D. Walen. Textile World, vol. 65, no. 5, Feb. 2, 1924, pp. 161-162, 4 figs. Work of Cotton Research Co.; analyzes mill problems both in mill and laboratory with cooperation of practical mill men.

#### COTTON MILLS

**Electric Motors for.** Selecting Motors for Cotton Mills, Wm. S. Maddocks. Elec. World, vol. 83, no. 6, Feb. 9, 1924, pp. 272-277, 9 figs. Reasons why standard motors suitable for other plants have been found unsatisfactory; tendencies toward individual drive continue to manifest themselves in this industry.

#### CRANES

**Overhead Traveling, Motors for.** Direct or Alternating Current for Overhead Traveling Cranes, Wm. L. Laing. Am. Mach., vol. 60, no. 4, Jan. 24, 1924, pp. 133-134. Advantages and disadvantages of each type; selecting crane motor with characteristics to fit work; speed, braking, overload capacity, service and other characteristics.

**Underhung-Jib.** 5-Ton Underhung-Jib Crane. Engineer, vol. 136, no. 3550, Jan. 11, 1924, pp. 48-49, 3 figs. Describes overhead traveling crane with underhung jib, object of which is to reach into adjoining bays, or even beyond end of shop in which it is installed, and thus enable loads to be lifted and transferred from shop to shop without use of tramways or trucks.

#### CRANKCASES

**Jigs and Fixtures for.** Jigs and Fixtures for Small Crankcases, A. J. Aires. Am. Mach., vol. 60, no. 8, Jan. 31, 1924, pp. 167-170, 9 figs. Locating crankcase from 4-bolt holes; centering case from center and end bearings; special sleeves for supporting crankcase walls while broaching and burnishing.

#### CUTTING TOOLS

**Cutting Speeds.** Cutting Speeds, Catlin. Eng. Production, vol. 7, no. 136, Jan. 1924, pp. 26-30, 15

# Manufactured by Advertisers CLASSIFIED LIST OF MECHANICAL EQUIPMENT (Alphabetical List on page 150)

**Engines, Steam, Poppet Valve**  
 \* Erie City Iron Works  
 \* Nordberg Mfg. Co.  
 \* Vilter Mfg. Co.

**Engines, Steam, Throttling**  
 \* Brownell Co.  
 \* Clamage Fan Co.  
 \* Engberg's Electric & Mech. Wks.

**Engines, Steam, Unas-Flow**  
 \* Frick Co. (Inc.)  
 \* Harrisburg Fdry. & Mach. Wks.  
 \* Nordberg Mfg. Co.  
 \* Ridgway Dynamo & Engine Co.  
 \* Skinner Engine Co.

**Engines, Steam, Variable Speed**  
 \* Brownell Co.  
 \* Harrisburg Fdry. & Mach. Wks.  
 \* Nordberg Mfg. Co.

**Engines, Steam, Vertical (Fully Enclosed, Self-Oiling)**  
 \* Clamage Fan Co.  
 \* Engberg's Electric & Mech. Wks.  
 \* Troy Engine & Machine Co.

**Engines, Steering**  
 \* Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Lidgerwood Mfg. Co.

**Evaporators**  
 \* Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Croll-Reynolds Engrg. Co. (Inc.)  
 \* Farrel Foundry & Machine Co.  
 \* Vogt, Henry Machine Co.  
 \* Wheeler Condenser & Engrg. Co.

**Excavating Machinery**  
 \* Clyde Iron Works Sales Co.  
 \* Lidgerwood Mfg. Co.  
 \* Link-Belt Co.

**Exhaust Heads**  
 \* Hoppes Mfg. Co.

**Exhaust Systems**  
 \* Allington & Curtis Mfg. Co.  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Sturtevant, B. F. Co.

**Exhausters, Gas**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* General Electric Co.  
 \* Green Fuel Economizer Co.  
 \* Schutte & Koerting Co.  
 \* Sturtevant, B. F. Co.

**Extractors, Centrifugal**  
 \* Fletcher Works  
 \* Tolhurst Machine Works

**Extractors, Oil and Grease**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Kieley & Mueller (Inc.)

**Factory Equipment, Metal Manufacturing Equipment & Engrg. Co.**

**Fans, Exhaust**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Coppus Engineering Corp'n  
 \* General Electric Co.  
 \* Green Fuel Economizer Co.  
 \* Philadelphia Drying Mchry. Co.  
 \* Sturtevant, B. F. Co.

**Fans, Exhaust, Mine**  
 \* Sturtevant, B. F. Co.

**Feeders, Pulverized Fuel**  
 \* Combustion Engineering Corp'n  
 \* Grindley Fuel Equipment Co.  
 \* Smith, F. L. & Co.

**Filters, Air**  
 \* Reed Air Filter Co. (Inc.)

**Filters, Feed Water, Boiler**  
 \* Permutit Co.

**Filters, Feed Water, Demulsifying**  
 \* Permutit Co.

**Filters, Gravity**  
 \* Permutit Co.

**Filters, Mechanical**  
 \* Permutit Co.

**Filters, Oil**  
 \* Bowser, S. F. & Co. (Inc.)  
 \* Elliott Co.  
 \* General Electric Co.  
 \* Nugent, Wm. W. & Co. (Inc.)  
 \* Permutit Co.

**Filters, Pressure**  
 \* Graver Corp'n  
 \* Permutit Co.

**Filters, Water**  
 \* Elliott Co.  
 \* Graver Corp'n  
 \* H. S. B. W.-Cochrane Corp'n  
 \* Permutit Co.  
 \* Scaife, Wm. B. & Sons Co.

**Filtration Plants**  
 \* Graver Corp'n  
 \* H. S. B. W.-Cochrane Corp'n  
 \* International Filter Co.  
 \* Permutit Co.  
 \* Scaife, Wm. B. & Sons Co.

**Fire Brick, Fire Hydrants, etc.**  
 (See Brick, Hydrants, Fire, etc.)

**Fittings, Ammonia**  
 \* Crane Co.  
 \* De La Vergne Machine Co.  
 \* Frick Co. (Inc.)  
 \* Vilter Mfg. Co.  
 \* Vogt, Henry Machine Co.

**Fittings, Compression**  
 \* Bowser, S. F. & Co. (Inc.)  
 \* Lunkenheimer Co.

**Fittings, Flanged**  
 \* Builders Iron Foundry  
 \* Central Foundry Co.  
 \* Crane Co.  
 \* Edward Valve & Mfg. Co.  
 \* Kennedy Valve Mfg. Co.  
 \* Lunkenheimer Co.  
 \* Pittsburgh Valve, Fdry. & Const. Co.  
 \* Reading Steel Casting Co. (Inc.)  
 (Reading Valve & Fittings Div.)  
 \* U. S. Cast Iron Pipe & Fdry. Co.  
 \* Vogt, Henry Machine Co.

**Fittings, Hydraulic**  
 \* Crane Co.  
 \* Pittsburgh Valve, Fdry. & Const. Co.  
 \* Reading Steel Casting Co. (Inc.)  
 (Reading Valve & Fittings Div.)  
 \* Vogt, Henry Machine Co.

**Fittings, Pipe**  
 \* Baco Mfg. Co.  
 \* Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Central Foundry Co.  
 \* Crane Co.  
 \* Kennedy Valve Mfg. Co.  
 \* Lunkenheimer Co.  
 \* Pittsburgh Valve, Fdry. & Const. Co.  
 \* Reading Steel Casting Co. (Inc.)  
 (Reading Valve & Fittings Div.)  
 \* Steere Engineering Co.  
 \* Vogt, Henry Machine Co.

**Fittings, Steel**  
 \* Crane Co.  
 \* Edward Valve & Mfg. Co.  
 \* Lunkenheimer Co.  
 \* Pittsburgh Valve, Fdry. & Const. Co.  
 \* Reading Steel Casting Co. (Inc.)  
 (Reading Valve & Fittings Div.)  
 \* Steere Engineering Co.  
 \* Vogt, Henry Machine Co.

**Flanges**  
 \* American Spiral Pipe Works  
 \* Crane Co.  
 \* Edward Valve & Mfg. Co.  
 \* Kennedy Valve Mfg. Co.  
 \* Lunkenheimer Co.  
 \* Pittsburgh Valve, Fdry. & Const. Co.  
 \* Reading Steel Casting Co. (Inc.)  
 (Reading Valve & Fittings Div.)  
 \* Vogt, Henry Machine Co.

**Flanges, Forged Steel**  
 \* Cann & Saul Steel Co.

**Floor Armor**  
 \* Irving Iron Works Co.

**Floor Stands**  
 \* Chapman Valve Mfg. Co.  
 \* Crane Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Kennedy Valve Mfg. Co.  
 \* Lunkenheimer Co.  
 \* Pittsburgh Valve, Fdry. & Const. Co.  
 \* Reading Steel Casting Co. (Inc.)  
 (Pratt & Cady Division)  
 \* Royersford Fdry. & Mach. Co.  
 \* Schutte & Koerting Co.  
 \* Wood's, T. B. Sons Co.

**Flooring-Grating**  
 \* Irving Iron Works Co.

**Flooring, Metallic**  
 \* Irving Iron Works Co.

**Flooring, Rubber**  
 \* United States Rubber Co.

**Flour Milling Machinery**  
 \* Allis-Chalmers Mfg. Co.

**Flue Gas Analysis Apparatus**  
 \* Tagliabue, C. J. Mfg. Co.

**Fly Wheels**  
 \* Medart Co.  
 \* Nordberg Mfg. Co.  
 \* Wood's, T. B. Sons Co.

**Fonts, Outdoor Bubble**  
 \* Murdock Mfg. & Supply Co.

**Forgings, Drop**  
 \* Vogt, Henry Machine Co.

**Forgings, Hammered**  
 \* Cann & Saul Steel Co.

**Forgings, Iron and Steel**  
 \* Cann & Saul Steel Co.

**Foundry Equipment**  
 \* Northern Engineering Works  
 \* Whiting Corp'n

**Friction Clutches, Hoists, etc.**  
 (See Clutches, Hoists, etc., Friction)

**Friction Drives**  
 \* Rockwood Mfg. Co.

**Frictions, Paper and Iron Link-Belt Co.**  
 \* Rockwood Mfg. Co.

**Fuel Economizers**  
 (See Economizers, Fuel)

**Furnace Construction**  
 \* Furnace Engineering Co.

**Furnaces, Annealing and Tempering**  
 \* General Electric Co.  
 \* Kenworthy, Chas. F. (Inc.)  
 \* Whiting Corp'n

**Furnaces, Boiler**  
 \* American Engineering Co.  
 \* American Spiral Pipe Wks.  
 \* Babcock & Wilcox Co.  
 \* Bernitz Furnace Appliance Co.  
 \* Combustion Engineering Corp'n  
 \* Detroit Stoker Co.  
 \* Riley, Sanford Stoker Co.

**Furnaces, Case Hardening**  
 \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Down Draft**  
 \* O'Brien, John Boiler Works Co.

**Furnaces, Electric**  
 \* Detroit Electric Furnace Co.  
 \* Kenworthy, Chas. F. (Inc.)  
 \* Westinghouse Elect. & Mfg. Co.

**Furnaces, Forging**  
 \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Hardening**  
 \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Heat Treating**  
 \* General Electric Co.  
 \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Melting**  
 \* Detroit Electric Furnace Co.  
 \* General Electric Co.  
 \* Whiting Corp'n

**Furnace, Non-Ferrous**  
 \* Detroit Electric Furnace Co.

**Furnaces, Non-Oxidizing**  
 \* Kenworthy, Chas. F. (Inc.)

**Furnaces, Powdered Coal**  
 \* Grindley Fuel Equipment Co.

**Furnaces, Smokeless**  
 \* American Engineering Co.  
 \* Babcock & Wilcox Co.  
 \* Combustion Engineering Corp'n  
 \* Detroit Stoker Co.  
 \* Herbert Boiler Co.  
 \* Riley, Sanford Stoker Co.

**Fuses**  
 \* General Electric Co.  
 \* Johns-Manville (Inc.)  
 \* Westinghouse Elect. & Mfg. Co.

**Gage Boards**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Crosby Steam Gage & Valve Co.

**Gage Glasses**  
 \* American Schaeffer & Budenberg Corp'n

**Gage Glasses, Inclined**  
 \* Sessure Water Gauge Co.

**Gage Testers**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Crosby Steam Gage & Valve Co.

**Gages, Altitudes**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Crosby Steam Gage & Valve Co.

**Gages, Ammonia**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Crosby Steam Gage & Valve Co.  
 \* Vogt, Henry Machine Co.

**Gages, Differential Pressure**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Bacharach Industrial Instrument Co.  
 \* Bailey Meter Co.  
 \* Tagliabue, C. J. Mfg. Co.  
 \* Uehling Instrument Co.

**Gages, Draft**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Bacharach Industrial Instrument Co.

\* Bailey Meter Co.  
 \* Bristol Co.  
 \* Tagliabue, C. J. Mfg. Co.  
 \* Taylor Instrument Cos.  
 \* Uehling Instrument Co.

**Gages, Hydraulic**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Crosby Steam Gage & Valve Co.

**Gages, Liquid Level**  
 \* Bristol Co.  
 \* Lunkenheimer Co.  
 \* Simplex Valve & Meter Co.

**Gages, Loss of Head**  
 \* Builders Iron Foundry  
 \* Simplex Valve & Meter Co.

**Gages, Measuring (Surface, Depth, Dial, etc.)**  
 \* Norma Co. of America

**Gages, Pressure**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Bacharach Industrial Instrument Co.  
 \* Bailey Meter Co.  
 \* Bristol Co.  
 \* Crosby Steam Gage & Valve Co.  
 \* Tagliabue, C. J. Mfg. Co.  
 \* Uehling Instrument Co.

**Gages, Rate of Flow**  
 \* Bacharach Industrial Instrument Co.  
 \* Bailey Meter Co.  
 \* Builders Iron Foundry  
 \* Simplex Valve & Meter Co.

**Gages, Syphon**  
 \* Tagliabue, C. J. Mfg. Co.

**Gages, Vacuum**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Bacharach Industrial Instrument Co.  
 \* Bristol Co.  
 \* Crosby Steam Gage & Valve Co.  
 \* Tagliabue, C. J. Mfg. Co.  
 \* Taylor Instrument Cos.  
 \* Uehling Instrument Co.

**Gages, Water**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Ashton Valve Co.  
 \* Bristol Co.  
 \* Crane Co.  
 \* Jenkins Bros.  
 \* Lunkenheimer Co.  
 \* Reading Steel Casting Co. (Inc.)  
 (Pratt & Cady Division)  
 \* Simplex Valve & Meter Co.

**Gages, Water Level**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Bristol Co.  
 \* Lunkenheimer Co.  
 \* Simplex Valve & Meter Co.

**Gas Plant Machinery**  
 \* Cole, R. D. Mfg. Co.  
 \* Steere Engineering Co.

**Gaskets**  
 \* Garlock Packing Co.  
 \* Jenkins Bros.  
 \* Johns-Manville (Inc.)  
 \* Sarco Co. (Inc.)

**Gaskets, Iron, Corrugated**  
 \* Smooth-On Mfg. Co.

**Gaskets, Rubber**  
 \* Garlock Packing Co.  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.

**Gates, Blast**  
 \* Steere Engineering Co.

**Gates, Cut-off**  
 \* Easton Car & Construction Co.  
 \* Link-Belt Co.

**Gates, Sluice**  
 \* Chapman Valve Mfg. Co.  
 \* Pittsburgh Valve, Fdry. & Const. Co.

**Gear Blanks**  
 \* Cann & Saul Steel Co.

**Gear Cutting Machines**  
 \* Jones, W. A. Fdry. & Mach. Co.

**Gear Hobbing Machines**  
 \* Jones, W. A. Fdry. & Mach. Co.

**Gears, Bakelite**  
 \* Ganschow, Wm. Co.

**Gears, Cut**  
 \* Brown, A. & F. Co.  
 \* Chain Belt Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

figs. Consideration of speeds, type of machine and tool to be used.

## D

### DIESEL ENGINES

**French Installations.** Reconstructing France by Aid of Diesel Power. Oil Engine Power, vol. 2, no. 1, Jan. 1924, pp. 6-11, 9 figs. Notes on several of large Diesel plants installed during and since war; one engine is larger than any yet built in U. S. A.

**Generator Drive.** Oil-Engine Driven Ship Generators in the German Navy (Der ölmotorische Antrieb von Borddynamos in der deutschen Kriegsmarine), W. Laudahn. Schiffbau, vol. 25, nos. 6 and 8, Jan. 9 and 23, 1924, pp. 157-161 and 179-187, 2 figs. The engines of the German Gen. Elec. Co. (AEG) with 12-kw. power. Results of workshop tests. For reference to previous articles in this series see Eng. Index 1922 and 1923.

**Valve Setting.** Setting the Valves of a Diesel Engine. H. P. Birnie and R. C. Baumann. Power Plant Eng., vol. 28, no. 3, Feb. 1, 1924, pp. 180-182, 7 figs. Describes general process of valve setting.

### DRILLING MACHINES

**Rotating Tables.** Drilling Motor Parts on the Rotating Table. W. F. Sandmann. Am. Mach., vol. 60, no. 6, Feb. 7, 1924, pp. 197-199, 6 figs. Examples of rotating fixtures used on large variety of automotive work; construction of fixtures and principles involved in design.

### DROP FORGING

**Hammers.** New Type of Drop Hammer for Multiple-Die Stamping. Engineer, vol. 137, no. 3554, Feb. 8, 1924, pp. 154-155, 4 figs. Brett drop hammer fitted specially for multiple-die stamping work.

## E

### ECONOMIZERS

**High-Pressure.** Advances in Economiser Practice. Power Eng., vol. 19, no. 215, Feb. 1924, pp. 63-64, 3 figs. Describes Ringstay economizer for high-pressure work.

### ELECTRIC FURNACES

**Advantages.** Electric Industrial Heating. H. M. Drake. Engineer, vol. 137, no. 3553, Feb. 1, 1924, pp. 114-116, 4 figs. Discusses practice and experiences in America; advantages of electric heating; author advocates more extensive use of electric heating in Great Britain.

**Granular-Carbon Resistor.** Granular Carbon Resistor Furnaces. M. M. Austin. Indus. & Eng. Chem., vol. 16, no. 2, Feb. 1924, pp. 156-157, 2 figs. Describes two types in which some of disadvantages of such furnaces have been overcome and their construction simplified.

### ELECTRIC LOCOMOTIVES

**Baldwin-Westinghouse.** Baldwin-Westinghouse Electric Locomotives in South America and Japan. R. R. Barnes. Baldwin Locomotives, vol. 2, no. 3, Jan. 1924, pp. 3-18, 26 figs. Describes types employed in Chile, Argentina and Japan.

**1800-Hp. 4-6-6-4-Type.** Electric Locomotive for the Imperial Japanese Railways. Engineering, vol. 117, no. 3030, Jan. 25, 1924, pp. 97-100, 11 figs. partly on supp. plate and p. 112. Describes locomotives supplied by English Elec. Co. of 4-6-6-4 type having motor equipments of 1800 hp.

**Paris-Orleans Ry.** Epoch Making Tests on New Passenger and Freight Locomotives. W. D. Bearce. Gen. Elec. Rev., vol. 27, no. 2, Feb. 1924, pp. 98-103, 9 figs. Describes tests carried out at Erie Works of Gen. Elec. Co. on two electric locomotives, viz., Paris-Orleans passenger, and freight locomotive for Mexican Ry. Co.; principal features of locomotives.

### ELECTRIC RAILWAYS

**Public Relations.** How to Secure Better Public Relations. E. C. Hathaway. Elec. Ry. J., vol. 63, no. 4, Jan. 26, 1924, pp. 139-140. Bad treatment of utility corporations results from personal grievances of customers; public relations committee should make company better understood; its manager should take active part in civic affairs; correct attitude of employees important; securities should have wide distribution locally.

**Spain.** Progress of Electric Traction in Spain. F. A. Shepley. Elec. Traction, vol. 20, no. 1, Jan. 1924, pp. 10-17, 4 figs. Also notes on some opportunities for American manufacturers.

### ELECTRIC WELDING

**Boiler Construction and Repair.** Electric Welding for Boiler Construction and Repairs. Eng. & Boiler House Rev., vol. 37, no. 7, Feb. 1924, pp. 238-240, 2 figs. Extent to which electric welding is applicable to boilers of all types; information regarding work already carried out.

### ELECTRIC WELDING, ARC

**Precision.** Precision Welding. S. W. Mann. Coal Industry, vol. 7, no. 1, Jan. 1924, pp. 57-60, 3 figs. Describes process and method of repairing crankshaft known as neutralized precision weld.

**Ship Construction.** Applications of Arc Welding to Ship Construction. E. H. Ewertz. Mar. Eng. & Shipp. Age, vol. 29, nos. 1 and 2, Jan. and Feb. 1924, pp. 47-54 and 114-121 and 124, 4 figs. Jan.: Results of tests to determine strength of welded joints; attitude of classification societies towards application of electric welding. Feb.: Lloyd's rules and regulations for application of electric arc welding to ship construction; corrosion; bibliography.

### ELEVATED RAILWAYS

**Cars.** Passenger Comfort the Feature of the New Chicago "L" Cars. Elec. Ry. J., vol. 63, no. 2, Jan. 12, 1924, pp. 55-59, 6 figs. Describes steel motor cars recently put in service by Chicago Elevated R.R.; low first cost and maintenance; plus seats, liberal ventilation, and insulation against noise and cold; wood roof necessary for overhead trolley.

### ELEVATORS

**Passenger. Time-Velocity Characteristics.** Time-velocity Characteristics of the High-speed Passenger Elevator. Bassett Jones. Gen. Elec. Rev., vol. 27, no. 2, Feb. 1924, pp. 111-120, 5 figs. Discusses psychology of elevator passenger, physiological effect of acceleration and retardation on him, possible improvements in service through increased car velocity, quicker gate and door operation, better signal systems, and use of automatic stops; also advances method of analyzing time-velocity relations assisting in designing high-grade high-speed elevator installations.

### EMPLOYEES

**Rating Scales.** Personal Opinion Records and Rating Scales. Henry C. Link. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, pp. 78-80, 1 fig. Suggestions for simple rating system; points out value of system of recording personal opinions as substitute for or supplement to more objective production records.

### EMPLOYMENT MANAGEMENT

**Labor Distribution.** The Decimal Method of Labor Distribution. Jos. M. Schappert. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, p. 98. Advantages of decimal system over common fraction method; outline of decimal system which may be established to betterment of labor costs in almost any organization.

**Selecting Employees.** The Industrial Psychology of Individual Differences. D. A. Laird. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, pp. 71-77, 14 figs. Discusses basic facts for selecting workers.

### ENAMELING

**Automobile Fenders and Bodies.** Process of and Equipment for Fender and Body Enameling. G. Lefebvre. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 195-208, 26 figs. Improvements in mechanical equipment and processes employed in various car-assembling plants of large automobile building company, with special attention to processes for enameling fenders and sheet-metal parts and such small parts as various stampings, forgings and malleables.

**Cooking Utensils, Manufacture.** Manufacturing Enamelled Ware Utensils. F. G. White. Blast Furnace & Steel Plant, vol. 12, no. 2, Feb. 1924, pp. 124-126, 4 figs. Methods employed at Granite City factory of Nat. Enameling & Stamping Co.; quality of steel and careful annealing and pickling are essential to successful enameling of cooking utensils; removal of die lubricant. See also Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 43-45, 4 figs.

**Electric Furnaces for.** Enameling Cast-Iron Ware in Electric Furnaces. H. E. Kennedy. Chem. & Met. Eng., vol. 30, no. 5, Feb. 4, 1924, pp. 219-221, 5 figs. Advances in construction and disposition of metallic resistors have simplified use of electricity for this purpose.

**Smelters.** Types of Enamel Smelters. J. E. Hansen. Fuels & Furnaces, vol. 2, no. 2, Feb. 1924, pp. 141-144, 2 figs. Reverberatory and rotary smelters; experimental types.

### ENGINEERING

**Literature.** Engineering Literature. D. McNicol. Am. Inst. Elec. Engrs.—Jl., vol. 43, no. 2, Feb. 1924, pp. 131-135. Critical review of tendencies in technical literature, with statement of some of problems of publication.

### ENGINEERS

**Consulting.** The Costs of a Consulting Engineering Practice. Engineer, vol. 137, no. 3553, Feb. 1, 1924, pp. 113-114, 2 figs. Author points out importance of having accurate knowledge of costs of consulting-engineering practice and gives results of his own experience.

**Refrigerating, Relation to Employer.** Relation of the Engineer to His Employer. W. S. Vivian. Ice & Refrigeration, vol. 66, no. 1, Jan. 1924, pp. 12-16. Qualifications of engineer.

### ENGINEHOUSES

**Concrete Rectangular.** England's First Reinforced Concrete Enginehouse. D. R. Lamb. Ry. Age, vol. 76, no. 5, Feb. 2, 1923, pp. 327-340, 8 figs. Southern Railway completes rectangular structure of novel design at Feltham, England.

**Wiring and Lighting.** Enginehouse Wiring and Lighting on the Santa Fe. Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 13-16, 4 figs. Wires carried in lead-coated wrought-iron water pipe, and both wall and overhead-type reflectors used; threads and fittings lead-coated by wiremen.

### EVAPORATORS

**Multiple-Effect.** Designing an Efficient Evaporator. H. K. Moore. Chem. & Met. Eng., vol. 30, no. 7, Feb. 1924, pp. 274-278, 7 figs. Example of how fundamental principles underlying multiple-effect

evaporation can be applied on commercial scale to industrial materials.

**Refrigerants.** Evaporating Systems for Refrigerants. W. F. Davis. Power Plant Eng., vol. 28, no. 4, Feb. 15, 1924, pp. 250-251. Points out that evaporators should have in a measure all general qualities of good steam boiler. (Abstract.) Paper read before Nat. Assn. Practical Engrs.

## F

### FANS

**Design and Application.** Some Common Faults in Fan Design and Application. F. G. Whipp. Domestic Eng. (Lond.), vol. 43, no. 12, Dec. 1923, and vol. 44, no. 1, Jan. 1924, pp. 253-259 and 17-19, 6 figs. Discusses speed of a fan, bearings, and methods of arranging fan drives.

**Motors for.** How to Choose Motors for Driving Industrial Fans. R. H. Rogers. Chem. & Met. Eng., vol. 30, no. 6, Feb. 11, 1924, pp. 231-233, 9 figs. Notes on utility of various types of motors and control devices that are available for fan service.

**Motor Drives for Mine Fans.** F. W. Cramer. Coal Industry, vol. 7, no. 1, Jan. 1924, pp. 8-11, 4 figs. Comparison of various types of motors which may be used to drive mine fans from standpoint of efficiency, speed control, initial cost and power factor.

**Selection and Operation.** Selection and Operation of Centrifugal Fans. Chas. L. Hubbard. Power Plant Eng., vol. 28, no. 4, Feb. 15, 1924, pp. 242-244, 2 figs. Proportioning fan to its load is vital factor in securing economy; principles of fan operation; resistances and outlet velocities.

### FERROALLOYS

**Micrographic Detection of Carbides.** Micrographic Detection of Carbides in Ferrous Alloys. N. B. Pilling. Am. Inst. Min. & Met. Engrs.—Trans., No. 1289-S, Jan. 1924, 5 pp., 6 figs., also (abstract) Min. & Metallurgy, vol. 5, no. 205, Jan. 1924, p. 31. New reagent developed for micrographic analysis of silicon steels, consisting of a dilute solution of nitric acid and methyl alcohol in nitrobenzol; action differs from that of sodium picrate in that there is no persistent deep-seated staining and solution is used cold.

### FIRE EXTINGUISHERS

**Types and Proper Uses.** Fire Extinguishers and Their Proper Uses. H. L. Pagett. Fire & Water Eng., vol. 75, no. 2, Jan. 9, 1924, pp. 59-60 and 85-88. Classification of various types as to fires they are best suited to extinguish; arranged in three general classes of fires.

**First Aid Fire Appliances.** Chas. R. D'Olive. Coal Mine Mgt., vol. 3, no. 1, Jan. 1924, pp. 32-36 and 63. Describes various types of fire extinguishers.

### FIRE PROTECTION

**Sprinklers.** Some Things to Know about a Sprinkler System. C. C. Brown. Fire & Water Eng., vol. 75, nos. 3 and 5, Jan. 16 and 30, 1924, pp. 113-114, 118-119 and 134-135; and 209-210 and 232. Discusses all phases connected with proper installation and maintenance of automatic sprinklers.

**Water Curtain.** The Water Curtain as a Protection against Conflagration. M. W. McIntyre. Fire & Water Eng., vol. 75, no. 1, Jan. 2, 1924, pp. 15-16 and 34, 5 figs. Describes system in use in large building in Cincinnati, O., and method employed in testing system's efficiency.

### FIREBRICK

**Tests.** High Temperature Load and Fusion Tests of Fire Brick from the Pacific Northwest in Comparison with Other Well-Known Fire Brick. H. Wilson. Am. Ceramic Soc.—Jl., vol. 7, no. 1, Jan. 1924, pp. 34-51, 10 figs. Results of tests made on 17 samples of firebrick from Pacific Northwest with 27 other commercial brands of fireclay, silica, magnesia, chromite, zirconia, diaspore, silicon carbide and crystalline alumina, as well as china clay and crystalline sillimanite products made at Univ. of Wash.

### FLOW OF AIR

**Resistance to Falling Spheres.** The Resistance of Air to Falling Spheres. Rob. G. Lunnon. Lond., Edinburgh, & Dublin Philosophical Mag. & J. Sci., vol. 47, no. 277, Jan. 1924, pp. 173-182, 1 fig. Investigates fall of small steel balls in coal-mine shafts and gives results for dry, still air.

### FLUE-GAS ANALYSIS

**Computation.** Computations Involving Steam in Boiler Flue Gas. F. C. Evans. Combustion, vol. 10, no. 2, Feb. 1924, pp. 118-119. Discussion of method of finding loss due to moisture in coal and due to water from combustion of hydrogen; illustrated by alignment chart for use in solving equations for the purpose given in proposed Boiler Test Code of A.S.M.E.

**Interpretation of.** Interpretation of Flue Gas Analysis. F. D. Harger. Combustion, vol. 10, no. 2, Feb. 1924, pp. 115-117, 4 figs. Necessity of complete flue-gas analysis as a guide to efficient combustion, end to be obtained being highest possible percentage of CO<sub>2</sub> without formation of CO and other combustible gases. Cautions to be observed in interpreting flue-gas analysis; losses caused by escape unburned of combustible gases and relation of loss to other loss factors.

### FLYING BOATS

**Aeromarine.** The Aeromarine Metal-Hull Flying Boat. Flight, vol. 15, no. 47, Nov. 22, 1923, pp. 711-713, 12 figs. Commercial biplane; passenger capacity for flights of 4 hr. duration or under, 7; span, upper

# Manufactured by **CLASSIFIED LIST OF MECHANICAL EQUIPMENT** Alphabetical List on page 150

- De Laval Steam Turbine Co.**  
Farrel Foundry & Machine Co.  
Fawcus Machine Co.  
Foote Bros. Gear & Machine Co.  
James, D. O. Mfg. Co.  
Johnson, Carlyle Machine Co.  
Jones, W. A. Fdry. & Mach. Co.  
Link-Belt Co.  
Mackintosh-Hemphill Co.  
Medart Co.  
Northern Engineering Works  
Philadelphia Gear Works

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

wing 65 ft., lower wing 48 ft. 6 1/2 in.; length overall 32 ft. 10 in.; area of upper wing with ailerons 434 sq. ft., lower wing 218 sq. ft.; high speed (at 1700 r.p.m.) 98 m.p.h.; 400-hp. Liberty engine.

**Rohrbach.** A Rohrbach Flying-Boat. Aeroplane, vol. 26, no. 1, Jan. 2, 1924, pp. 18-19, 4 figs. Notes on all-duralumin monoplane of very similar construction to Staaken monoplanes; equipped with two Rolls-Royce Eagle IX type engines and designed to carry 12 persons; span 95 ft. 3 in., length 54 ft. 2 in.

#### FOREMEN

**Training.** A Training Program for the Foreman, J. K. Novins. Railroad Herald, vol. 28, nos. 2 and 3, Jan. and Feb. 1924, pp. 25-30 and 26-30. Outlining study course; study plan proposed by Federal Board for Vocational Education; choosing text material for foreman conferences.

#### FORESTRY

**Reforestation.** Reforestation and Timber Conservation. J. W. Blodgett. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 59-63 and 72, 7 figs. Nation-wide reforestation policy a necessity; regrowth of timber for pulpwood and low-grade material; regrowth of timber suitable for lumber; points out that reforestation for lumber purposes is task for Federal Government; benefits to be derived from Federal reforestation of logged-off lands.

**United States.** The Evolution of Forest Industries in the United States, W. B. Crealey. West. Soc. Engrs.—Jl., vol. 29, no. 1, Jan. 1924, pp. 1-12. Notes on expanding scale of lumber operations and of timber use; relations of forest industries to timberland; utilization of raw material; transportation costs and lumber prices; situation of paper industry; transportation costs and reforestation; a national forestry policy.

#### FORGING

**Collared Shaft.** Calculations in Forging a Collared Shaft, C. J. Steen. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 40-42, 10 figs. Method of calculating size of ingot and forging time; size of press and unit of forging pressure important factors.

#### FORGINGS

**Steel.** Recent Developments in Steel Forgings, J. L. Cox. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 12-16, 13 figs. Review of developments in line of forging exceptionally large machine parts; forgings often employed to advantage in place of steel castings. Paper presented before Am. Iron & Steel Inst.

#### FOUNDRIES

**Ingot Molds.** Develop Ingot Mold Foundry, Pat Dwyer. Foundry, vol. 52, no. 4, Feb. 15, 1924, pp. 125-130, 9 figs. Practice at foundry of Vulcan Mold & Iron Co., Latrobe, Pa.; in addition to solid molds made in dry sand and poured vertically, split molds are made in halves in green sand and poured horizontally.

#### FREIGHT HANDLING

**Perishable Freight.** Transportation of Perishable Freight, G. H. Nelson. West. Soc. Engrs.—Jl., vol. 29, no. 1, Jan. 1924, pp. 23-27. Describes traffic and way it is handled.

#### FUEL ECONOMY

**Railways.** Personnel in Fuel Economy, U. L. Richards. Railroad Herald, vol. 28, no. 2, Jan. 1924, pp. 31-32. Education and selection of employees. Extract from prize-winning paper in Int. Ry. Fuel Assn. contest. See also Ry. & Locomotive Eng., vol. 37, no. 1, Jan. 1924, pp. 7-12.

#### FUELS

**Research.** The Work of the Fuel Research Board, C. H. Lander. Colliery Guardian, vol. 127, no. 3291, Jan. 25, 1924, pp. 213-214. Physical and chemical survey of national coal resources; carbonization of coal; H. M. fuel research station; low-temperature and high-temperature carbonization; etc. Paper read before Midland Inst. Min. Engrs. See also Iron & Coal Trades Rev., vol. 108, no. 2910, Jan. 18, 1924, pp. 87-88.

[See also BAGASSE; COAL; COKE; OIL FUEL; PULVERIZED COAL.]

#### FURNACES, FORGING

**Heat Economy.** Heat Economy of Coal Fired Rolling and Forging Furnaces. Fuels & Furnaces, vol. 2, no. 2, Feb. 1924, pp. 119-121. Heat distribution, economy and coal consumption of various types of furnaces with brick recuperators, cast-iron recuperators and waste-heat boilers.

#### FURNACES, HEATING

**Rail-Heating.** Rails Heated for Rerolling in Stoker Fired Furnaces, Elmer C. Cook. Fuels & Furnaces, vol. 2, no. 1, Jan. 1924, pp. 27-29, 1 fig. Continuous furnaces at Sweet's Steel Co. used in recovery of oil rails.

**Oil- and Gas-Heated.** Recuperation for Oil and Gas Heated Furnaces, A. E. Walden. Gas Age-Rec., vol. 53, no. 4, Jan. 26, 1924, pp. 97-98 and 122, 3 figs. Design of industrial heating furnaces for increased economy in operation.

#### FURNACES, HEAT TREATING

**Electric.** Electric Furnaces, With Special Reference to the Heat Treatment of Steel, L. W. Wild. Eng. Production, vol. 7, no. 136, Jan. 1924, pp. 20-23, 11 figs. Discusses hardening, normalizing, annealing, tempering, and carburizing, and suitable furnaces.

**Heating Curves.** Characteristics of Heating Curves, Their Applicability for Calculating the Time Required to Reach Constant Head Temperatures, R. J. Janitzky. Am. Soc. Steel Treating—Trans., vol. 8, no. 2, Feb. 1924, pp. 201-208, 2 figs. Method of calculating time required to bring bodies of steel up to constant-head temperature of furnace.

## G

#### GAGES

**Optical.** Hilger Optical Gauges. Engineering, vol. 137, no. 3027, Jan. 4, 1924, p. 10, 3 figs. Designed during war for testing cylindrical tubes of eye-pieces of telescopes which are made in standard dimensions.

#### GAS ENGINES

**Exhaust-Gas Utilization.** Waste Exhaust-Gas and Its Utilization, V. L. Maleev. Oil Engine Power, vol. 2, no. 1, Jan. 1924, pp. 18-20, 2 figs. Details of tests carried out in connection with 160-h.p. gas engine in shops of West. Mach. Co., Los Angeles.

#### GAS HOLDERS

**Oxy-Acetylene Welding.** Gas Holder Seams Welded by Oxy-Acetylene Torch, G. O. Carter. Gas Age-Rec., vol. 53, no. 3, Jan. 19, 1924, pp. 69-72, 8 figs. Describes work on a 50,000-cu. ft. holder.

#### GASES

**Compressibility to High Pressures.** The Compressibility of Five Gases to High Pressures, P. W. Bridgman. Am. Acad. Arts & Sciences—Proc., vol. 59, no. 8, Jan. 1924, pp. 173-211, 5 figs. Results of measurements of compressibility of hydrogen, helium, ammonia, nitrogen, and argon, to pressures varying from 12,000 to 15,000 kg./cm<sup>2</sup>. References.

#### GASOLINE

**Distillation Test.** The Distillation Test of Gasoline, W. G. Clark. Natural Gas, vol. 5, no. 1, Jan. 1924, pp. 22 and 61. How actual making of test is accomplished; gasoline specifications.

#### GASOLINE ENGINES

**Radiotelegraph Equipment.** A Petrol Engine for Wireless Telegraph Equipment. Engineering, vol. 117, no. 3029, Jan. 18, 1924, p. 76, 5 figs. Describes small engines constructed by J. W. Brooke & Co.

#### GEARS

**Chucking.** Better Ways of Chucking Gears for Grinding. Can. Machy., vol. 31, no. 1, Jan. 3, 1924, pp. 21-23, 14 figs. Every care must be taken in selection of material, preparation of blanks, setting and cutting on machine, heat treatment and bore-grinding operation.

**Design.** A New Chart for the Design of Spur Gears, H. E. Merritt. Machy. (Lond.), vol. 23, no. 588, Jan. 3, 1924, pp. 457-458, 4 figs. Chart includes all variables introduced in gear-design calculations, and being composed of straight lines throughout, gives results of great degree of accuracy; will cover all possible dimensions, speeds, and stresses met with in practice.

**Gears.** Maschinenbau, vol. 3, no. 7, Jan. 10, 1924. Contains following articles: High-Grade Spur-Wheel Gear (Hochwertige Stirnradgetriebe mit Pfeilverzahnung), E. Meyer, pp. 159-163, 7 figs.; Use of Gears in the Reconstruction of Power Plants (Verwendung von Zahnradgetrieben bei Umbauten von Kraftanlagen), H. Klein, pp. 163-166, 8 figs.; Determination of Duration of Contact in Spur Gears (Bestimmung der Eingriffsdauer bei Stirnrädern), J. Dalchau, pp. 166-168, 5 figs.; Aspects for the Design of Friction Gears (Einige Gesichtspunkte für die Konstruktion von Reibungstrieben), G. Sachs, pp. 168-175, 30 figs.; Differential Gear (Differentialgetriebe), C. v. Dobbeler, pp. 175-177, 4 figs.

**Specifications.** American Stock Gearset Specifications. Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, p. 421. Specifications of different makes for passenger cars, buses, trucks and tractors.

**Worm Reduction.** Worm Gear: Its Production and Efficiency and Its Application to Turbine Reduction Gearing, F. W. Lanchester. Engineering, vol. 117, no. 3031, Feb. 1, 1924, pp. 131-132. Author is not impressed with prospects of general use of worm gear as turbine reduction gearing. Report on efficiency tests made on work and worm wheel for Daimler Co. is appended.

#### GLUES

**Casein.** Casein Glues for Automobile-Body Assembly, W. A. Henderson. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 186-187. Casein vs. animal glue; water and heat-resisting qualities.

#### GRAIN ELEVATORS

**Pneumatic.** Pneumatic Grain Elevators, W. Cramp and A. Priestley. Engineering, vol. 137, nos. 3550, 3551, 3552 and 3553, Jan. 11, 18, 25 and Feb. 1, 1924, pp. 34-36, 64-65, 89-90 and 112-113, 7 figs. Results of investigation at University of Manchester; suggests rational basis for future design. Jan. 11: Force exerted by air on grain and resulting velocities; grain velocity and air pressure. Jan. 18: Work on pneumatic conveyor and other work done by air; experimental plant used in tests of vertical pneumatic elevator. Jan. 25: Friction of grain on pipe; nozzles. Feb. 1: General method for design of plants; use of auxiliary air inlet in nozzles; application of formulas to other materials and media and to problem of horizontal conveyors.

#### GREASES

**Kinds and Uses.** The Kinds and Specialized Uses of Grease, F. A. Hobb. Oil News, vol. 12, no. 1, Jan. 1924, pp. 14-15. Account of grades and individual merits of greases.

#### GRINDING

**Wheel-Forming Fixtures.** Simplifying Form Grinding in Machine Shops, A. R. Noble. Can. Machy., vol. 31, no. 1, Jan. 3, 1924, pp. 33 and 46, 4 figs. Description of wheel-forming fixtures which

have been successfully employed for various classes of work.

#### GRINDING MACHINES

**Gear.** A Full-Automatic Gear Grinder with Adjustable Involute Control. West. Machy. World, vol. 15, no. 1, Jan. 1924, pp. 31-33, 6 figs. Describes machine used in manufacture of ground involute gears, built by Fellows Gear Shaper Co., Springfield, Vt.

**Internal.** European Abrasive Equipment, B. Schapira. Abrasive Industry, vol. 5, no. 1, Jan. 1924, pp. 24-25, 5 figs. Describes horizontal and vertical-spindle internal grinders.

## H

#### HARDNESS

**Definitions.** Definitions of Hardness, C. A. Beckett. Machy. (N. Y.), vol. 30, no. 7, Mar. 1924, pp. 503-505. Gives number of hardness definitions and methods of determining hardness, as defined or employed by various experimenters, such as wear, scratch hardness, rebound, crushing, bending, penetration, impact hardness test; time as related to hardness testing; various definitions of hardness.

#### HEAT TREATING

**Gear Blanks.** Heat Treating Gear Blanks, R. L. Manier. Fuels & Furnaces, vol. 2, no. 2, Feb. 1924, pp. 161-163, 2 figs. Automatic proportioning system used in firing normalizing and carburizing furnaces at New Process Gear Corp.

**Shop for.** Modernizes Heat Treating Shop, E. F. Ross. Iron Trade Rev., vol. 74, no. 8, Feb. 21, 1924, pp. 541-545, 6 figs. Rochester gear manufacturer installs new high-temperature continuous automatic electric furnace for hardening high-speed gear-cutting tools.

#### HEATING, HOT-WATER

**Institution Plant.** An Institution Hot-Water Plant. Power Engr., vol. 19, no. 215, Feb. 1924, pp. 57-62, 14 figs. Arrangements for warming scattered buildings, wards of average-sized institution for poor, and for supply of hot water for domestic purposes.

#### HOBBLING MACHINES

**Gear.** New Hobbling Machine Specially Designed to Rough and Finish Gears. Automotive Industries, vol. 50, no. 7, Feb. 14, 1924, pp. 347-348, 3 figs. Machine made by Gould & Eberhardt can be used for production of both spur and helical types in quantities; also adapted to diversified range of work.

**New Gear Hobber.** Iron Age, vol. 113, no. 5, Jan. 31, 1924, pp. 361-362, 3 figs. Machine for quantity production of spur and helical gears; drive arrangement a feature.

#### HYDRAULIC TURBINES

**Norway Power Station.** The Turbines at Ranaasfoss Power Station, Norway, H. Thoresen. Engineer, vol. 136, nos. 3551 and 3552, Jan. 18 and 25, 1924, pp. 60-63 and 86-88, 27 figs. partly on supp. plate. Determination of size of units and choice of type of turbine; description of turbines. Jan. 25: Efficiency tests and testing arrangements; test results.

#### HYDROELECTRIC DEVELOPMENTS

**Austria 1923.** The Status of Hydroelectric Development in Austria at the End of 1923 (Die Grosswasserkraftverwertung in Oesterreich nach dem Stande Ende Dezember 1923). Elektrotechnik u. Maschinenbau, vol. 42, no. 2, Jan. 13, 1924, pp. 20-23. Statistical data on hydroelectric plants completed and under construction, and their output.

**Canada.** Hydro-Electric Progress in Canada, 1923. Can. Engr., vol. 46, no. 4, Jan. 22, 1924, pp. 177-178. Review of principal water-power developments in Canada; works under construction or actively in prospect; about 255,000 hp. were added during year, bringing total installation to 3,228,000 hp.

**Davis Bridge Project, Vermont.** Davis Bridge Power Project to Develop 60,000 Hp., A. C. Eaton. Eng. News-Rec., vol. 92, no. 4, Jan. 24, 1924, pp. 142-146, 8 figs. New England power-system unit to produce 390,000,000 kw-hr. annually on Deerfield River; in 70 mi. 1700 ft. of head are to be utilized; major unit is 200-ft. earth dam, highest on record.

**Equipment Selection.** Hydro-Electric Development with Special Reference to the Hydraulic Equipment, W. M. White. Boston Soc. Civ. Engrs.—Jl., vol. 11, no. 1, Jan. 1924, pp. 1-16 and (discussion) 16-20, 9 figs. Present general practice governing selection of machinery for various heads.

**Italy.** Hydroelectric Plants of the Breda Company in the Lys Valley (Gli impianti della S. I. P. Breda in Valle Lys). Elektrotecnica, vol. 10, nos. 33 and 34, Nov. 25 and Dec. 5, 1923, pp. 790-800 and 813-823, 50 figs. Description of the four projects of the company, with special attention to Pont S. Martin plant, comprising two 14,000-hp. Pelton wheels operating under a head of 1700 ft.

**San Francisco, Cal.** San Francisco's Hetch Hetchy Water Supply and Power Development, M. M. O'Shaughnessy. Gen. Elec. Rev., vol. 27, no. 2, Feb. 1924, pp. 78-84, 10 figs. Describes development as a whole and explains San Francisco water situation; features of hydroelectric development; describes dam to be known as O'Shaughnessy Dam which, when completed, will be highest in world.

#### HYDROELECTRIC PLANTS

**Assembling Hydraulic Units.** Assembling Heavy Hydraulic Units in Plant at Bombay. Eng. News-Rec., vol. 92, no. 8, Feb. 21, 1924, pp. 328-329, 2 figs.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

Rotors and runners of six 10,000-kva. generating units shrunk on shafts with aid of only native labor.

**British Columbia.** Hydro-Electric Plant, Pacific Mills, Ltd., G. S. Barry. Can. Engr., vol. 46, no. 4, Jan. 22, 1924, pp. 161-162, 3 figs. New unit installed in pulp and paper mill at Ocean Falls, B. C., increases output to 15,000 hp.; consists of a 6300-hp. Pelton wheel direct-connected to a Can. Gen. Elec. generator with exciter.

**California.** Big Creek-San Joaquin Hydroelectric Project, Claude C. Brown. Power Plant Eng., vol. 28, no. 3, Feb. 1, 1924, pp. 167-172, 14 figs. Big Creek No. 3 plant, known as The Electric Giant, has three turbine units and develops total capacity of 105,000 hp. under head of 760 ft.

Largest Hydroelectric Plant in the West Placed in Service. Eng. World, vol. 24, no. 1, Jan. 1924, pp. 19-21, 6 figs. Details of Big Creek No. 3 power plant.

**Wisconsin.** Completing the Jim Falls Hydro-Electric Development, A. J. Hammond. Eng. News-Rec., vol. 92, no. 7, Feb. 14, 1924, pp. 270-272, 6 figs. Time element a controlling feature; method of combating northern winter conditions; importance of careful preliminary studies.

## I

### ICE PLANTS

**Improvements.** Improvements in Ice Plants, R. C. Doremus. Refrig. World, vol. 59, no. 1, Jan. 1924, pp. 17-20. Some of the more recent changes in practice and equipment which have simplified operation and increased efficiency. Paper read at N. A. P. R. E. Convention. See also Ice & Refrigeration, vol. 66, no. 1, Jan. 1924, pp. 35-39.

### INDICATORS

**Internal-Combustion Engines.** Low Speed Indicator Developed for High Speed Engines. Automotive Industries, vol. 50, no. 6, Feb. 7, 1923, pp. 298-299, 3 figs. Device invented by Budapest scientist traces diagram which is representative of large number of succeeding cycles in power plant; influence of sources of error is greatly reduced; device known as Juhasz indicator has been placed on market by Lehmann & Michels of Hamburg, Germany.

### INDUSTRIAL MANAGEMENT

**Cost Control by Budget.** Control through Organization and Budgets, Thos. B. Fordham and Ed. H. Tingley. Mgt. & Administration, vol. 7, nos. 1 and 2, Jan. and Feb. 1924, pp. 57-62 and 205-208. Jan. Compilation of budget. Feb.: Applying budget to industrial operations.

**Cost Information for Department Heads.** Supplying Financial and Cost Information, G. M. Pelton. Mgt. & Administration, vol. 7, no. 2, Feb. 1924, pp. 169-172. Discusses how and to what extent department heads should be supplied with financial and cost information.

**Executives' Clubs.** A Comprehensive Plan for Executives' Clubs, S. Van T. Jester. Ry. Mech. Engr., vol. 98, no. 2, Feb. 1924, pp. 79-80. Outline of principles involved and methods followed in Jester plan.

**Maintenance Work.** Analysis of Work and Responsibilities of Maintenance Engineers, D. H. Braymer. Indus. Engr., vol. 82, no. 1, Jan. 1924, pp. 10-16, 8 figs. Discusses scope of maintenance work, with comments by readers on most effective methods of organizations, division of work and assignment of duties.

**Raw-Material Control.** Extreme Variety Versus Standardization, J. H. Van Deventer. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, pp. 81-88, 15 figs. Raw-material ordering routine at Schenectady plant of Gen. Elec. Co.

**Simplification.** Just How Far Does It Pay to Go with Simplification? F. H. Montgomery. Factory, vol. 32, no. 2, Feb. 1924, pp. 153-156 and 260, 3 figs. President of Knox Hat Co. tells how plan of simplification was carried out in manufacture of soft hats.

**Superintendents, Elimination of.** Work without Superintendents, H. R. Simonds. Iron Trade Rev., vol. 71, no. 8, Feb. 21, 1924, pp. 548-550, 3 figs. 52 foremen of Massachusetts plant, employing 3000, are responsible only to general manager; experiment with simplified system proves successful.

**Tool-Crib System.** A Tool-crib System, M. L. O'Flaherty. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 428-430, 5 figs. Proper tool-crib equipment; total classification; checking out tools for production work.

### INDUSTRIAL PLANTS

**Maintenance.** Modern Maintenance of Plant and Equipment, Wm. G. Ziegler. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, pp. 99-105, 6 figs. The plant plumber, pipefitter and tinsmith, and what they mean to production.

### INDUSTRIAL RELATIONS

**Intra-Plant Relationships.** Intra-Plant Relationships and Industrial Leadership, R. H. Booth. Min. & Metallurgy, vol. 5, no. 206, Feb. 1924, pp. 67-71, 4 figs. Describes novel plan for objective presentation of business economics.

**Kansas City Rys. Plans.** Building Good Employee Relations in Kansas City. Elec. Ry. J., vol. 63, no. 2, Jan. 12, 1924, pp. 63-66, 3 figs. Principles and organization plan of employee brotherhood and representation plan which have contributed to present favorable situation in Kansas City; separate committee handles all wage matters; membership in brotherhood entirely voluntary.

**Progress in.** Progress in Industrial Relations, Chas. M. Mills. Iron Age, vol. 113, no. 4, Jan. 24,

1924, pp. 281-283. Important gains made by progressive corporations; employee representation, it is claimed, has accomplished much, but has not been perfected.

### INDUSTRIAL TRUCKS

**Electric.** American Electric Truck Specifications. Motor Transport (N. Y.), vol. 20, no. 12, Jan. 15, 1924, pp. 418-419. Specifications of different makes.

**Studies Savings Effected by Trucks.** Iron Trade Rev., vol. 74, no. 7, Feb. 14, 1924, pp. 479-481, 4 figs. Possibilities of storage-battery truck service in foundry field investigated by company manufacturing storage-battery trucks.

### INJECTORS

**Thermal Efficiency.** The Thermal Efficiency of an Injector. Sibley J. of Eng., vol. 38, no. 1, Jan. 1924, pp. 13-15. Determination of this efficiency.

### INSULATION, HEAT

**Diatomaceous-Earth Brick.** The Manufacture of an Insulating Brick From Diatomaceous Earth, C. A. Smith. Am. Ceramic Soc.—Jl., vol. 7, no. 1, Jan. 1924, pp. 52-60, 9 figs. Pulverized diatomaceous earth was blended with each of the four clays, Tennessee ball, Redford shale, Rock Hill, Tionesta, in percentages of 0, 5, 10, 15, 20, 30, 50 clay; dry pressed briquettes were made using 50 to 60 per cent water, and were burned at cones 06, 02, and 2; heat conductivity tests made upon best bodies of series.

### INSURANCE

**Social.** Workmen's Compensation and Social Insurance. Monthly Labor Rev., vol. 18, no. 1, Jan. 1924, pp. 157-161. Group-insurance plan of So. Pac. Co.; Franco-Belgian and Franco-Luxemburg conventions relating to social insurance.

### INTERNAL-COMBUSTION ENGINES

**Radiation Characteristics.** Radiation Characteristics of the Internal-Combustion Engine, Thos. Midgley, Jr. and H. H. McCarty. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 182-185, 7 figs. Presents data showing how radiation varies with changes in character of combustion; it is concluded that radiation produced during internal combustion is function of chemical reaction involved to much greater extent than are merely temperatures of gases, although these play a marked part.

[See also AIRPLANE ENGINES, AUTOMOBILE ENGINES; DIESEL ENGINES; GAS ENGINES; GASOLINE ENGINES; OIL ENGINES.]

### IRON AND STEEL

**Bibliography 1923.** Review of Iron and Steel Literature for 1923, E. H. McClelland. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 5-9. Classified list of more important books, serials and trade publications during year, with few of earlier date, not previously announced.

**Pacific Coast, U. S.** Iron and Steel on the Pacific Coast, C. E. Williams. Min. & Metallurgy, vol. 5, no. 205, Jan. 1924, pp. 23-25. Local demand and production; foreign pig iron being imported in preference to eastern United States products; raw-materials supply; smelting methods; sponge iron.

**Terminology.** Iron and Steel Terminology, H. D. Hibbard. Min. & Metallurgy, vol. 5, no. 206, Feb. 1924, pp. 77-78. Clarifies use of terms often occurring in writings on iron and steel, and suggests several new short abbreviated names for some of the things related to subject which now are indicated by phrases.

**Trade of Great Britain.** The Iron and Steel Trade in 1923. Iron & Coal Trades Rev., vol. 108, no. 2014, Jan. 4, 1924, pp. 8-17, 2 figs. District reviews, including pig-iron production, prices, iron ore, manufactured iron and steel, imports and exports, wages, by-product market, etc.

### IRON CASTINGS

**Reinforced, for Cylinders.** Reinforced Gray Iron Castings (La fonte armée). Fonderie Moderne, vol. 18, Jan. 1924, p. 16, 1 fig. Describes process employed for manufacture of automobile-engine cylinders by Belgian foundry; all parts of cylinder where porosity is frequent are provided with thin steel wall which welds closely to iron and ensures perfect tightness; by use of this method it becomes possible to cast cylinders in soft graphitic irons; same method has been employed for making high-pressure gas and liquid containers.

### IRON FOUNDRY

**Metallurgy.** History of Foundry Metallurgy. Metal Industry (Lond.), vol. 24, no. 4, Jan. 25, 1924, pp. 83-84. Traces development of basis of modern iron-foundry metallurgy, leading up to present-day opinions as to grading of pig irons.

**Problems.** Some Foundry Problems, A. H. Munday. Foundry Trade J., vol. 29, no. 387, Jan. 17, 1924, pp. 58-61 and (discussion) 61-62. Deals with melting problems, non-ferrous alloys, heat treatment of gun metal, die-casting, bell and brass founding, mold facings, high-tensile brasses, beta brass, etc. Paper read before Lond. branches of Inst. British Foundrymen and Inst. Metals.

**Thermit, Application of.** Application of Thermit in Foundry Practice. West. Machy. World, vol. 15, no. 1, Jan. 1924, pp. 29-30, 1 fig. For increasing temperature of iron and steel, and making semi-steel in ladle; use in riser; titanium thermit cans for purifying iron and steel; method of making steel castings by thermit process.

### IRON METALLURGY

**Manufacture of Pure Iron.** Commercially Pure Iron. Gas Engr., vol. 40, no. 573, Jan. 1924, pp. 4-5, 2 figs. Purification of ingot iron; danger of fracture, and resistance to corrosion.

## L

### LABOR

**Bibliography.** Publications Relating to Labor. Monthly Labor Rev., vol. 18, no. 1, Jan. 1924, pp. 206-215. List of official and unofficial publications in United States and foreign countries.

### LABOR TURNOVER

**Absentism.** Absentism Factors for Industrial Plants, J. D. Hackett. Mgt. & Administration, vol. 7, no. 2, Feb. 1924, pp. 199-203. Relative importance of absence; nature, calculation and extent of absence; absence and wages; prevention of absence; remedies.

**Reducing.** Reducing the Turnover of Labor, C. A. Walker. Iron Trade Rev., vol. 74, no. 5, Jan. 31, 1924, pp. 350-352, 4 figs. Suitable records afford basis for study of causes of labor turnover.

### LATHES

**Gap.** The Buckman 8 1/2-inch Center Lathe. Machy. (Lond.), vol. 23, no. 590, Jan. 17, 1924, pp. 511-512, 3 figs. Distinguishing feature of hollow-spindle, gap-bed lathe is novel construction of bed.

### LIGHTING

**Equipment Depreciation.** Depreciation of Lighting Equipment due to Dust and Dirt, E. A. Anderson and J. M. Ketch. Illuminating Eng.—Trans., vol. 19, no. 1, Jan. 1924, pp. 55-65 and (discussion) 65-86. Report of tests under service conditions to determine relative depreciation or loss in efficiency. Possibilities of a simple comparison standard for predicting depreciation rates in a particular installation.

**Methods.** Modern Methods of Artificial Illumination, A. L. Powell. Am. Architect, vol. 125, no. 2438, Jan. 30, 1924, pp. 133-139, 8 figs. Desirable qualities of an illuminant, desirable qualities of illumination, and discussion of standard types of equipments which have diversified applications for different classes of service.

**Nomenclature and Standards.** Recent Developments in Nomenclature and Standards. Illuminating Eng. Soc.—Trans., vol. 19, no. 1, Jan. 1924, pp. 7-16. Progress made during 1923 in revision of Illuminating Engineering Nomenclature and Photometric Standards previously prepared by I. E. S. committee and approved as American Standard by Am. Eng. Standards Committee. Presents questions for consideration on which it is desired to have discussion and advice, among which are definition of "light" and "lighting" matter of "brightness" and units to be used in measuring it, and use of term "luminaire."

**Problems.** Working with the Architect on Difficult Lighting Problems, A. D. Curtis and J. L. Stair. Illuminating Eng. Soc.—Trans., vol. 19, no. 1, Jan. 1924, pp. 43-54 and (discussion) 65-86, 15 figs. Emphasizes necessity for early consultation between architect and lighting man in planning of lighting features of a building as well as responsibility of lighting man in developing in himself an appreciation of architectural values so as to most intelligently work with his architectural colleague. Gives some specific examples of lighting problems to illustrate advantages to be derived by considering lighting as a component part of structure.

**Progress.** Progress in the Art of Illumination, A. Bishoff. Illuminating Eng. Soc.—Trans., vol. 19, no. 1, Jan. 1924, pp. 17-27. Progress made from Jan. 1, 1900 to July 31, 1923, as evidenced by number of patents granted by U. S. Patent Office. Brief discussion of more active branches is given to indicate trend of thought followed by inventors.

**Textile Mills.** Developments in Mill Lighting, R. A. Palmer. Textile World, vol. 65, no. 5, Feb. 2, 1924, pp. 419-420, 4 figs. Studies show importance of speed of vision in manufacturing operations; higher intensities being employed; effect on production and accidents; development in suspension of units which facilitates maintenance of lighting equipment.

### LOCOMOTIVES

**Development.** A Quarter Century of the Steam Locomotive, W. A. Austin. Ry. Rev., vol. 74, no. 2, Jan. 12, 1924, pp. 107-114, 24 figs. History of growth and development of the various types since introduction of first American Mogul and Atlantic types. Paper read before Pa. section of A.S.M.E.

**Diesel-Engined.** The Next Step is the "Thermo-Locomotive," J. Barraja-Frauenfelder. Ry. Mech. Engr., vol. 98, no. 2, Feb. 1924, pp. 81-85, 1 fig. Application of Diesel engine to railway work; the Sulzer thermo-locomotive.

**4-8-2.** Heavy 4-8-2 Type Southern Pacific Locomotives. Ry. Age, vol. 76, no. 6, Feb. 9, 1924, pp. 375-377, 3 figs. Designed to haul 12 passenger cars on 2-per cent grades and run 815 mi. See also Ry. Rev., vol. 74, no. 6, Feb. 9, 1924, pp. 250-256, 6 figs.

**High Pressures and Superheated Steam.** Theoretical Savings Effected by Using High Pressures and Super-Heated Steam. Ry. & Locomotive Eng., vol. 37, no. 1, Jan. 1924, pp. 12-13, 1 fig. Analysis of heat required to produce various steam pressures and temperatures of superheat. Chart giving comparison of B.T.U. values of characteristics of saturated and superheated steam at different pressures and temperatures.

**Internal-Combustion.** The "Still" System Internal Combustion Locomotive. Ry. & Locomotive Eng., vol. 37, no. 1, Jan. 1924, pp. 14-15. Notes on new development by Still Engine Co.; 2-6-2 type.

**Long Runs.** Long Locomotive Runs on the Norfolk & Western Ry. Ry. Rev., vol. 74, no. 5, Feb. 2, 1924, pp. 203-207, 8 figs. Account of experience in developing practice of locomotive runs in passenger service over multiple divisions; special reference is made to type of locomotive which made these runs

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

possible, and details are given of construction of tenders whose increased capacity was essential feature.

**Mikado.** Mikado Type Locomotive, Canadian National Rys. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 12-16, 7 figs. Description of 45 engines designed largely to Can. Nat. standards especially for conditions in western Canada; cylinders 27 in. by 30 in. diam. driving wheels 63 in. diam.; boiler pressure 185 lb.; tractive power 54,600 lb. without booster and 65,000 lb. with.

**Tire-Flange Welding.** Welding Locomotive Tires. Ry. & Locomotive Eng., vol. 37, no. 1, Jan. 1924, pp. 21-23, 7 figs. Details of investigation made to determine effect on strength of material produced by local heating when building up worn tire flanges by either gas or electric process of welding.

**2-10-2.** Heavy Santa Fe Locomotives for B. & O. Ry. Age, vol. 76, no. 7, Feb. 16, 1924, pp. 413-414, 2 figs. Tractive force of 84,260 lb. obtained with 64-in. drivers; tenders of unusual capacity facilitate long runs.

Heavy 2-10-2 Type Locomotives for Baltimore and Ohio. Railroad Herald, vol. 28, no. 2, Jan. 1924, pp. 20-21, 1 fig. Cylinders 30 by 32 in.; driving wheels 58 in. diam.; tractive effort 84,260 lb. See also Ry. & Locomotive Eng., vol. 37, no. 1, Jan. 1924, pp. 19-20, 1 fig.; and Ry. Mech. Engr., vol. 98, no. 2, Feb. 1924, pp. 73-76, 4 figs.

**Types Built in 1923.** Locomotives. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 52-63, 30 figs. Types ordered by Class I railroads in 1923, and principal dimensions and illustrations of representative types.

**Velocity Profiles.** The Preparation and Use of Velocity Profiles, V. I. Smart. Ry. Rev., vol. 74, no. 5, Feb. 2, 1924, pp. 209-215, 7 figs. Tractive effort, coal consumption, and running time may be obtained graphically from velocity profiles, prepared in accordance with principles laid down by Am. Ry. Eng. Assn.

#### LUBRICATING OILS

**Steam-Turbine.** Maintaining Quality of Steam Turbine Oils in Service, C. H. Bromley. Power, vol. 59, no. 4, Jan. 22, 1924, pp. 125-128, 6 figs. Principal factors in recent development of information and equipment as related to maintaining quality of lubricating oils in use in steam turbines.

#### LUBRICATION

**Journal.** A Graphical Study of Journal Lubrication, H. A. S. Howarth. Mech. Eng., vol. 46, no. 2, Feb. 1924, pp. 77-79 and (discussion) 79-80, 10 figs. Visualizes characteristics of oil film and pressures within it for journal completely surrounded by its bearing; influences of clearance and viscosity upon journal friction are quantitatively shown by means of chart that can readily be used for designing bearings, (Abstracted.)

**Tools.** Tool Engineering, A. A. Dowd and F. W. Curtis. Am. Mach., vol. 60, no. 4, Jan. 24, 1924, pp. 135-137, 3 figs. Use and importance of cutting lubricants; proper application of coolant to tool and work; lubricating milling cuts; value of lubricants in thread cutting.

## M

#### MACHINE SHOPS

**Ford Motor Co., Canada.** New Machine Shop for Ford Motor Co. Can. Engr., vol. 46, no. 7, Feb. 12, 1924, pp. 223-225, 3 figs. Covers 15 acres and is 1088 ft. by 570 ft. wide; a one-story sawtooth monitor type of building with a clear height under trusses of 14 ft. and with two longitudinal and one cross cranes.

#### MACHINE TOOLS

**Cone-Pulley Drives.** The Design of Cone Pulley Drives, S. Odegaard. Am. Mach., vol. 60, no. 7, Feb. 14, 1924, pp. 245-247, 1 fig. Useful tables for quick computation; design of back gearing; belt width and horsepower; design of drive for 24-in. lathe as example.

**Defects in.** Some Suggestions for Builders and Users of Machine Tools, Thos. Nadin. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 134-135. Points out simple and obvious defects in many present-day production machine tools and offers constructive suggestions for their elimination.

**Plate and Bar-Working.** Plate and Bar-working Tools, Machy. (Lond.), vol. 23, no. 588, Jan. 3, 1924, pp. 450-454, 9 figs. Plate edge planers; frame plate slotting and milling machines.

**Safety Tapping Mechanisms.** Mechanisms for Preventing Tap Breakage, A. Pestel. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 424-426, 6 figs. Deals with more important problems involved in designing safety tapping mechanisms, and methods suggested for overcoming difficulties encountered with certain mechanisms developed for this work.

#### MACHINERY

**Czechoslovakian Industry.** The Cost of Nationalism in Czechoslovakia, H. Obermeyer and A. L. Greene. Am. Mach., vol. 60, no. 8, Feb. 21, 1924, pp. 291-294, 3 figs. Present condition of machine industry; results of economic policy; discrimination in favor of Czech industrialists; domestic field in machinery.

**Guards for.** Construction of Machinery Guards, Nat. Safety News, vol. 9, no. 1, Jan. 1924, pp. 43-53, 14 figs. Materials suitable for guard construction; machine tools needed for fabrication of guards; detailed guard features; specifications for guards; guard standards.

#### MAGNESIUM

**Foundry Practice.** Explains Use of Magnesium,

H. J. Maybrey. Foundry, vol. 52, no. 3, Feb. 1, 1924, pp. 96-99, 3 figs. Peculiarities of metal which readily can be handled by foundryman are pointed out; features of molding and design, and means of avoiding defective castings. Paper presented at Int. Foundrymen's Congress.

#### MANUFACTURING

**Simplification.** Economic Progress of Simplification, E. W. McCullough. Iron Age, vol. 113, no. 4, Jan. 24, 1924, pp. 285-287. More than five-sixths of number of varieties formerly used have been eliminated in some industries; help of trade associations.

#### MATERIALS

**Limit of Elasticity.** The Static and Dynamic Elastic Limit in Material Testing and Construction (Die statische und dynamische Elastizitätsgrenze im Materialprüfungs- und Konstruktionswesen), G. Welter. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 1, Jan. 5, 1924, pp. 9-11, 3 figs. Points out necessity for reform in material-testing practice and makes plea for detailed investigation of statically and dynamically true limit of elasticity of all structural materials, in order to keep pace with requirements of modern machinery construction.

#### MATERIALS HANDLING

**Automobile Plants.** Flexibility in Handling Production Material, A. A. Brown. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 148-150. Routing and handling materials through receiving department; stocking of materials; service-department requirements; shortage report and its significance; stock records.

Material Handling is Cut to Minimum in Jewett Assembly Plant, W. L. Carver. Automotive Industries, vol. 50, no. 6, Feb. 7, 1924, pp. 281-288, 10 figs. Facilities for straight-line material flow and elimination of burdensome handling incorporated in new assembling plant of Paige-Detroit Motor Car Co.

**Factories.** Receiving, Storing and Issuing Factory Material, P. M. Atkins. Indus. Mgt. (N. Y.), vol. 67, no. 2, Feb. 1924, pp. 120-126, 9 figs. Explains fundamentals which govern working out of practical system for any given set of conditions.

#### METALS

**Cold Working.** Effect of Severe Cold Working on Scratch and Brinell Hardness, H. S. Rawdon and W. H. Mutchler. Am. Inst. Min. & Met. Engrs.—Trans., No. 1291-N, Jan. 1924, 11 pp. 7 figs., also (abstract) Min. & Metallurgy, vol. 5, no. 205, Jan. 1924, p. 31. Results obtained when a series of metals, copper, iron, tin, etc., were cold rolled to a definite degree without any intermediate annealing and hardness determined by both scratch and Brinell methods.

**Failure.** Premature Failure of Metal Parts While in Use and Methods of Prevention (Le rotture accidentale dei materiali metallici in opera ed il modo di prevenirla), P. Porcella. Elettrotecnica, vol. 10, no. 28, Oct. 5, 1923, pp. 672-676, 37 figs. Deals with failures due to violent shock, forces greater than calculated, excessive use, heating to unusual temperatures, etc.

**Strength.** Cross-Relations of Strengths of Metals in Tension, Compression, Torsion and Transverse Loading, G. B. Upton. Sibley Jl. of Eng., vol. 38, no. 1, Jan. 1924, pp. 2-6, 2 figs. Underlying relationships of strengths of materials under various kinds of loading; proper criteria of failure to apply to different kinds of metal in different places; reasons why specification of tension properties of a metal has been and will continue to be so satisfactory in insuring properties desired, whatever kind of loading is applied in actual structure.

**Uses.** New Uses for Metals. Metal Industry (N. Y.), vol. 22, nos. 1 and 2, Jan. and Feb. 1924, pp. 1-4 and 55, 3 figs. Symposium containing following articles: Researching the Field of Brass and Copper Consumption, W. A. Willis; Development of Zinc, S. S. Tutthill; New Uses of Lead and Tin, G. O. Hiers; Aluminum; New Uses and Applications of Nickel and Its Products, E. A. Turner and R. L. Suhl; Miscellaneous Metals, A. Bregman.

#### MICROSCOPES

**Portable.** Portable Microscope, Iron Age, vol. 113, no. 5, Jan. 31, 1924, p. 371, 4 figs. New type for use on metal in shop; applicable to various shapes.

#### MILLING MACHINES

**Duplex Head.** Duplex Head Milling Machine, Machy. (Lond.), vol. 23, no. 591, Jan. 24, 1924, pp. 554-555, 2 figs. Developed to meet requirements of manufacturers for either slab or face-milling operations.

**Tool Fixtures.** The Standardization of Tool Fixtures for Milling Machines (Die Normung der Werkzeugbefestigung an Fräsmaschinen), G. Schlesinger and K. Hegner. Werkstattstechnik, vol. 18, no. 1, Jan. 1, 1924, pp. 1-3, 9 figs. Recommendations for standardization of toolholders by standards committee of Assn. German Machine-Tool Builders.

#### MOLDING METHODS

**Green-Sand.** Green Sand Moulding, J. D. Nicholson. Foundry Trade Jl., vol. 29, no. 387, Jan. 17, 1924, pp. 54-55 and (discussion) 55-57, 8 figs. Discusses essential operations, using an Erith loam sand, and defects produced if such operations are not carried out in a definite manner.

**Propellers.** Sweeps a Differential Pitch, J. Edgar. Foundry, vol. 52, no. 2, Jan. 15, 1924, pp. 51-52, 7 figs. Describes characteristics peculiar to propellers in which pitch varies from that of a true screw; method employed in foundry to make mold.

#### MOLDING MACHINES

**Brass-Foundry Practice.** Molding Machine Practice, N. F. Flanagan. Metal Industry (N. Y.), vol. 22, no. 1, Jan. 1924, pp. 5-6. How molding machine is put to work in brass foundry; discusses core making, mold making, fast molding, and molding board sizes.

#### MOLDS

**Hardness Testing Apparatus.** A Hardness Testing Apparatus for Moulds and Cores, L. Treuheit. Foundry Trade Jl., vol. 29, no. 387, Jan. 17, 1924, pp. 50-51, 3 figs. Describes horizontal and vertical mold-testing devices designed similarly to Brinell testing machine to determine hardness of molds and cores in gr./mm.<sup>2</sup> to obtain a real supervision of all parts, and thereby insure clean castings with a reduction in wasters. From paper read before Hamburg Conference of German Foundrymen.

#### MOTOR BUSES

**Body Construction.** Body Construction Shows Many New Ideas, C. Gordon. Bus Transportation, vol. 3, no. 1, Jan. 1924, pp. 17-22, 17 figs. Classification into service types becoming more distinct; importance of appearance as merchandising well recognized; widespread popularity of sedan-type coach; ways to improve appearance of bodies; progress in structural details and fittings.

**Chassis Developments.** Refinements Mark Chassis Development, R. E. Plimpton. Bus Transportation, vol. 3, no. 1, Jan. 1924, pp. 9-14, 4 figs. Review of progress made during 1923.

**Double-Deck.** The Double-Deck Motor Omnibus, R. W. Meade. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 209-216. London's experience with early motor buses; London motor-bus specifications, and post-war development; double-deck buses on European continent; early bus operation in New York City; expansion to other cities and improvements in equipment; controlling factors for future design.

**Electric-Railway-Operated.** Extent and Kind of Bus Operation by Electric Railways, Elec. Ry. Jl., vol. 63, no. 1, Jan. 5, 1924, pp. 5-13. Summary of methods, of 121 companies based on nation-wide survey of industry; feeder service is most common form of operation; great expansion planned for 1924.

**Field and Future.** The Field and Future of the Motorbus, J. A. Emery. Soc. Automotive Engrs.—Jl., vol. 14, no. 2, Feb. 1924, pp. 107-110. Relation of buses to railroads on routes not served by railroads, as adjunct to railways; substitute for unprofitable railway lines.

**London Gen. Omnibus Co.** Worm Driven Cranked Axle is Novel Feature of Latest L. G. O. Bus, M. W. Bourdon. Automotive Industries, vol. 50, no. 4, Jan. 24, 1924, pp. 184-188, 5 figs. Final reduction by internal gear and pinion running in oil; pressed steel frame has one pronounced drop back of engine and another aft of rear axle; rubber buffers used to supplement springs.

**Specifications.** Current Specifications of Gasoline Motor Buses, Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, pp. 416-417. Specifications of different makes.

#### MOTOR-TRUCK TRANSPORTATION

**Freight Traffic.** Utilizing the Motor Truck in Freight Traffic, Ry. Age, vol. 76, no. 5, Feb. 2, 1924, pp. 319-323, 7 figs. Contains following articles: Pennsylvania Installs 204 Miles of Motor Truck Service During 1923, R. S. Hurd; and English Store Door Delivery Practice, F. C. Horner.

#### MOTOR TRUCKS

**Axles.** Machining Sheldon Truck Axles, F. H. Colvin. Am. Mach., vol. 60, no. 8, Feb. 21, 1924, pp. 275-277, 8 figs. Some of the special machines and fixtures used in machining both front and rear axles by Sheldon Axle & Spring Co., Wilkes-Barre, Pa.

**Glasgow Show.** Transport Vehicles at the Scottish Show, Motor Transport (Lond.), vol. 38, no. 987, Jan. 28, 1924, pp. 104-110, 12 figs. Review of passenger and goods-carrying vehicles exhibited at Glasgow show, Jan. 25-Feb. 2, 1924.

**Morris.** A Morris One-Tonner, Motor Transport (Lond.), vol. 38, no. 987, Jan. 28, 1924, pp. 96-98, 5 figs. Four-cylinder engine, with 75-mm. bore and 102-mm. stroke; wheelbase 10 ft. 2 in.

**Specifications.** Current Specifications of Gasoline Trucks, Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, pp. 409-414. Specifications of the different makes of trucks of from 1/4 tons and under to 5 tons and over.

**Steam.** The "Sentinel" Steam Wagon, Indus. Management (Lond.), vol. 11, no. 2, Jan. 24, 1924, pp. 51-53, 4 figs. Particulars of Super-Sentinel and the various types of bodies built for different kinds of work.

## N

#### NICKEL STEEL

**Carburization.** Heat-Treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 23, no. 588, Jan. 3, 1924, pp. 446-449. Carburization of nickel steels.

## O

#### OIL ENGINES

**British Industry.** The British Heavy-Oil Engine Industry—Record of 1923. Gas & Oil Power, vol. 19, no. 220, Jan. 3, 1924, pp. 59-60. Notes on developments in hot-bulb, high-compression, and Diesel engines.

# Manufactured by Advertisers CLASSIFIED LIST OF MECHANICAL EQUIPMENT (Alphabetical List on page 150)

**Punches and Dies**

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**High-Compression.** High Compression Oil Engines in Theory and Practice. Power Engr., vol. 19, nos. 214 and 215, Jan. and Feb. 1924, pp. 13-15 and 49-51, 6 figs. Jan.: Recent designs and new developments that may be expected. Feb.: Practical matters affecting erection and operation.

**Hydraulic Couplings.** Marine Oil Engine Gearing. Times Trade & Eng. Supp., vol. 13, no. 284, Dec. 15, 1923, p. 342, 1 fig. Describes system advocated by Vulcan Works, Hamburg, of interposing hydraulic coupling between engine and tooth reduction gearing.

**Roller-Bearing Hot-Bulb.** A Roller Bearing Oil Engine. Engineer, vol. 137, no. 3552, Jan. 25, 1925, pp. 92-94, 5 figs. Describes Richards hot-bulb engine, fitted with roller-type bearings throughout.

**Scavenging, Upflow-Valve.** Uniflow Valve Scavenging of Two-Stroke-Cycle Engines, R. Matthews. Power, vol. 59, no. 59, Feb. 5, 1924, pp. 208-209, 4 figs. Obtaining air and fuel mixing; solid injection for high speeds; external mixing.

#### OIL FUEL

**Burners.** Correct Methods of Using Fuel Oil, H. A. Anderson. Iron Age, vol. 113, no. 7, Feb. 14, 1924, pp. 518-519. Analysis of four types of oil burners, three types of furnaces and combinations of furnaces with burners. Address before Southern & Southwestern Ry. Club.

**Domestic Oil Burning.** L. B. French. Sheet Metal Worker, vol. 15, no. 1, Feb. 1, 1924, pp. 10-11 and 28. Future of domestic oil burner covering oil-storage facilities, automatic controls and principles of operation.

**Measuring Oil Burner Steam Consumption.** F. A. Rothwell. Power Plant Eng., vol. 28, no. 3, Feb. 1, 1924, pp. 175-176, 5 figs. Points out that orifice manifold for measuring steam consumption can easily be made in plant.

**Efficient Utilization.** Power Plant Management, Rob. June. Elec. Light & Power, vol. 2, no. 2, Feb. 1924, pp. 58, 60, 62 and 79, 2 figs. Efficient utilization of fuel oil.

**Locomotive, Storage and Distribution of.** Typical Layouts for Storage and Distribution of Fuel Oil, Including Fuel Oil Stations between Terminals. Am. Ry. Eng. Assn.—Bul., vol. 25, no. 260, Oct. 1923, pp. 66-65, 9 figs. Discusses unloading facilities, storage, delivery, and heating. Tabulation of replies from 14 oil-using railways to a questionnaire covering general features of design of facilities for handling, storage and delivery of fuel oil; representative layout and detail plans of such facilities.

#### OPTICAL INSTRUMENTS

**Developments, 1923.** Review of Optical Instrument Progress of the Past Year. English Mechanics, vol. 99, no. 3069, Jan. 18, 1924, pp. 8-10, 8 figs. Account of few of more typical developments of 1923.

#### OXY-ACETYLENE WELDING

**Applications.** Construction, Reclamation and Destruction. Iron & Steel of Canada, vol. 7, no. 1, Jan. 1924, pp. 13-16, 8 figs. Typical uses of oxy-acetylene torch.

**Freight-Yard Repairs.** Welding and Cutting in Freight Yard Repairs, H. W. L. Porth. Ry. Mech. Engr., vol. 98, no. 2, Feb. 1924, pp. 88-90, 4 figs. Parts that may be needed, procedure to be followed, precautions that should be taken; scope for cutting.

**Rotary Kilns and Coolers.** Largest Oxy-Acetylene Welded Equipment Ever Built, R. R. Orwig. Acetylene J., vol. 25, no. 7, Jan. 1924, pp. 325-328, 6 figs. Experiences in oxy-acetylene welding of 8-ft. by 125-ft. rotary kilns and 5-ft. by 50-ft. coolers, installed at plant of Union Carbide Co., by Reeves Bros. Co. of Alliance, Ohio.

#### OXYGEN

**Liquefaction Production Process.** Economical Plant for Producing Oxygen by the Liquefaction Process, A. G. Wikoff. Chem. & Met. Eng., vol. 30, no. 5, Feb. 4, 1924, pp. 181-184, 5 figs. Describes process and points out its economic advantages.

#### OXYGEN CYLINDERS

**Manufacture.** The Manufacture of "Shelby" Seamless Steel Cylinders, J. L. Smith. Acetylene J., vol. 25, no. 7, Jan. 1924, pp. 329-332, 9 figs. Details of "cupping" method for manufacture of oxygen cylinders, accessory of oxy-acetylene welding and cutting equipment.

**Oxygen Regulators.** Design and Construction of Gas Regulators, E. L. Mills. Acetylene J., vol. 25, no. 7, Jan. 1924, pp. 336-340, 6 figs. Deals with devices for regulating pressure and volume of gas in cylinder (as used by oxy-acetylene and oxy-hydrogen industries) up to torch.

## P

#### PATTERNMAKING

**Electrodeposition in.** Making Metal Patterns by Electro-Deposition, W. J. Reardon. Metal Industry (Lond.), vol. 24, no. 3, Jan. 18, 1924, p. 55, 2 figs. Method of procedure.

#### PIGMENTS

**Lithopone.** Record of Experiments in Testing the Light-Resistance of Lithopone, H. A. Gardner and P. C. Holdt. Paint Mfrs.' Assn. of U. S.—Sci. Section, circular no. 194, Jan. 1924, pp. 174-205, 11 figs. Effect of acidity of varnish and oil.

#### PIPE

**Strength and Stiffness Determination.** Charts

for Bars and Pipe in Torsion, F. Szabo. Am. Mach., vol. 60, no. 8, Feb. 21, 1924, pp. 279-282, 2 figs. Two charts making possible rapid solution of problems dealing with round bars and pipe in torsion, for determining strength and stiffness or angle of twist.

#### PIPE COVERINGS

**Tests.** Commercial Efficiency of Single and Graded Steam Pipe Coverings. Heat & Vent. Mag., vol. 21, no. 1, Jan. 1924, pp. 48-52, 6 figs. Results of recent tests on magnesia, air cell, asbestos, carocel, non-pareil, sponge felt and multiply types, conducted at State College of Wash. and reported in Eng. Bul. No. 12 by H. J. Dana.

#### PISTON RINGS

**Machining.** Machining Piston Rings on a Production Basis, H. P. Armson. Can. Machy., vol. 31, no. 4, Jan. 24, 1924, pp. 13-16, 3 figs. Comparison of casting methods with a description of process employed by a Toronto plant in manufacturing rings for automotive industry.

**Manufacture of Special Piston Rings.** West. Machy. World, vol. 15, no. 1, Jan. 1924, pp. 15-17, 9 figs. Shop methods and some of the special fixtures used by M. & H. Piston Ring Co. of Oakland, Cal., in manufacture of special rings for automobiles, trucks and tractors.

#### PISTONS

**Machining.** Machining Pistons and Other Contract Work, H. P. Armson. Can. Machy., vol. 31, no. 3, Jan. 17, 1924, pp. 17-20, 3 figs. Describes method of Allatt Machine & Tool Co., Toronto, of machining cast-iron automotive engine pistons accurately and economically; salvaging worn cams by recutting raceways for larger rollers.

#### PNEUMATIC TOOLS

**Storage and Handling.** Pneumatic Tool Service. Machy. (Lond.), vol. 23, no. 589, Jan. 10, 1924, pp. 480-483, 14 figs. Methods of storage; handling out and receiving tools.

#### POLISHING

**Firearms.** Polishing Firearm Parts. Machy. (Lond.), vol. 23, no. 591, Jan. 24, 1924, pp. 558-562, 15 figs. Notes on polishing rifle receivers, barrels, and pistol parts.

#### PRESSES

**Inclinable Power.** Design of Inclinable Power Presses, P. A. Friedell. Machy. (N. Y.), vol. 30, no. 6, Feb. 1924, pp. 442-445, 4 figs. Proportioning mechanical knockout, legs, and inclining mechanism for power press.

**Manufacture.** Making Power Presses for Quantity Production, H. P. Armson. Can. Machy., vol. 31, no. 5, Jan. 31, 1924, pp. 13-17, 3 figs. Description of methods employed in plant of Brown, Boggs Co., Hamilton, Can., with particular reference to inclinable type.

#### PRINTING MACHINES

**Rolls, Drilling.** Deep-Hole Drilling in Large Lathes. Iron Age, vol. 113, no. 6, Feb. 7, 1924, pp. 419-421, 7 figs. Success in drilling printing-machine rolls attributed to boring bar; describes machining of rolls; special milling attachments developed.

#### PRODUCER GAS

**Hydrogen in.** Determination of Hydrogen in Producer Gas, Fuels & Furnaces, vol. 2, no. 2, Feb. 1924, pp. 167-168. Percentage of hydrogen in gas serves as guide in successful producer operation; thermal conductivity of hydrogen used as basis for its continuous physical analysis.

#### PULLEYS

**Machining.** Machining Pulleys on a Big Production Basis, A. E. Granville. Can. Machy., vol. 31, no. 6, Feb. 7, 1924, pp. 27-30, 13 figs. Methods employed by different shops to expedite work vary in accordance with equipment available and ideas of men in charge.

#### PULVERIZED COAL

**Boiler Furnaces.** Burning Pulverized Fuel. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 87-92, 12 figs. Application of powdered fuel to boiler furnaces (steam-power stations), and reasons for installing the system.

**Locomotive Shop.** Powdered Coal for Locomotive Shop, Chas. Longenecker. Iron Age, vol. 113, no. 8, Feb. 21, 1924, pp. 565-569, 6 figs. Distributed to substations and thence to individual furnaces; special design necessary for forge-furnace temperatures.

**Open-Hearth Furnaces.** Pulverized Coal for Open-Hearth Furnaces, W. H. Fitch. Iron Age, vol. 113, no. 7, Feb. 14, 1924, pp. 521-522. Comparisons with producer gas and fuel oil; use in air and regenerative furnaces and soaking pits.

#### PUMPING PLANTS

**Oil-Engine-Driven Generators.** Cutting Pumping Costs with Oil Engine Driven Generator, A. L. Greene. Fire & Water Eng., vol. 75, no. 5, Jan. 30, 1924, pp. 207-208 and 224-225, 5 figs. Particulars of new water-works plant at Gloucester, N. J., having motorized pumps with Diesel-engine-driven generators furnishing motive power; reasons for installing motorized pumps; conditions governing use; summary of advantages gained.

**Water Works.** The Somerford Pumping Station, South Staffordshire Waterworks Company, F. J. Dixon. Engineering, vol. 117, no. 3031 and 3032, Feb. 1 and 8, 1924, pp. 155-157 and 187-189, 10 figs. Pumping plant consists of 4-cylinder Sulzer Diesel engine, driving vertical-spindle centrifugal borehole pump; details of plant and auxiliaries. (Abstract.) Paper read before Instn. Water Engrs.

#### PUMPS

**Drainage.** Double-inlet Drowned Drainage Pumps. Engineer, vol. 136, no. 3550, Jan. 11, 1924, p. 52, 2 figs. Describes large drainage pumps manufactured for Renala irrigation scheme of Indian Government.

**Mine, Metals for.** Metals Used in Mine Pumps, G. A. Drysdale. Min. Congress J., vol. 10, no. 1, Jan. 1924, pp. 47-49. Relative value of their resistive properties.

## R

#### RAILS

**Conductor, Under-Contact Type.** Under-Contact Conductor Rails. Electrician, vol. 92, no. 2381, Jan. 4, 1924, pp. 10-11, 7 figs. Describes new design giving complete protection for high-tension traction.

**Welding.** Manganese Special Work Welding, E. J. Shuler. Elec. Traction, vol. 20, no. 1, Jan. 1924, pp. 32-33, 4 figs. Progress in welding of manganese special work, such as solid manganese crossings, frogs and switch tongues, and manganese insert work, on lines of New Orleans Public Service Co.; shows many economies.

#### RAILWAY EQUIPMENT

**Progress in 1923.** Manufacturers Make Noteworthy Progress in 1923. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 85-93, 28 figs. Brief description of outstanding achievements of equipment builders; coaling stations, cranes and ditchers, water valves, tractors and trailers, motor cars, and machine tools.

#### RAILWAY MANAGEMENT

**Forecasting Traffic.** Forecasting Future Volume of Railway Traffic, J. B. Blood. Ry. Age, vol. 76, no. 6, Feb. 9, 1924, pp. 369-371, 3 figs. View presented on basis of mathematical study that recent estimates are not large enough.

#### RAILWAY MOTOR CARS

**Double-Truck.** A Double-Bogie Petrol Rail Car. Engineer, vol. 137, no. 3554, Feb. 8, 1924, pp. 152-153, 3 figs. Narrow-gauge car built by Drewry Car Co. for Barbados Government Ry.

**Gasoline.** Canadian National High Power Motor Coach. Ry. Age, vol. 76, no. 5, Feb. 2, 1924, pp. 329-330, 4 figs. Seats 55 passengers; driven by 225-hp. Sterling motor; built by Nat. Steel Car Corp.

**Specifications.** American Gasoline Rail Car Specifications. Motor Transport (N. Y.), vol. 29, no. 12, Jan. 15, 1924, pp. 418-419. Specifications of different makes.

#### RAILWAY OPERATION

**Expense Classification.** The Proposed Operating Expense Classification. Ry. Age, vol. 76, no. 5, Feb. 2, 1924, pp. 325-328. Tentative revision of classification circulated by Bur. of Accounts of Interstate Commerce Commission.

**Train Control.** G. R. S. Train Control Demonstrated on C. & N. W. Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 25-26, 6 figs. Results of actual service test made by Chicago & North West between West Chicago, Ill., and Fortis (Elgin), showing practicability of Gen. Ry. Signal Co.'s system of intermittent inductive tapered train control.

**Miller Train Control Stop and Speed Equipment.** Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 17-19, 3 figs. Describes equipment as in service on Chicago & Eastern Illinois; pneumatic manual release positive stop valve to be mounted outside locomotive cab, and reversing mechanism to give proper protection for either forward or backward movements among recent developments.

**Progress on Automatic Train Control.** Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 75-76. Résumé of what has been accomplished to date, and prospect for 1924.

**Train Control in Service on the Rock Island.** Ry. Elec. Engr., vol. 15, no. 1, Jan. 1924, pp. 5-10, 5 figs. Describes Regan Safety Devices Co. automatic train control system, intermittent ramp contact type, with speed control, installed on double-track main line of Chicago Rock Island & Pacific between Blue Island (Chicago), Ill., and Rock Island, in compliance with Interstate Commerce Commission's order. See also Ry. Signaling, vol. 17, no. 1, Jan. 1924, pp. 9-13, 5 figs.

#### RAILWAY REPAIR SHOPS

**Car, Scheduling System.** Systematic Car Repair Work at Kent, Ohio, G. W. Armstrong. Ry. Rev., vol. 74, no. 3, Jan. 19, 1924, pp. 133-136, 8 figs. Description of system of scheduling car-repair work in Kent, Ohio, car shops of Erie Ry.

**Chicago Burlington & Quincy R. R.** Burlington's New Shops Greatly Increase Facilities. Ry. Rev., vol. 74, no. 1, Jan. 5, 1924, pp. 64-73, 17 figs. Chicago, Burlington & Quincy R. R. has constructed a \$3,000,000 repair plant at Utah Junction, near Denver, Col., to care for all heavy repairs on its western lines as well as for those of Colorado & Southern. Describes principal buildings erected as a preliminary unit, viz., machine and erecting shop, boiler shop, blacksmith shop, power plant, storehouse and oil house. See also Ry. J., vol. 30, no. 1, Jan. 1924, pp. 22-26, 8 figs.

**Street-Car.** Repair Shops at Bathurst St., Toronto. Can. Engr., vol. 46, no. 1, Jan. 1, 1924, pp. 101-104, 5 figs. Description of new shops being built at Hillcrest by Toronto Transportation Commission; plant includes repair, assembly and subsidiary shops, large stores building, boiler house, office building, etc.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**RAILWAY SHOPS**

**Tire-Heating Plant.** Electric Tyre Heating Plant at the Acton Works of the Metropolitan District Railway Company. *Tramway & Ry. World*, vol. 55, no. 3, Jan. 17, 1924, pp. 17-19, 6 figs. Comprises two Oerlikon tyre heaters, each having rating of 60 kva.; heaters consist of a transformer with a single primary winding. Describes installation and its operation.

**RAILWAY SIGNALING**

**Automatic Block.** Signal and Interlocking Construction Shows Nice Increase. *Ry. Signaling*, vol. 17, no. 1, Jan. 1924, pp. 17-30, 1 fig. Automatic train control, economics of signaling and remote operation of switches received marked attention in 1923. Tables giving automatic block signals and interlocking plants installed during 1923, under construction Jan. 1, 1924, and contemplated for 1924.

**Single-Line Switching-Out.** Switching-Out Single-Line Token Instruments. *Ry. Gaz.*, vol. 40, no. 4, Jan. 25, 1924, pp. 107-110, 6 figs. Describes simple means by which any number of intermediate single-line token stations may be switched out at times when traffic is light, and indicates in particular, how this has been effected on Lond. Midland & Scottish Ry.

**RAILWAY TIES**

**Preservative Treatment.** The Financial Aspect of Tie Preservation. H. S. Sackett. *Ry. Age*, vol. 76, no. 7, Feb. 16, 1924, pp. 423-424. Analysis of economy of protecting timber against decay and returns from treatment.

Wood Preservers Show Economy of Treatment. *Ry. Age*, vol. 76, no. 3, Jan. 19, 1923, pp. 233-235, 1 fig. Results of tests and service records on use of creosote-petroleum oil mixture for treating ties; increases tie life, promises to cut cost. Abstract of Am. Wood-Preservers' Assn. report.

**RAILWAY TRACK**

**Double Tracking and Grade Reduction.** Frisco Makes Important Line Improvements. *Ry. Age*, vol. 76, no. 4, Jan. 26, 1924, pp. 275-279, 10 figs. Double tracking and grade reduction at several points by St. Louis-San Francisco effect marked saving with limited expenditures.

**Elevation.** Rogers Park Track Elevation. C. M. & St. P. Ry., T. H. Strate. *Ry. Rev.*, vol. 74, no. 3, Jan. 19, 1924, pp. 140-145, 13 figs. Describes work of elevating Chicago & Evanston division between Irving Park boulevard and Howard Street in Chicago, Ill., operated by Northwestern Elevated R. R. Co., eliminating grade crossing.

**Maintenance.** Maintenance Methods on the Lehigh Valley R. R., G. L. Moore. *Ry. Rev.*, vol. 74, no. 2, Jan. 12, 1924, pp. 101-103, 5 figs. Summary of results obtained by use of heavy rail and economy in labor.

**RAPID TRANSIT**

**Financing of Systems.** Detroit Rapid Transit Plant Financed by Direct Assessment. *Eng. & Contracting (Railways)*, vol. 61, no. 1, Jan. 16, 1924, pp. 131-134. New basis for providing funds for proposed system of subways or elevated lines.

**REFRIGERANTS**

**Sulphur Dioxide.** Thermal Properties of Sulphur Dioxide. D. L. Fiske. *Refriger. Eng.*, vol. 10, no. 6, Dec. 1923, pp. 197-200 and 204, 3 figs. Work undertaken to derive results to cover properties of superheated and saturated regions with a thermodynamically consistent set of equations.

**REFRIGERATING MACHINES**

**Autofrigor.** The "Autofrigor" Refrigerating Machine. *Engineering*, vol. 117, no. 3030, Jan. 25, 1924, p. 104, 4 figs. Small cold-storage apparatus suitable for private users, shopkeepers, etc.; is perfectly self-contained piece, electrically driven, and adaptable to practically any type of cold cupboard or chamber.

**Evaporating Systems.** Evaporating Systems for Refrigerants. W. F. Davis. *Ice & Refrigeration*, vol. 66, no. 1, Jan. 1924, pp. 7-10 and (discussion) 10-12. Past and present evaporators; details of design; foundation for evaporators; purifying refrigerant. Paper read at N. A. P. R. E. Convention. See also *Refriger. World*, vol. 59, no. 1, Jan. 1924, pp. 23-24.

**REFRIGERATING PLANTS**

**Ammonia Condensers.** Investigations of Ammonia Condensers. T. Shipley. *Ice & Refrigeration*, vol. 66, no. 1, Jan. 1924, pp. 17-22, 2 figs. Discusses condensers used on ammonia compression plants. Results of earlier investigations; advantages of low condenser pressures; development of design of Hestonville condenser and author's reasons for assuming such a design would give better results than other types; results of tests. Paper read before N. A. P. R. E.

**Electric Equipment Control.** Control of Electrical Equipment in Refrigerating Plants. H. P. Hill. *Ice & Refrigeration*, vol. 66, no. 1, Jan. 1924, pp. 22-26, 3 figs. Discusses transformers, starting of synchronous motors, keeping ice plant in continuous operation, etc. Paper read before N. A. P. R. E.

**Small.** Why the Small Refrigerating Plant Predominates in California. H. L. Lincoln. *Power*, vol. 59, no. 6, Feb. 5, 1924, pp. 217-218, 2 figs. Questions arising in considering proper prime movers to install; kind of cooling water used; design of condenser found desirable.

**REGULATORS**

**Pressure.** An Automatic Pressure Regulator. L. E. Dawson. *Indus. & Eng. Chem.*, vol. 16, no. 2, Feb. 1924, pp. 160-161, 1 fig. Apparatus satisfactorily maintains steady pressure for period of days with maximum variation of only 2 or 3 mm. of mercury when operating under 500 mm. vacuum.

**RESEARCH**

**Statistical Methods.** Application of. Some Applications of Statistical Methods to the Analysis of Physical and Engineering Data. W. A. Shewhart. *Bell System Tech. J.*, vol. 3, no. 1, Jan. 1924, pp. 43-87, 13 figs. Deals with application of elementary statistical methods for finding best frequency distribution of deviations; points out limitations of theory of errors, based on normal law; advantages to be gained by physicist or engineer from an application of methods reviewed.

**ROLLING MILLS**

**Alloy-Steel Rolling.** Rolling Alloy Steel. J. Clausen. *Blast Furnace & Steel Plant*, vol. 12, no. 2, Feb. 1924, pp. 113-116 and 133, 5 figs. Practice at plant of Harrisburg Pipe & Pipe Bending Co.

**Cold-Rolling Strip Mills.** Acme Steel Expands Cold Strip Capacity. G. L. Lacher. *Iron Age*, vol. 113, no. 5, Jan. 31, 1924, pp. 353-358, 7 figs. Features include recoiler, cooling gas for annealing, automatic roll grinder; material-handling facilities. See also *Iron Trade Rev.*, vol. 74, no. 5, Jan. 31, 1924, pp. 359-362, 8 figs.

**Tolerances in Rolling Sheets.** Tolerances in the Rolling of Steel Sheets. *Iron Age*, vol. 113, no. 7, Feb. 14, 1924, pp. 497-499. Causes of variations from gage and reasons for current practice presented from mill standpoint.

**RULING MACHINES**

**Grating.** Ruling 15,000 Lines per Inch. F. A. Stanley. *Am. Mach.*, vol. 60, no. 5, Jan. 31, 1924, pp. 161-166, 11 figs. Machine for ruling gratings and how it was built; lapping lead screw to correct errors; testing corrections with interferometer.

**S****SAND, MOLDING**

**Testing.** Points Need for Sand Test. Eugene W. Smith. *Foundry*, vol. 52, no. 3, Feb. 1, 1924, pp. 86-87. Suggests adoption of simple vibratory test for determining relation of silica and bond contents and influence upon casting losses. (Abstract.) Paper presented at Detroit Foundrymen's Assn.

**SCALES**

**Locomotive.** A Unique Locomotive Weighing Plant. C. C. Bailey. *Baldwin Locomotives*, vol. 2, no. 3, Jan. 1924, pp. 56-62, 7 figs. Comprises platform track scale of immense proportions, 24 individual wheel scales, concrete scale foundations of massive construction, and specially designed and well-equipped building which covers and protects scale and its mechanism.

**SCREW MACHINES**

**Automatic.** National-Acme Five-Spindle Automatic. *Machy. (N. Y.)*, vol. 30, no. 6, Feb. 1924, pp. 473-475, 4 figs. Provision of five spindles instead of four permits distribution of cutting strains over larger number of tools, and as result, there is less tendency for strain to occur at points where heavy cuts are being taken.

**SHAFTS**

**Whirling.** The Whirling of Shafts. J. Frith and F. Buckingham. *Instn. Elec. Engrs.—Jl.*, vol. 62, no. 325, Jan. 1924, pp. 107-113, 8 figs. Seeks to explain phenomenon of whirling by proving that it is essentially case of vibration and obeys laws of vibration, especially those relating to phase change between disturbing force and resulting displacement; describes experimental verifications of theories put forward.

**SHEET-METAL WORKING**

**British Factories.** Sheet Metal Working in British Factories. W. J. Hiscox. *Sheet Metal Worker*, vol. 14, no. 26, Jan. 18, 1924, pp. 995-996 and 1016. Conditions under which sheet metal department in manufacturing plants is operated; inadequate equipment prevalent.

**SMOKE ABATEMENT**

**Steam Plants.** Methods of Preventing Smoke in Small Steam Plants, and Cheap Furnaces That Will Do It. O. H. Wood. *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 84-87, 4 figs. Human element a factor, also design of furnace, and grates.

**SOLDERING**

**Gold and Silver.** The Soldering and Finishing of Precious Metals. *English Mechanics*, vol. 98, no. 3067, Jan. 4, 1924, pp. 342-343. Useful information on soldering of gold and silver, and on finishing processes.

**SOOT BLOWERS**

**Types.** Soot and Soot Blowers. *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 29-37, 30 figs. Why soot accumulates on boiler tubes; cost of soot accumulation, methods of removing it and application of various types of soot blowers to different kinds of boilers.

**SPARK PLUGS**

**Electrode Temperature.** The Effect of Electrode Temperature on the Sparking Voltage of Short Spark Gaps. F. B. Silsbee. *Nat. Advisory Committee for Aeronautics—Report*, no. 179, 1923, 10 pp., 4 figs. Investigation shows quite definitely that voltage required to produce spark across short spark gap is appreciably reduced by raising temperature of one electrode.

**SPRINGS**

**Ring.** Characteristics of the Ring Spring. O. R. Wikander. *Am. Mach.*, vol. 60, no. 7, Feb. 14, 1924,

pp. 253-254, 2 figs. Recently developed spring; material stressed in pure tension and compression under load; calculations for theoretical pressure; test results in railway work.

**Material Testing.** What Are the Best Mechanical Tests for Spring Materials? W. Rosenhain. *Automotive Industries*, vol. 50, no. 6, Feb. 7, 1924, pp. 278-280. Difficult to determine quantitative relation between various qualities such as strength, hardness, resistance to shock, etc.; actual value of test results should be considered; author claims adequate specifications are still lacking.

**STEAM**

**Calorimetric Examination.** A Calorimetric Method of Surveying the Behavior of Steam. N. S. Osborne. *Mech. Eng.*, vol. 46, no. 2, Feb. 1924, pp. 88-90, 2 figs. Describes elements of method forming basis of experimental program on properties of steam upon which Bur. of Standards is engaged.

**Production, Effect of Sulphur on.** The Effect of Sulphur on Steam Production. T. A. Marsh. *Combustion*, vol. 10, no. 2, Feb. 1924, pp. 123-124. The serious increase in cost of steam due to necessity for combating effect of this element in coal.

**Research.** Progress in Steam Research. *Mech. Eng.*, vol. 46, no. 2, Feb. 1924, pp. 81-87 and 108, 13 figs. Contains following reports in abstract: Report on Progress in Steam Research at the Bureau of Standards, N. S. Osborne and H. F. Stimson; Progress of the M.I.T. Portion of the Steam Investigation, F. G. Keyes; Progress Report on Work at Harvard University on the Joule-Thomson Effect, R. V. Kleinschmidt; Progress Report on the Joule-Thomson Effect, H. M. Davis.

**Superheating.** Superheated Steam and Superheaters. *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 93-100, 16 figs. Advantages of superheated steam, its characteristics, uses, application and particulars regarding several designs in common use.

**STEAM-ELECTRIC PLANTS**

**Coal-Mine.** A Modern Colliery Power Plant. E. L. Hann. *S. Wales Inst. Engrs.—Proc.*, vol. 39, no. 5, Jan. 12, 1924, pp. 583-631, 29 figs. partly on supp. plates. Description of power scheme, of Powell Duffryn Steam Coal Co., Ltd., which has been installed in Rhymney Valley for purpose of providing a cheap power supply in such quantity as to enable machine mining to be developed to its fullest extent, and electrical drives to be employed in all cases in which it appears to be economically correct to do so.

**STEAM METERS**

**Types.** Measurement of Steam. *Times Trade & Eng. Supp.*, vol. 13, no. 288, Jan. 12, 1924, p. 439. Types of steam meters; principles of operation; some actual devices.

**STEAM POWER PLANTS**

**Condenser Operation in.** Profit Possibilities of Vacuum in the Power Plant. Jas. T. Beard, 2nd. *Indus. Mgt. (N. Y.)*, vol. 67, no. 2, Feb. 1924, pp. 115-119, 5 figs. Discusses possibilities of condenser operation and how to realize them.

**Fuel for Coal-Fired.** Fuel for Small Coal Fired Steam Generating Plants. F. J. Paque. *Combustion*, vol. 10, no. 2, Feb. 1924, pp. 120-122, 2 figs. Discusses requirements to be met by a given fuel in relation to the various types of fuel available to average small plant.

**Laundry.** A Modern Laundry Power Plant. *Power*, vol. 59, no. 5, Jan. 29, 1924, pp. 162-164, 3 figs. Describes new plant of Great West Laundry Co., Chicago, in which problem was to balance power-steam with exhaust-steam requirements for heating laundry water; in boiler room fuel spreaders and unusual methods of controlling automatically feed of coal and water are features.

**Motor-Driven Auxiliaries.** Power Plant Auxiliaries and Their Relation to Heat Balance. A. L. Penniman, Jr. *Am. Inst. Elec. Engrs.—Jl.*, vol. 43, no. 2, Feb. 1924, pp. 118-121, 1 fig. Points out economy of stage bleeding together with electric drive, and describes use of auxiliary generator connected to and driven by main turbine.

**Sand Mills and Pits.** Ottawa Silica Co. Operates New Plant. *Power Plant Eng.*, vol. 28, no. 4, Feb. 17, 1924, pp. 215-218, 7 figs. Expected economy realized by construction of new central steam-generating plant in place of two old boiler houses, which supplies steam for two sand-preparing mills and two sand pits.

**STEAM TRAPS**

**Applications.** Principles and Applications of Modern Steam Traps. W. E. Biggs and W. R. Woolrich. *Nat. Engr.*, vol. 28, no. 2, Feb. 1924, pp. 56-58, 2 figs. Factors to be considered in selection of a steam trap for a given purpose; classification and applications of different types with suggestions for their installation and operation.

**Types.** Steam Traps of Various Makes and Their Operation. *Southern Engr.*, vol. 40, no. 5, Jan. 1924, pp. 51-63, 29 figs. Describes designs, and discusses manner in which they perform their work.

**STEAM TURBINES**

**Back-Pressure.** Performance Tests on a Back-Pressure Turbine in a German Sugar Refinery (Leistungsversuche an einer Gegendruckturbine der ersten Brünnner Maschinenfabriks-Gesellschaft in der Nestomitzer Zuckerraffinerie in Nestomitz a. E.). E. Josse and A. Stodola. *Zeit. des Vereines deutscher Ingenieure*, vol. 67, no. 52, Dec. 29, 1923, pp. 1163-1168, 1 fig. Describes notable improvement in design of high-pressure turbines; results of tests on turbine built by Brünnner Maschinenfabriks Gesellschaft show efficiency of 85 per cent.

**Foundations.** Checking Foundations for Large

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**Turbines.** Power, vol. 59, no. 4, Jan. 22, 1924, pp. 135-137, 2 figs. Discusses requirements for foundations for Westinghouse turbines, as well as inspections before installing unit, such as ordinarily devolve upon service engineer in charge of erecting work.

**Isolated Plants.** Applications of Steam Turbines for Isolated Plants, C. L. Hubbard. Nat. Engr., vol. 28, no. 1, Jan. 1924, pp. 14-17, 7 figs. Description of the different types of steam turbines and their operating principles; comparative advantages of turbines and reciprocating engines; comparative performance of engines and turbines; factors to be considered in selection of a prime mover.

**Steam-Air Drive for Motorships.** Steam-Air Turbines for Auxiliary-Engine Drive, Especially on Motorships (Dampf-Luft-Turbinen für Hilfsmaschinenantrieb, insbesondere auf Motorschiffen), H. Melan. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 2, Jan. 12, 1924, p. 28, 1 fig. Deals with drive of auxiliary engines on motor tank ships; steam, air and steam-air drive; tests at Kiel shipyard of the Deutsche Werke on reciprocating engines and turbines; graphic reproduction of results with steam-air turbines; conclusions.

**Types and Selection.** The Control of Power Production, Chas. L. Hubbard. Factory, vol. 32, no. 2, Feb. 1924, pp. 166-169, 204, 206 and 208, 18 figs. Types of steam turbines and their selection.

## STEEL

**Micrographic Study.** Micrographic Study of Plain Carbon Steel, R. Rimbach. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 46-50, 33 figs. Presents very complete set of microphotographs showing effect of various heat treatments on 1.12 carbon steel.

**Nickel.** See NICKEL STEEL.

**Tool.** See TOOL STEEL.

## STEEL CASTINGS

**Heat Treatment.** Making Steel Castings as Tough as Forgings, L. R. Mann. Can. Foundryman, vol. 15, no. 1, Jan. 1924, pp. 16-17, 2 figs. Proper heat treatment insures properties being imparted to metal which are comparable to those found in best forged steel. Extracts from paper read before Wis. Foundrymen's Assn.

**Manufacture.** Speeding Up the Production of Large and Superior Steel Castings, S. G. Roberts. Compressed Air Mag., vol. 29, no. 1, Jan. 1924, pp. 731-736, 16 figs. Use of compressed air and pneumatic tools in plant of Wheeling Mold & Foundry Co., Wheeling, W. Va.; time and money saved, and large castings of a complicated character can be turned out rapidly with assurance of success.

## STEEL, HEAT TREATMENT OF

**Brazed and Welded Steel.** Some Effects of Brazing and Welding, H. C. Knerr. Forging—Stamping—Heat Treating, vol. 10, no. 1, Jan. 1924, pp. 33-37, 20 figs. Application of heat as in brazing and welding removes strength produced by cold working; effect of heat treatment on brazed and welded steel.

**Liquid Heating.** Advantages of Uniformity in Heat Treatment, A. E. Bellis. Can. Machy., vol. 31, no. 4, Jan. 24, 1924, pp. 17-18, 4 figs. Notes on method of heat treating using a liquid heating medium; its advantages; possibilities of overcoming temperature troubles by using this method becoming more widely recognized.

**Mild Steel.** The Heat Treatment of Mild Steel, R. T. Rolfe. Metal Industry (Lond.), vol. 24, nos. 1, 2 and 3, Jan. 4, 11 and 18, 1923, pp. 9-10, 33-34, and 57-59, 10 figs. Structure of mild steel; need for heat treatment of mild steel; heat treating castings; mechanism of heat treatment; burnt steel; typical range of properties obtainable; heat treating forgings; work hardening; breaking-down of pearlite; etc.

**Piston Pins and Shackle Bolts.** Individual Heat Treatment Will Improve Quality of Product, C. N. Dawes. Automotive Industries, vol. 50, no. 4, Jan. 24, 1924, p. 177, 2 figs. Special furnaces developed for handling of piston pins and shackle bolts make it possible to treat each part separately; specific requirements should determine furnace type used.

## STEEL INDUSTRY

**South Africa.** Steel Development in South Africa. Engineer, vol. 137, no. 3554, Feb. 8, 1924, pp. 144-145. Iron-ore deposits; Newcastle blast furnace; work being undertaken and new program.

## STEEL MANUFACTURE

**Basic.** Examination of Metallurgical Processes in the Basic Process According to the Flame Gases (Beurteilung der metallurgischen Prozesse beim Thomasverfahren nach den Flammengasen), G. Bulle. Stahl u. Eisen, vol. 44, no. 1, Jan. 3, 1924, pp. 9-11 and (discussion) 11-14, 8 figs. Flame gases in open-hearth and basic processes; practical examples with Thomas converter; conclusions; measuring device.

## STEEL WORKS

**Electrical Developments.** Achievements in the Steel Industry During the Year 1923, G. E. Stoltz. Iron & Steel Engr., vol. 1, no. 1, Jan. 1924, pp. 55-58, 4 figs. Large number of electric motors being installed to replace steam engines. Describes electrical installations made.

**Italy.** The Lombardy Iron and Steel Works. Iron & Coal Trades Rev., vol. 108, no. 2915, Jan. 11, 1924, pp. 50-51, 19 figs. partly on pp. 61-64. Describes Sesto San Giovanni, Milan, Vobarno, and Dongio works of Società Anonima Acciaierie e Ferrerie Lombarde. See also description of Sesto San Giovanni Works in Foundry Trade J., vol. 29, no. 388, Jan. 24, 1924, pp. 71-74, 5 figs.

## STOKERS

**Automatic.** Mechanical Automatic Stokers. Southern Engr., vol. 40, no. 5, Jan. 1924, pp. 74-83,

23 figs. Necessity of mechanical stoker from standpoint of capacity and economy; several types of stokers.

## SUBWAYS

**Train-Movement Noise, Reduction of.** Reducing Noise in Train Operation. Elec. Ry. J., vol. 63, no. 4, Jan. 26, 1924, pp. 135-138. Results of extended series of tests made by Underground Elec. Rys. of Lond. Methods developed for preventing noise from entering cars; sound-absorbing material placed in roof, walls and floor; heavy closed windows, special ventilators and shrouding of trucks are principal features incorporated in new cars.

# T

## TELESCOPES

**Development.** The Growth of the Telescope, Wm. J. S. Lockyer. Sci. Monthly, vol. 18, no. 1, Jan. 1924, pp. 92-104, 4 figs. History of development of astronomical telescope.

## TERMINALS, RAILWAY

**Freight.** Clifton Forge (Va.) Terminal Involves Heavy Work. Ry. Age, vol. 76, no. 6, Feb. 9, 1924, pp. 365-367, 4 figs. Progress made in construction of new facilities by Chesapeake & Ohio; involve construction of enlarged and modern freight terminal, including total of 66 mi. of tracks over area of 636 acres. See also Ry. Rev., vol. 74, no. 6, Feb. 9, 1924, pp. 241-248, 16 figs.

## THERMODYNAMICS

**Third Law.** A Statement of the Third Law of Thermodynamics, E. D. Eastman. Am. Chem. Soc.—Jl., vol. 46, no. 1, Jan. 1924, pp. 39-43. Argument is made that there is in ideal case no sharp dividing line between crystalline and (supercooled) liquid states; statement of third law is proposed which is in harmony with ideas expressed.

**Water-Vapor Diagram.** Straight-Line Water-Vapor Diagram for the Standard and High-Pressure Ranges (Geradliniges Wasserdampf-Diagramm für Normal- und Hochdruckgebiet), M. Seiliger. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 2, Jan. 12, 1924, pp. 25-27, 2 figs. Based on the Callendar-Mollier formulas for water vapor, author develops a new diagram, and claims to show that nearly all changes of state of water vapor can be expressed by straight lines.

## TIRES, RUBBER

**Bicycle.** Manufacture of Cycle Tires, India Rubber World, vol. 69, no. 4, Jan. 1, 1924, pp. 227-228, 4 figs. Healey-Shaw process; describes fabric slitting, wire covering, spool wrapping, foundation building, vulcanizing.

**Curing, Temperature Measurement.** The Measurement of Temperature in Pneumatic and Solid Tyres During Cure, A. A. Perks and R. W. Griffiths. India-Rubber J., vol. 67, no. 1, Jan. 5, 1924, pp. 13-16 and 19-21, 11 figs. Use of a calibrated thermo-junction, inserted in required position, for obtaining record of temperature during cure at any part of a tire; details of methods which have proved successful, and some results obtained.

**Low-Pressure.** Building Balloon Tires, India Rubber World, vol. 69, no. 4, Jan. 1, 1924, pp. 217-218, 5 figs. Reason for balloon tires; production operations similar to high-pressure tires; Thropp system; band building; applying fabric bands.

## TOOL STEEL

**Hardness Tests.** Comparative Tests of Hardness of Various Steel Tools at High Temperatures (Essais comparatifs de dureté à chaud sur divers aciers à outils), J. Cohade. Revue Universelle des Mines, vol. 1, no. 2, Jan. 15, 1924, pp. 75-104, 16 figs. Brief review of previous work on subject and discussion of author's own tests, carried out at works of Schmidt & Co. at Creusot, France; describes heat treatment to which steels were subjected previous to tests and method of testing, and gives results obtained.

## TOOLS

**Cross-Slide Facing.** Cross Slide Facing Tools for Automatics, F. O. Hickling. Machy. (Lond.), vol. 23, no. 589, Jan. 10, 1924, pp. 483-484, 3 figs. Discusses troubles that are encountered and gives examples of how difficulties have been overcome.

**Economical Production.** Economical Production of Workpieces (Wirtschaftliche Fertigung von Werkstücken), J. Marretsch. Werkstattstechnik, vol. 18, no. 1, Jan. 1, 1924, pp. 4-7, 46 figs. Use of economical devices in quantity and series production; economical production of turning, boring and milling tools in factory.

## TRAILERS

**Motor-Transport.** Details of the H. I. C. Motor Transport Trailer. Engineering, vol. 117, no. 3032, Feb. 8, 1924, p. 186, 13 figs. partly on p. 178. Has advantage of shock reduction through exceptional springing.

## TRANSPORTATION

**Barge Line.** Federal Barge Line Proving Costly Experiment. Ry. Age, vol. 76, no. 6, Feb. 9, 1924, pp. 381-383, 3 figs. Mississippi-Warrior service an unprofitable venture, although handling capacity traffic.

**Coordination of National Systems.** Declarations of the Transportation Conference. Ry. Age, vol. 76, no. 3, Jan. 19, 1923, pp. 237-243. Findings and conclusions of Nat. Transportation Conference called by

U. S. Chamber of Commerce, in regard to governmental relations to railroad transportation, railroad consolidations, readjustment of relative freight-rate schedules, relation of highways and motor transport to other transportation agencies, development of waterways and coordination of rail and waterway service, and taxation of transportation agencies. See also Ry. Rev., vol. 74, no. 3, Jan. 19, 1924, pp. 154-156.

## TUBES

**Bending Stresses.** Bending Stresses in Thin-Walled Tubes, J. Case. Lond., Edinburgh, & Dublin Philosophical Mag. & Jl. Sci., vol. 47, no. 277, Jan. 1924, pp. 197-208, 6 figs. Investigation of stresses in thin tubular beam, such as steel factory chimneys, monocoque fuselages of airplanes, hulls of submarine vessels, and the like.

**Charcoal-Iron, Manufacture.** Producing Charcoal Iron Tubes, G. H. Woodroffe. Iron Trade Rev., vol. 74, no. 7, Feb. 14, 1924, pp. 482-487, 10 figs. Methods employed by Parkesburg Iron Co., Parkesburg, Pa., in manufacture of charcoal iron tubes.

**Steel, Seamless.** Manufacture of Seamless Steel Tubes and Cylinders, A. R. Chaytor. Mech. World, vol. 75, no. 1932, Jan. 11, 1924, pp. 27-29. Historical review; difficulties encountered in early processes; material for manufacture; process and plant employed in manufacture; cold drawing. Paper read before Jr. Instn. Engrs.

## TURBO-ALTERNATORS

**Tests.** Turbo-Alternator Tests, John Bruce. Elec. Rev., vol. 94, no. 2406, Jan. 4, 1924, pp. 4-6, 7 figs. Résumé of methods of making principal measurements and apparatus used in official and routine testing of turbo-alternator units, in case of large electricity supply undertaking.

## TURBO-GENERATORS

**30,000-Kw.** 30,000 K. W. Steam Turbo-Generator at Rotherdam. Engineering, vol. 117, nos. 3029 and 3031, Jan. 18 and Feb. 1, 1924, pp. 65-67 and 134-136, 49 figs. partly on supp. plates. Machine is largest yet constructed in England, and one of largest in world to develop its power in single casing; built by Brit. Thomson-Houston Co. and is of their multi-stage impulse type.

# V

## VENTURI METERS

**Pulsating Flow.** Venturi Meter for Pulsating Flow. Engineering, vol. 137, no. 3027, Jan. 4, 1924, pp. 7-9, 14 figs. Describes new type of instrument known as 1922 Venturi Recorder, which appears to have overcome serious objection to Venturi meter when working with pulsating flow.

## VIBRATIONS

**Machinery.** Vibration and Structural Damage, E. Latham. Engineering, vol. 117, no. 3032, Feb. 8, 1924, pp. 163-164, 4 figs. Describes physical results which may arise as result of vibration transmitted by operation of machinery in industrial plant.

# W

## WAGES

**Family-Wage System.** "Family-Wage" System in Germany and Certain Other European Countries, Mary T. Waggaman. Monthly Labor Rev., vol. 18, no. 1, Jan. 1924, pp. 20-29. Methods of payment; labor's attitude on family wages.

## WEIGHING MACHINES

**Automatic.** Weighing in Bulk, S. H. Johnson. Indus. Management (Lond.), vol. 10, no. 13, Dec. 2, 1923, and vol. 11, nos. 1 and 2, Jan. 10 and 24, 1924, pp. 366-370, 22-26 and 54-55, 9 figs. Historical review of automatic weighing machines; principles of automatic weighing machine and description of different types; methods of compensation; dust protection; etc.

## WEIGHTS AND MEASURES

**Inch and Millimeter, Relation between.** The Relation between Inches and Millimeters—Discussion, C. C. Stutz. Am. Mach., vol. 60, no. 4, Jan. 24, 1924, pp. 145-146. Discusses article by H. W. Bearce published in previous issue of same journal.

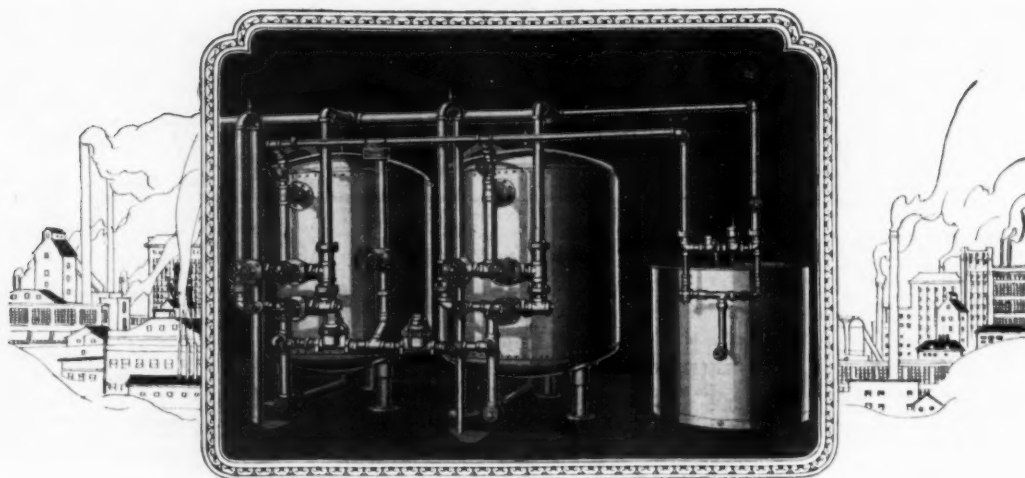

## WELDING

**Electric.** See ELECTRIC WELDING; ELECTRIC WELDING, ARC.

**Oxy-Acetylene.** See OXY-ACETYLENE WELDING.

## WIND MOTORS

**Control Methods.** A New Control Method for Wind Motors (Ein neues Regelverfahren für Windkraftwerke), R. Bosselmann. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 3, Jan. 19, 1924, pp. 48-52, 10 figs. Describes two methods of control; one indicating most favorable vane speed for prevailing velocity of wind and making possible the use of dynamos for uniform number of revolutions; the other automatically regulates voltage of system, and does away with battery switch operation and all switch-board attendance.

## The Needless Toll That Hard Water Takes in Your Boiler Room

Hard water deposits scale in boiler tubes and water pipes. It causes waste of coal. It causes overheating and consequent premature weakening of boiler tubes. Causes granulation, burning and fracture of boiler material.

It necessitates the use of costly boiler compounds. It increases the costs of boiler and heater cleaning.

### Wayne Water Softeners Eliminate Hard Water Expenses

Wayne softened water absolutely prevents the formation of boiler scale or hard water deposits. It cuts out the waste of coal. It saves upkeep expenses. Saves labor and repair expenses. Eliminates the need for boiler compounds.

Many Wayne water softeners paid for themselves in three months. They make it cheaper to use soft water in boiler rooms than to do without it.

Made in various sizes—costing from \$600 up, depending on capacity.

### Free Service to You

Write for gallon water containers so we may make an analysis of the water you use now. This gives a definite basis of how much the Wayne Water Softener will save you. The container and analysis are Free. Write for book on "Water Softening and Filtration."

### Wayne Water Softeners for the Home

Wayne rapid-rate Water Softeners are available for homes of all sizes. Easy to connect with present water piping. Ask for booklet.

For the information of the purchasers of Wayne Water Softeners or those of any other make, particularly such purchasers as those who have been threatened with suits to recover royalties, Judge Arthur J. Tuttle in the United States District Court at Detroit on November 8, 1923, found the Gans patent No. 1,195,923 to be void. This is the patent which one of our competitors claimed to be infringed by all zeolite water softener manufacturers.

### Wayne Tank & Pump Company, 714 Canal Street, Ft. Wayne, Indiana

*Division Offices in:* Atlanta, Boston, Chicago, Cincinnati, Cleveland, Columbus, Dallas, Dayton, Des Moines, Detroit, Indianapolis, Jacksonville, Kansas City, Los Angeles, Milwaukee, Memphis, Minneapolis, New York, Omaha, Philadelphia, Pittsburgh, San Francisco and St. Louis.

*Foreign Offices:* Toronto, London and Paris

*Warehouses in:* Philadelphia and San Francisco

*An International Organization with Sales and Service Offices Everywhere*

REG. U.S. TRADE MARK  
**Wayne**  
RAPID RATE

**Water Softeners for Household and Industrial Purposes**

# THE ENGINEERING INDEX

(Registered United States, Great Britain and Canada)

**THE ENGINEERING INDEX** presents each month, in conveniently classified form, items descriptive of the articles appearing in the current issues of the world's engineering and scientific press of particular interest to mechanical engineers. At the end of the year the monthly installments are combined along with items dealing with civil, electrical, mining and other branches of engineering, and published in book form, this annual volume having regularly appeared since 1906. In the preparation of the Index by the engineering staff of The American Society of Mechanical Engineers some 1200 technical publications received by the Engineering Societies Library (New York) are regularly reviewed, thus bringing the great resources of that library to the entire engineering profession.

Photoprint copies (white printing on a black background) of any of the articles listed in the Index may be obtained at a price of 25 cents a page. When ordering photoprints identify the article by quoting from the Index item: (1) Title of article; (2) Name of periodical in which it appeared; (3) Volume, number, and date of publication of periodical; (4) Page numbers. A remittance of 25 cents a page should accompany the order. Orders should be sent to the Engineering Societies Library, 29 West 39th Street, New York.

(See also page 308 of this issue for supplementary items.)

## ABRASIVE WHEELS

**Preparation for Polishing.** Preparing Wheels for Polishing, F. D. Bowman. Iron Trade Rev., vol. 74, no. 12, Mar. 20, 1924, pp. 796-797, 3 figs. Various grades should be used depending upon finish desired on work; properties and preparation of glue, application of abrasive, setting, temperature and storage are factors in wheel effectiveness.

**Selection and Uses.** Grinding for Quick Repetition, W. Wilson. Commonwealth Engr., vol. 11, nos. 4 and 5, Nov. 1 and Dec. 1, 1923, pp. 148-150 and 183-185, 4 figs. Discusses grinding wheels, including rating, selection for work, lubrication, speeds, mounting, and uses; drill grinding.

## ABRASIVES

**Papers and Cloths.** Finishing with Abrasive Paper, John M. Cook. Iron Trade Rev., vol. 74, no. 9, Feb. 28, 1924, pp. 613-615, 13 figs. Methods employed in making abrasive paper and cloth.

## ACCOUNTING

**Installation of Systems.** Some Problems in the Installation of Accounting Systems, Wm. A. Ullrich. J. Accountancy, vol. 37, no. 3, Mar. 1924, pp. 193-201. Discusses problems showing how ingenuity of accountant is taxed to find new ways to solve difficulties which present themselves.

**Public-Utility.** Unit Plan of Accounting for Public Utilities, H. J. Johnson. Am. Gas Assn. Monthly, vol. 6, no. 3, Mar. 1924, pp. 147-153, 9 figs. Describes system which is a modification of plan known as "bookkeeping without books;" is exceedingly rapid in its operation as well as 100 per cent complete and is designed to meet most exacting requirements.

## AIR COMPRESSORS

**Angle Compound.** An Angle Compound Air Compressor, Engineer, vol. 137, no. 3557, Feb. 29, 1924, pp. 224-225, 5 figs. New type of air compressor, manufactured by Sullivan Machy. Co., London, cylinders of which are set at right angles in horizontal and vertical positions, round single crank; engine is of uniflow class, but has valves to control exhaust.

**Electric Motors for.** The Application of A. C. Polyphase Motors to the Drive of Piston Air Compressors (Remarques sur l'application des moteurs électriques à courants alternatifs polyphasés à la commande de compresseurs d'air à pistons), A. Barjou. Revue Générale de l'Electricité, vol. 15, no. 5, Feb. 2, 1924, pp. 167-173, 6 figs. Based on study of function of compressors of constant speed, author concludes that only self-starting synchronous and asynchronous induction motors are suitable for drive of such compressors, and in most cases, former is preferable.

**Pulsations Due to Synchronous-Motor Drives.** Pulsations Due to Synchronous Motor Drives, Q. Graham. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 342-344, 4 figs. Use of synchronous motors for driving compressors may cause severe pulsations in power on line supplying motors; cause and effects of pulsations.

## AIR PUMPS

**Water- vs. Steam-Jet.** Water- vs. Steam-Jet Air Pumps (Wasserstrahl- oder Dampfstrahlpumpen?), S. v. Le Juge. Wärme, vol. 47, no. 3, Jan. 18, 1924, pp. 21-23, 2 figs. It is shown by comparison that the steam-jet pump, because of inadequate sub-cooling of mixture, delivers a much poorer vacuum with same steam consumption than a water-jet air pump, as constructed by H. P. Müller.

## AIRPLANE ENGINES

**Compression Pressure, Increasing.** Increasing the Compression Pressure in an Engine by Using a Long Intake Pipe, R. Matthews and A. W. Gardiner. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 150, Feb. 1924, 9 pp., 5 figs. Investigation covering engine speeds between 500 and 1800 r.p.m.; data obtained are included in form of curves.

**Design.** Airplane-Engine Designing for Reliability, Geo. J. Mead. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 277-285, 13 figs. Recent performances; lessons learned from duration testing; design of connecting rod; defects developed by duration running; Wright T-3 engine; application of experience to future design; development, production and operation of design.

**French Types.** Some French Light Plane Engines, Flight, vol. 16, no. 8, Feb. 21, 1924, pp. 104-106, 7 figs. Principal characteristics and features of Anzani 2-cylinder, Clerget-Renault 2-A 2-cylinder, Gnome-Rhone 2-cylinder, Salomon A.D.-3 3-cylinder, Sergeant 4-cylinder, and Valsin 4-cylinder engines.

**1000-Hp.** Progress Toward 1000 Hp. Aircraft Engines, G. D. Angle. Aviation, vol. 16, no. 8, Feb. 25, 1924, pp. 198-200, 2 figs. Advantages of single engine; Rolls-Royce Condor; Fiat A14 engine; big engines in France; 1000-hp. Lorraine-Dietrich; Napier cub; American developments; Air Service WIA engine.

**Specifications.** Aircraft Engine Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, p. 463. American and British specifications.

**Water-Cooled.** Water-Cooled Aero Engines, A. J. Rowledge. Automobile Engr., vol. 14, no. 186, Feb. 1924, pp. 50-54, 12 figs. Consideration of design; cooling system; cylinder construction; crankshafts; lubrication; engine suspension; gearing.

## AIRPLANES

**Commercial.** The "Feiro I" Commercial Monoplane, Flight, vol. 16, no. 7, Feb. 14, 1924, pp. 86-87, 3 figs. First Hungarian machine; strut-braced monoplane with wing resting on top of fuselage; 120-hp. Le Rhone rotary engine; span 46 ft. 9 in., length 28 ft. 11 in., chord 6 ft. 7 in., wing area 280 sq. ft.

**Construction.** Building Government Airplanes, F. G. Steinbach. Iron Trade Rev., vol. 74, no. 10, Mar. 6, 1924, pp. 665-670 and 673, 11 figs. Difficulties encountered; fabrication of aluminum alloys important phase of construction; seasoned organization essential. Methods employed at plant of Glenn L. Martin Co., Cleveland.

**Glinters.** The Magman Monoplane Glider. Aviation, vol. 16, no. 10, Mar. 10, 1924, pp. 257-258, 1 fig. French machine designed for gust-soaring; design based on bird flight.

**Induced Drag.** Induced Drag of Multiplanes, L. Prandtl. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 182, Mar. 1924, 22 pp., 8 figs. Calculation is based upon assumption that lift on wings is distributed along wing in proportion to ordinates of semi-ellipse; formulas and numerical tables are given for calculating drag; most favorable arrangements of biplanes and triplanes are discussed and results are further elucidated by means of numerical examples. Translated from Technische Berichte, vol. 3, no. 7.

**Klemperer-Aachen.** An Interesting German Light Monoplane, A. Martens. Flight, vol. 16, no. 8, Feb. 21, 1924, p. 108, 1 fig. Principal details of Klemperer-Aachen, having 2-cylinder air-cooled Siemens engine with rated power of 5-11 hp.; length overall 14 ft. 9 in.,

span 42 ft. 8 in., height 5 ft. 11 in., wing area 161.5 sq. ft., speed 43.6 m.p.h.

**Manless.** Automatically Piloted Airplane and Guidance by Radiotelegraphy (L'avion automatique et la direction des avions par T.S.F.), P. Hémarquinier. Nature (Paris), no. 2598, Jan. 19, 1924, pp. 39-43, 9 figs. Study of practical devices employed by M. Percheron and his co-workers which brought about good results obtained in tests at Etampes.

**Models.** Pressure Distribution on. Investigation of the Distribution of Pressure on the Body of an Airplane Model (Onderzoek van de drukverdeling op den romp van een vliegtuigmodel), Ingenieur, vol. 39, no. 4, Jan. 26, 1924, pp. 58-63, 9 figs. Pressure is measured at various points of model by means of sensitive micrometer; results plotted in diagrams.

**Seaplanes.** See SEAPLANES.

**Specifications.** Airplane Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 458-462. Specifications for American and foreign airplanes.

**Swallow.** The 1924 Swallow Commercial Three-Seater. Aviation, vol. 16, no. 7, Feb. 18, 1924, p. 179, 1 fig. Machine is equipped with Curtis OX5 engine and has desirable commercial features such as small dimensions, ease of control, low initial cost and very low maintenance cost.

**Swanson-Freeman.** The Swanson-Freeman "SS 4" Two-Seater Biplane. Flight, vol. 16, no. 9, Feb. 28, 1924, p. 116, 1 fig. Principal data and dimensions: length 21 ft. 7 in., height 8 ft. 6 in., span 28 ft., chord 4 ft. 4 in.; 80-hp. Le Rhone engine.

**Training.** Success of Boeing Naval Training Plane. Aviation, vol. 16, no. 10, Mar. 10, 1924, p. 261, 1 fig. New Wright-engined plane of 200 hp. which won Navy's training-plane competition at Pensacola naval air station.

**Vortices and Airfoil Lift.** Note on Vortices and on Their Relation to the Lift of Airfoils, M. M. Munk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 184, Mar. 1924, 15 pp., 2 figs. Discusses meaning of vortices, so often mentioned in connection with creation of lift by wings; action of wings can be more easily understood without use of vortices.

**Wings.** Interference of Multiplane Wings Having Elliptical Lift Distribution, H. von Sanden. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 181, Feb. 1924, 3 pp. Examination as to whether calculation of mutual induction or interference of two-wing surfaces are substantially altered by assuming elliptical instead of uniform lift distribution. Translated from Technische Berichte, vol. 3, no. 7.

## AIRSHIPS

**Shenandoah.** Rigid Airships—United States Ship "Shenandoah," H. T. Bartlett. U. S. Naval Inst. Proc., vol. 50, no. 2, Feb. 1924, pp. 161-172, 3 figs. Description of the Shenandoah; length 680 ft., diameter 78.7 ft., height 96 ft., gas capacity 2,150,000 cu. ft., deadweight about 74,000 lb., speed about 60 m.p.h.

## ALLOYS

**Aluminum.** See ALUMINUM ALLOYS.

**Cadmium-Lead-Zinc.** The Cadmium-Lead-Zinc System, M. Cook. Inst. Metals—advance paper, no. 3, for meeting Mar. 12-13, 1924, 17 pp., 10 figs. Numbering of alloys; preparation of alloys and thermal method; liquidus surface; solidus; binary eutectics; region of partial miscibility; microscopic examination.

**Copper.** See COPPER ALLOYS.

# Classified List of Mechanical Equipment

## Manufactured by Firms Represented in MECHANICAL ENGINEERING

FOR ALPHABETICAL LIST OF ADVERTISERS, SEE PAGE 174

**Accumulators, Hydraulic**  
 \* Farrel Foundry & Machine Co.  
 \* Mackintosh-Hemphill Co.  
 \* Worthington Pump & Machinery Corp.

**Aftercoolers, Air**  
 \* Ingersoll-Rand Co.

**Agitators**  
 Hill Clutch Machine & Fdry. Co.

**Air Compressors, Receivers, etc.**  
 (See Compressors, Receivers, etc., Air)

**Air Conditioning Apparatus**  
 \* American Blower Co.  
 \* Carrier Engineering Corp'n  
 \* Clamage Fan Co.  
 \* Sturtevant, B. F. Co.

**Air-Jet Lifts**  
 \* Schutte & Koerting Co.

**Air Washers**  
 \* American Blower Co.  
 \* Carrier Engineering Corp'n  
 \* Clamage Fan Co.  
 \* Cooling Tower Co. (Inc.)  
 \* Spray Engineering Co.  
 \* Sturtevant, B. F. Co.

**Alloys**  
 Driver-Harris Co.

**Alloys (Calite)**  
 Calorizing Co.

**Ammeters**  
 \* Bristol Co.  
 \* General Electric Co.  
 \* Westinghouse Electric & Mfg. Co.

**Anemometers**  
 \* Taylor Instrument Cos.  
 Weber, F. Co. (Inc.)

**Annealing**  
 \* American Metal Treatment Co.

**Arbors**  
 \* Cleveland Twist Drill Co.

**Arc Welding Equipment**  
 \* Westinghouse Elect. & Mfg. Co.

**Arches, Boiler Furnace**  
 \* McLeod & Henry Co.  
 \* Titusville Iron Works Co.

**Arches, Fire Door**  
 \* McLeod & Henry Co.

**Arches, Ignition (Flat Suspended)**  
 \* Combustion Engineering Corp'n  
 \* McLeod & Henry Co.

**Asbestos Products**  
 Carey, Philip Co.  
 Garlock Packing Co.  
 Johns-Manville (Inc.)

**Ash Handling Equipment**  
 Baker Dunbar Co.

**Autoclaves**  
 Farrel Foundry & Machine Co.

**Babbitt Metal**  
 \* Medart Co.  
 \* Westinghouse Elect. & Mfg. Co.

**Ball Bearings, Gages, etc.**  
 (See Bearings, Gages, Ball)

**Balls, Brass and Bronze**  
 \* Atlas Ball Co.  
 \* Gwilliam Co.

**Balls, Steel**  
 \* Atlas Ball Co.  
 \* Gwilliam Co.  
 \* New Departure Mfg. Co.  
 \* S K F Industries (Inc.)

**Barometers**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Taylor Instrument Cos.

**Barometers, Mercurial**  
 \* Tagliabue, C. J. Mfg. Co.

**Bearings, Ball**  
 \* Fafnir Bearing Co.  
 \* Gwilliam Co.  
 \* Marlin-Rockwell Corp'n  
 \* New Departure Mfg. Co.  
 \* Norma Co. of America  
 \* S K F Industries (Inc.)  
 \* Strom Ball Bearing Mfg. Co.

**Bearings, Radial Thrust**  
 \* New Departure Mfg. Co.

**Bearings, Roller**  
 \* Gwilliam Co.  
 \* Hyatt Roller Bearing Co.  
 \* Norma Co. of America  
 \* Royersford Fdry. & Mach. Co.  
 \* Timken Roller Bearing Co.

**Bearings, Self-Oiling**

\* Brown, A. & F. Co.  
 \* Doehler Die-Casting Co.  
 \* Falls Clutch & Machinery Co.  
 \* Hill Clutch Machine & Fdry. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Royersford Fdry. & Mach. Co.  
 \* Wood's, T. B. Sons Co.

**Bearings, Tapered**  
 \* Timken Roller Bearing Co.

**Bearings, Thrust**  
 \* Fafnir Bearing Co.  
 \* General Electric Co.  
 \* Gwilliam Co.  
 \* Hill Clutch Machine & Fdry. Co.  
 \* Norma Co. of America  
 \* S K F Industries (Inc.)  
 \* Timken Roller Bearing Co.  
 \* Strom Ball Bearing Mfg. Co.

**Belt Dressing**  
 \* Dixon, Joseph Crucible Co.  
 Gandy Belting Co.

**Belt Lacing, Steel**  
 \* Bristol Co.

**Belt Tighteners**  
 \* Brown, A. & F. Co.  
 \* Hill Clutch Machine & Fdry. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Medart Co.  
 \* Smith, F. L. & Co.  
 \* Wood's, T. B. Sons Co.

**Belting, Canvas (Stitched)**  
 Gandy Belting Co.  
 \* United States Rubber Co.

**Belting, Conveyor**  
 Gandy Belting Co.  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.

**Belting, Elevator**  
 Gandy Belting Co.  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.

**Belting, Endless**  
 Gandy Belting Co.

**Belting Fabric**  
 Gandy Belting Co.

**Belting, Leather**  
 American Sole & Belting Leather Tanners (Inc.)

**Belting, Rubber**  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.

**Belting, Waterproof**  
 Gandy Belting Co.

**Bending & Straightening Machines**  
 \* Long & Allstatter Co.

**Bends, Pipe**  
 \* Frick Co. (Inc.)  
 \* Vogt, Henry Machine Co.

**Billets, Steel**  
 \* Timken Roller Bearing Co.

**Blocks, Tackle**  
 \* Clyde Iron Work Sales Co.  
 \* Roebeling's, John A. Sons Co.

**Blowers, Centrifugal**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Coppus Engineering Corp'n  
 \* De Laval Steam Turbine Co.  
 \* General Electric Co.  
 \* Ingersoll-Rand Co.  
 \* Kerr Turbine Co.  
 \* Sturtevant, B. F. Co.  
 \* Westinghouse Electric & Mfg. Co.

**Blowers, Fan**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Coppus Engineering Corp'n  
 \* Greek Fuel Economizer Co.  
 \* Sturtevant, B. F. Co.

**Blowers, Forge**  
 \* American Blower Co.  
 \* Sturtevant, B. F. Co.

**Blowers, Pressure**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Lammert & Mann Co.  
 \* Sturtevant, B. F. Co.

**Blowers, Rotary**  
 Fletcher Works  
 Lammert & Mann Co.  
 \* Schutte & Koerting Co.  
 \* Sturtevant, B. F. Co.

**Blowers, Soot**  
 Diamond Power Specialty Corp'n  
 \* Sturtevant, B. F. Co.

**Blowers, Steam Jet**  
 \* Schutte & Koerting Co.

**Blowers, Turbine**  
 \* Coppus Engineering Corp'n  
 \* Sturtevant, B. F. Co.

**Blueing (Metal)**  
 \* American Metal Treatment Co.

**Boards, Drawing**  
 Dietzgen, Eugene Co.  
 Keuffel & Esser Co.  
 New York Blue Print Paper Co.  
 ParVell Laboratories  
 U. S. Blue Co.  
 Weber, F. Co. (Inc.)

**Boiler Baffles**  
 \* King Refractories Co. (Inc.)  
 \* McLeod & Henry Co.

**Boiler Compounds**  
 \* Dixon, Joseph Crucible Co.  
 Unisol Mfg. Co.

**Boiler Coverings, Furnaces, Tube Cleaners, etc.**  
 (See Coverings, Furnaces, Tube Cleaners, etc., Boiler)

**Boiler Fronts**  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.

**Boiler Settings, Steel Cased**  
 \* Casey-Hedges Co.  
 \* McLeod & Henry Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.

**Boilers, Heating**  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.

**Boilers, Locomotive**  
 \* Casey-Hedges Co.  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.

**Boilers, Marine (Scotch)**  
 Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Casey-Hedges Co.  
 \* Leffel, James & Co.  
 \* Titusville Iron Works Co.  
 \* Walsh & Weidner Boiler Co.

**Boilers, Marine (Water Tube)**  
 \* Babcock & Wilcox Co.  
 Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Casey-Hedges Co.  
 \* Connelly, D. Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Springfield Boiler Co.  
 \* Titusville Iron Works Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Ward, Charles Engineering Wks.

**Boilers, Portable**  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Frick Co. (Inc.)  
 \* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.

**Boilers, Tubular (Horizontal Return)**  
 \* Bigelow Co.  
 \* Casey-Hedges Co.  
 \* Cole, R. D. Mfg. Co.  
 \* Connelly, D. Boiler Co.  
 \* Erie City Iron Works  
 \* Keeler, E. Co.

\* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Ward, Charles Engineering Wks.  
 \* Webster, Howard J.  
 \* Wickes Boiler Co.

**Boilers, Tubular (Vertical Fire)**  
 \* Bigelow Co.  
 \* Casey-Hedges Co.  
 Clyde Iron Works Sales Co.

\* Keeler, E. Co.  
 \* Leffel, James & Co.  
 \* Lidgerwood Mfg. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Titusville Iron Works Co.  
 \* Union Iron Works  
 \* Walsh & Weidner Boiler Co.

**Boilers, Water Tube (Horizontal)**  
 \* Babcock & Wilcox Co.  
 Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Casey-Hedges Co.  
 \* Cole, R. D. Mfg. Co.  
 \* Connelly, D. Boiler Co.  
 \* Edge Moor Iron Co.  
 \* Erie City Iron Works  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.

\* O'Brien, John Boiler Works Co.  
 \* Springfield Boiler Co.  
 \* Union Iron Works  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Wickes Boiler Co.

**Boilers, Water Tube (Inclined)**

\* Babcock & Wilcox Co.  
 Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Bigelow Co.  
 \* Casey-Hedges Co.  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Vogt, Henry Machine Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Ward, Charles Engineering Wks.

**Boilers, Water Tube (Vertical)**

\* Babcock & Wilcox Co.  
 \* Bigelow Co.  
 \* Casey-Hedges Co.  
 \* Erie City Iron Works  
 \* Keeler, E. Co.  
 \* Ladd, George T. Co.  
 \* Morrison Boiler Co.  
 \* O'Brien, John Boiler Works Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Wickes Boiler Co.

**Bolts**  
 \* National Acme Co.

**Boring and Drilling Machines**  
 Universal Boring Machine Co.

**Boring Drilling and Milling Machines (Horizontally Combined)**  
 Universal Boring Machine Co.

**Boxes, Carbonizing**  
 Driver-Harris Co.

**Boxes, Case Hardening**  
 Driver-Harris Co.

**Boxes, Water Service**  
 Murdock Mfg. & Supply Co.

**Brake Blocks**  
 Johns-Manville (Inc.)

**Brakes, Air**  
 \* Allis-Chalmers Mfg. Co.  
 \* General Electric Co.

**Brass Goods**  
 \* Scovill Mfg. Co.

**Brass Mill Machinery**  
 Farrel Foundry & Machine Co.

**Breechings, Smoke**  
 Morrison Boiler Co.  
 \* Titusville Iron Works Co.  
 \* Vogt, Henry Machine Co.

**Brick, Fire**  
 \* Bernitz Furnace Appliance Co.  
 \* Celite Products Co.  
 \* Drake Non-Clinkering Furnace Block Co.

\* Keystone Refractories Co.  
 \* King Refractories Co. (Inc.)  
 \* McLeod & Henry Co.  
 \* Maphite Sales Corp'n

**Brick, Insulating**

 Atlas Car & Mfg. Co.

**Buckets, Clam Shell**  
 McMyler-Interstate Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**Ferro-.** See FERROALLOYS.

**Non-Ferrous.** The Practical Value of Modern Non-Ferrous Alloys, S. F. Barclay. Foundry Trade J., vol. 29, no. 389, Jan. 31, 1924, pp. 85-87, 1 fig. Shows that if founder is to give best service to his customers he needs to know exact use to which his castings will be put, so that he can bring out relevant quality in highest degrees; discusses different alloys.

**ALUMINUM**

**Die Casting.** Die-Casting Aluminum, S. Swan. Metal Industry (Lond.), vol. 24, no. 6, Feb. 8, 1924, p. 123. Chief practical precautions that must be taken for successful casting of aluminum in permanent molds.

**Tensile Strength.** The Tensile Properties of Aluminum at High Temperatures, Thos. Martin. Inst. Metals—advance paper, no. 10, for meeting Mar. 12-13, 1924, 32 pp., 18 pp. Examination of tensile strength at all temperatures up to neighborhood of melting point of metal in its fully annealed state; test on commercial metal; comparison of results with those for pure metal; practical significance of results.

**ALUMINUM ALLOYS**

**Aluminum-Copper.** The Aluminum-Copper Alloys. Alloys of Intermediate Composition, D. Stockdale. Inst. Metals—advance paper, no. 13, for meeting Mar. 12-13, 1924, 16 pp., 4 figs. Study of alloys by thermal and photomicrographic methods; results show that their behavior is even more complex than has been thought, and it is probable that diagram here put forward is only approximately correct.

**Duralumin.** See DURALUMIN.

**ANEMOMETERS**

**Hot-Wire.** The Measurement of Air Flow, R. O. King. Engineering, vol. 117, nos. 3031 and 3034, Feb. 1 and 22, 1924, pp. 136-137 and 249-251, 9 figs. The Callendar hot-wire anemometer, its arrangement for practical use in air measurement, calibration, and comparison with other methods from experimental results.

**Maximum-Wind-Intensity.** A Simple Anemometer for Determining Maximum Intensity of Wind (Un anémomètre à maximum simple), P. L. Mercanton. Nature (Paris), no. 2601, Feb. 23, 1924, pp. 124-126, 2 figs. Describes instrument developed by author.

**ARTILLERY**

**Recoil Mechanisms.** Advantages of Hydro-Pneumatic Recoil Mechanism, D. A. Gurney and W. C. Young. Army Ordnance, vol. 4, no. 22, Jan.-Feb. 1924, pp. 230-233, 3 figs. Greater range and less weight required; standardization; manufacture; service use.

**AUTOGENOUS WELDING**

**Coal-Gas.** Welding with Coal Gas (Schweissen mit Leuchtgasfeuer), Fr. Messinger. Wärme, vol. 47, no. 4, Jan. 25, 1924, pp. 31-32, 6 figs. Autogenous welding and cutting; success of complete welds by means of coal gas without welding medium; welding tests to determine welding limit; experiences with welds in coal-gas fire; tests with low-pressure gas, compressed air and compressed gas.

**AUTOMOBILE ENGINES**

**Assembling Fixture.** Special Fixture Used in Assembling Packard Cylinder Block to Crankcase. Automotive Industries, vol. 50, no. 10, Mar. 6, 1924, pp. 564-565, 3 figs. Preserves alignment standards of connecting rods, pistons, and rings previously installed; device is operated pneumatically and, by simplifying work, makes possible more rapid production.

**Bagnule.** Will Surface-ignition Solve Automobile Oil-engine Problems? Oil Engine Power, vol. 2, no. 2, Feb. 1924, pp. 76-78, 2 figs. Describes Bagnule heavy-oil hot-bulb type of surface-ignition automobile engine; invented by an Italian, and sponsored by Siemens-Schuckert Werke and Allgemeine Elektricitäts-Gesellschaft of Berlin; requires only 20 lb. air per lb. of fuel, weighs only 18 lb. per b.h.p., and regularly consumes 20 deg. B. fuel oil without coking up bulb and at rate of 0.58 lb. b.h.p.hr.

**Balancer.** The Harmonic Balancer, J. N. Morris. Autocar, vol. 52, no. 1478, Feb. 15, 1924, pp. 283-284, 8 figs. Description of device originally introduced by F. W. Lanchester for obtaining, in a 4-cylinder engine of orthodox type, perfection of balance attainable in a 6-cylinder engine, and its action.

**Carburetors.** See CARBURETORS.

**Crankcase-Oil Dilution.** Dilution of the Crank Case Oil of Automotive Engines, C. M. Larson. Armour Engr., vol. 15, no. 2, Jan. 1924, pp. 53-54 and 63, 6 figs. Causes and prevention; results of tests; describes Dilut-O-Meter, and Vis-Gage, instruments for testing life of crankcase oil.

**The Serious Evils of Crankcase-Oil Dilution.** W. F. Parish. Automotive Mfr., vol. 65, no. 11, Feb. 1924, pp. 24-25. Effect of dilution on wear of motor-vehicle engines; statistics of recent replacements; practical improvements in methods; preventing contamination. Abstract of paper read before Automotive Service Assn.

**Detonation, Control of.** Control of Detonation, G. A. Young and J. H. Holloway. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 315-318. Discusses methods of controlling temperature of charge before and after mixture enters combustion chamber, and before normal ignition occurs; results of tests are that, when care is exercised in maintaining mixture, spark plugs, valves and combustion chamber at proper temperature, compression pressure of 125 lb. per sq. in. can be used without detonation by addition of small amount of anti-knock compound to fuel with enough increase in efficiency of engine to warrant additional expense.

**Lubricants, Frictional Losses Due to.** Engines for Oil versus Oil for Engines. Soc. Automotive

Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 307-314, 2 figs. Contains following articles: Mechanical Friction as Affected by the Lubricant, L. H. Pomeroy; The Function of Lubricants, A. L. Clayden.

**Manufacture.** Unusual Tool Grouping Lowers Cost of Nash Engine Production. Automotive Industries, vol. 50, no. 10, Mar. 6, 1924, pp. 559-563, 14 figs. Extra operations resulting in superior finish are made possible on this account; many special machines are employed; cylinders are bored three times, reamed once and honed; 600 blocks can be completed without renewing stones.

**Stock, Specifications for.** American Stock Engine Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 442-445. Tabular data.

**AUTOMOBILE FUELS**

**Production from Solid Fuels.** The Bergius Process. Motor Transport (Lond.), vol. 38, no. 990, Feb. 18, 1924, pp. 183-184, 1 fig. Principle of newly developed method of oil-distillate production from solid fuels.

**Volatility.** Economic Motor-Fuel Volatility, R. Birdsell. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 267-273, 9 figs. Results obtained from acceleration tests made on road and in laboratory, to determine whether rates of acceleration obtainable at any given temperature are different for fuels compared, and whether, when carburetor settings are such as to give maximum acceleration with each fuel, fuel consumption under constant speed and load conditions will be greater with one fuel than with other. Appendix contains analytical description by W. S. James of design of disk used to simulate inertia of car.

**AUTOMOBILE INDUSTRY**

**Standardization.** Tentative Standardization Work. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 338-341. Color code for cable proposed; wire-cloth standard revision; bolt and nut standardization; sheet-steel problems; revision of tube fittings. Reports of Standards Committee of S. A. E.

**AUTOMOBILE MANUFACTURING PLANTS**

**Oil-Fuel Burning.** Burning Oil Fuel in a Ford Motor Co. Plant, A. Murphy. Power House, vol. 17, no. 4, Feb. 20, 1924, pp. 20-21 and 38, 4 figs. Oil-burning forced-circulation hot-water-type heating system installed; high-pressure steam provides source of heat for drying ovens.

**AUTOMOBILES**

**Axles.** New Columbia Axles Designed for Use with Four-Wheel Brakes. Automotive Industries, vol. 50, no. 9, Feb. 28, 1924, pp. 508-509, 2 figs. Steering knuckle is reversed Elliott type and is formed with circular flange to which brake cover plate is secured by six rivets; feature of rear axle is one-piece gear carrier.

**Bentley.** The Three-Litre Bentley. Auto-Motor J., vol. 29, no. 7, Feb. 14, 1924, pp. 137-140, 13 figs. Mechanical details, and equipment. Two inlet and two exhaust valves arranged in each cylinder; 4-cylinder engine of monobloc construction; cylinder bore 80 mm. and piston stroke 149 mm., carrying an R. A. C. rating of 15.9 hp., and capable of propelling standard model vehicle at 75 m.p.h.

**Body Repairs.** Fisher System Places Body Repairs on Par with Chassis Service, W. L. Carver. Automotive Industries, vol. 50, no. 10, Mar. 6, 1924, pp. 572-574, 1 fig. Units and bodies so numbered that replacements can be made on short notice; car distributors are supplied with parts books from which stocks are ordered.

**Calthorpe.** The 12-20 H.P. Calthorpe. Auto-Motor J., vol. 29, no. 5, Jan. 31, 1924, pp. 97-100, 11 figs. Complete description; 4-cylinder engine; will develop 30 hp. at 3200 r.p.m.

**Change Gears.** Change Gear for Automobiles (Wechselgetriebe für Kraftwagen), v. Soden. Maschinbau, vol. 3, no. 8, Jan. 24, 1924, pp. 200-203, 7 figs. Deals with number and stepping of gears.

**Charcoal-Producer-Gas-Burning.** Charcoal-Burning Automobiles (L'Automobile à charbon de bois), A. Troller. Nature (Paris), no. 2601, Feb. 9, 1924, pp. 94-96, 4 figs. Describes Berliet system of using charcoal producer gas for automobiles and motor trucks; shows Berliet car equipped with gas producer which is placed in rear and does not alter general appearance of car.

**Chassis, Experimental.** A Novel Experimental Chassis. Automotive Engr., vol. 14, no. 186, Feb. 1924, p. 45, 2 figs. Complicated design embodying 4-wheel driving, steering and braking.

**Chassis Lubricating System.** Tecalemit. Auto-Motor J., vol. 29, no. 9, Feb. 28, 1924, p. 187, 1 fig. Description of a new high-pressure lubrication system for motor-vehicle chassis, introduced by Tecalemit, Ltd., Lond., Eng., consisting of a grease gun of special type and a special grease plug for parts to be lubricated; can be installed in all cases where usual type of screw-down grease lubricators have been used.

**Darracq.** The 12-23 H.P. Darracq. Auto-Motor J., vol. 29, no. 6, Feb. 7, 1924, pp. 117-120, 12 figs. Monobloc 4-cylinder engine; four-wheel brakes of simple design.

**DeLaunay-Belleville.** The 15.9 H.P. DeLaunay-Belleville. Auto-Motor J., vol. 29, no. 9, Feb. 28, 1924, pp. 181-184, 10 figs. Description of French touring car, having 4-cylinder monobloc engine with 80-mm. bore and a crank throw of 130 mm.; wheel-base 10 ft. 6 in., total length 14 ft., track 4 ft. 8 in.

**Electric, Specifications for.** American Electric Car and Truck Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 422-423. Tables of statistics.

**Essex.** A Six-Cylinder Essex for 1924. Autocar vol. 52, no. 1477, Feb. 8, 1924, pp. 248-249, 7 figs. 16.5 hp. engine.

**Hampton.** The Hampton Car. Auto-Motor J., vol. 29, no. 8, Feb. 21, 1924, pp. 159-162, 11 figs. Describes two models of English car, one of 9-21 hp. and other of 11-35 hp., both similar in general design, both have monobloc 4-cylinder overhead valve engines and clutch and speed-gear integral with engine; 9-21-hp. model has 63-mm. bore and 100-mm. stroke, and 11-35-hp. model, 69-mm. bore and 120-mm. stroke.

**Headlights.** Elliptical Reflector in Egg-Shaped Casing Feature of New Headlamp. Automotive Industries, vol. 50, no. 9, Feb. 28, 1924, p. 520, 3 figs. Beam of light is deformed by lens to inverted fan-shaped section in new headlight brought out by Edmunds & Jones Co., Detroit, Mich.; upwardly diffused light, of amber hue, shows objects in road above lamp level but does not glare.

**Manufacture.** Building 80 Cars a Day in Toronto's Ford Plant, H. P. Armon. Can. Machy., vol. 31, nos. 7 and 8, Feb. 14 and 21, 1924, pp. 15-19 and 13-17, 6 figs. Description of progressive operations involved in assembling cars at the new Danforth Ave. plant of Ford Motor Co. of Toronto, Can., and labor-saving devices used to aid production.

**Riding-Comfort Factors.** Riding-Comfort Factors. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 335-337 and 341. Outline of factors involved in question of riding comfort and discussion thereof.

**Starting and Lighting Equipment.** Electric Starting and Lighting Equipment, A. C. Burgoine. Automobile Engr., vol. 14, no. 186, Feb. 1924, pp. 54-61, 19 figs. What a lighting set consists of; electric starter; standardization of equipment; dynamo drives and regulation; starter mounting and drives; dynamo-coil ignition; future developments.

**AVIATION**

**Progress.** Some Aspects of Aviation, Flight, vol. 16, no. 6, Feb. 7, 1924, pp. 78-79. General discussion on interesting aviation matters, including development of light airplanes in England and progress of aviation in United States. Paper read before Cambridge Univ. Aeronautical Soc.

**Relation to Sea Power.** Relation of Air Power to Sea Power, D. W. Knox. Aviation, vol. 16, no. 9, Mar. 3, 1924, pp. 225-227. Consideration of question as to whether aviation should be taken from cognizance and control of services and be formed into independent air force; air power vs. sea power; effectiveness of aircraft and operating range; accuracy of aerial bombing. Speech delivered to Dist. of Columbia Dept., Reserve Officers' Assn.

**Wind Effect in.** The Effects of Wind in Aviation (Les effets du vent, en aviation), A. Lainé. Génie Civil, vol. 84, no. 5, Feb. 2, 1924, pp. 112-113, 2 figs. Effects of wind on taking off and landing; effects of wind in flight; fog and storms; drag.

**AXLES**

**Automobile, Machining.** A British Method of Building Axles, A. J. Aiers. Am. Mach., vol. 60, no. 12, Mar. 20, 1924, pp. 421-423, 10 figs. Fixtures employed in machining malleable-iron axle housing for 11-hp. car; double-duty fixtures minimize chances for making errors.

**B****BEARING METALS**

**Characteristics.** Bearings and Characteristics of Bearing Metals, W. E. Biggs and W. R. Woolrich. Nat. Engr., vol. 28, no. 3, Mar. 1924, pp. 106-108. Composition and characteristics of different bearing metals; hints on proper procedure in babbitting bearings; points to be considered in selecting a bearing metal.

**BEARINGS**

**Lubrication.** The Proper Lubrication of Modern Industrial Bearings, A. F. Brewer. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 177-183, 9 figs. Discusses characteristics and requirements of each type of bearing.

**Motor, Selection of.** Economies in Selection of Motor Bearings, A. C. Turtle. Ry. Elec. Engr., vol. 15, no. 3, Mar. 1924, pp. 88-91, 5 figs. Consideration of advantages of oil ring bearings and ball bearings; oiling considerations.

**Sleeve.** Some Ways to Cure Sleeve Bearing Troubles, R. Pruger. Indus. Engr., vol. 82, no. 3, Mar. 1924, pp. 113-117, 10 figs. Design and construction of motor sleeve bearings, their advantages, and improvements which have been made to overcome troubles that are sometimes encountered.

**Tests.** Bearing Tests (Lagerversuche), G. Meyer-Jagenberg. Werkstattstechnik, vol. 18, no. 3, Feb. 1, 1924, pp. 41-46, 27 figs. Gives proof of agreement between test results and theory; numerical dependence of bearing friction on working conditions; determination of most suitable oil and calculation of friction corresponding to given working conditions.

**Waste-Packed.** Waste-Packed Bearing Design and Operation, C. Bethel. Elec. Jl., vol. 21, no. 3, Mar. 1924, pp. 115-118, 4 figs. Information regarding oil flow and action of waste packing.

**BEARINGS, ROLLER**

**Railway Cars.** Comparison of Ball and Roller Bearings (Comparaison des paliers à billes et à rouleaux), A. Bijla. Génie Civil, vol. 84, no. 7, Feb. 16, 1924, pp. 159-161, 6 figs. Comparison of two systems in their application to railway rolling stock, showing advantages of roller bearings.

**BEARINGS, THRUST**

**Michell.** Thrust Blocks for the SS. "Empress of

(Pratt & Cady Division)  
\* Vogt, Henry Machine Co.

**Cocks, Blow-off**  
\* Crane Co.  
Lunkenheimer Co.  
\* Pittsburgh Valve, Fdry. & Const. Co.  
\* Reading Steel Casting Co. (Inc.)  
(Pratt & Cady Division)  
\* Reliance Gauge Column Co.

**Cocks, Three-Way and Four-Way**  
\* American Schaeffer & Budenberg Corp'n  
\* Crane Co.  
\* Crosby Steam Gage & Valve Co.  
Lunkenheimer Co.  
\* Pittsburgh Valve, Fdry. & Const. Co.  
\* Reading Steel Casting Co. (Inc.)  
(Pratt & Cady Division)

**Coils, Pipe**  
\* Superheater Co.  
\* Vilter Mfg. Co.  
\* Vogt, Henry Machine Co.

**Coke**  
Pennsylvania Coal & Coke Co.

**Cold Storage Plants**  
\* De La Vergne Machine Co.

**Collars, Shafting**  
Chain Belt Co.  
Hill Clutch Machine & Fdry. Co.  
Link-Belt Co.  
\* Medart Co.  
\* Royersford Fdry. & Mach. Co.  
\* Wood's, T. B. Sons Co.

**Coloring (Metal)**  
\* American Metal Treatment Co.

**Combustion (CO<sub>2</sub>) Recorders**  
\* Sarco Co. (Inc.)  
\* Tagliabue, C. J. Mfg. Co.  
\* Uehling Instrument Co.

**Compressors, Air**  
\* Allis-Chalmers Mfg. Co.  
\* General Electric Co.  
\* Goulds Mfg. Co.  
\* Ingersoll-Rand Co.  
\* Mackintosh-Hemphill Co.  
\* Nordberg Mfg. Co.  
\* Titusville Iron Works Co.  
\* Wayne Tank & Pump Co.  
\* Worthington Pump & Machinery Corp'n

**Compressors, Air, Centrifugal**  
\* De Laval Steam Turbine Co.  
\* General Electric Co.

**Compressors, Air, Compound**  
\* Ingersoll-Rand Co.  
\* Nordberg Mfg. Co.  
\* Worthington Pump & Machinery Corp'n

**Compressors, Ammonia**  
\* Frick Co. (Inc.)  
\* Ingersoll-Rand Co.  
\* Vilter Mfg. Co.  
\* Vogt, Henry Machine Co.  
\* Worthington Pump & Machinery Corp'n

**Compressors, Gas**  
\* De Laval Steam Turbine Co.  
\* General Electric Co.  
\* Ingersoll-Rand Co.  
\* Nordberg Mfg. Co.  
\* Worthington Pump & Machinery Corp'n

**Condensers, Ammonia**  
\* De La Vergne Machine Co.  
\* Frick Co. (Inc.)  
\* Ingersoll-Rand Co.  
\* Vilter Mfg. Co.  
\* Vogt, Henry Machine Co.

**Condensers, Barometric**  
\* Allis-Chalmers Mfg. Co.  
\* Buffalo Steam Pump Co.  
\* Ingersoll-Rand Co.  
\* U. S. Cast Iron Pipe & Fdry. Co.  
\* Wheeler, C. H. Mfg. Co.  
\* Wheeler Condenser & Engrg. Co.  
\* Worthington Pump & Machinery Corp'n

**Condensers, Jet**  
\* Allis-Chalmers Mfg. Co.  
\* Buffalo Steam Pump Co.  
\* Elliott Co.  
\* Ingersoll-Rand Co.  
\* Nordberg Mfg. Co.  
\* Schutte & Koerting Co.  
\* Wheeler, C. H. Mfg. Co.  
\* Wheeler Condenser & Engrg. Co.  
\* Worthington Pump & Machinery Corp'n

**Condensers, Surface**  
\* Allis-Chalmers Mfg. Co.  
Bethlehem Shipbldg. Corp'n (Ltd.)  
Elliott Co.  
\* Ingersoll-Rand Co.  
\* Nordberg Mfg. Co.  
\* Westinghouse Electric & Mfg. Co.  
\* Wheeler, C. H. Mfg. Co.  
\* Wheeler Condenser & Engrg. Co.  
\* Worthington Pump & Machinery Corp'n

**Conduits**  
Johns-Manville (Inc.)

**Controllers, Automatic, for Temperature or for Pressure (See Regulators)**

**Controllers, Electric**  
\* Elwell-Parker Electric Co.  
\* General Electric Co.  
\* Westinghouse Electric & Mfg. Co.

**Controllers, Filter Rate**  
\* Builders Iron Foundry  
\* Simplex Valve & Meter Co.

**Controllers, Liquid Level**  
\* General Electric Co.  
\* Simplex Valve & Meter Co.  
\* Tagliabue, C. J. Mfg. Co.

**Converters, Steel**  
\* Whiting Corporation

**Converters, Synchronous**  
\* Allis-Chalmers Mfg. Co.  
\* General Electric Co.  
Ridgway Dynamo & Engine Co.  
\* Westinghouse Electric & Mfg. Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

Australia." Engineering, vol. 117, no. 3035, Feb. 29, 1924, pp. 268-269, 9 figs. on p. 272. Describes installation of modified form of Michell thrust, utilizing existing thrust shaft, and fitting into existing housing.

#### BLAST-FURNACE GAS

**Cleaning.** Practical Tests on a Blast-Furnace-Gas Wet-Cleaning Plant (Betriebsversuche an einer Hochfengas-Nassreinigungsanlage), M. Steffes. Stahl u. Eisen, vol. 44, no. 4, Jan. 24, 1924, pp. 92-96, 14 figs. Results of six-day tests; determination of best operating conditions; degree of purification; water and power consumption and efficiency of different plants.

#### BLAST FURNACES

**Low- vs. High-Pressure Blowing.** Relation between Cross Section of a Blast Furnace and Its Manner of Blowing (Relation entre le profil d'un fourneau et son mode de soufflage), M. Derclaye. Revue Universelle des Mines, vol. 1, no. 3, Feb. 1, 1924, pp. 146-184, 7 figs. Investigation to determine whether manner of blowing, that is, at low or high pressure, has relation to cross-section of blast furnace; characteristics of different types of blast furnaces; comparison between low-shaft and tall-shaft furnaces, showing advantages of former, with low-pressure blowing.

#### BLOWERS

**Turbo.** Turbo-Blowers for the New Royal Dutch Works, P. Ostertag. Iron & Coal Trades Rev., vol. 108, no. 2917, Jan. 25, 1924, pp. 133-134, 7 figs. Describes construction and enumerates results of tests carried out on one of three blast-furnace blowers delivered by Escher Wyss & Co., Zurich, Switzerland, to order of Kon. Ned. Hoogovens & Staalfabriek at The Hague. Translated from Schweizer. Bauzeitung.

#### BOILER FEEDWATER

**Regulators.** Mechanical Control of Boiler Feed Water, C. E. Wolff. Power Plant Eng., vol. 28, no. 5, Mar. 1, 1924, pp. 277-278, 4 figs. Points out that diverse demands of engineers in feedwater-regulation practice are being met by modern regulators, and sets forth requirements which must exist in regulators for effective results.

**Treatment.** The Cost of Boiler Feed Water, J. T. Beard. 2nd. Paper, vol. 33, no. 16, Feb. 7, 1924, pp. 5-7, 2 figs. Cost of impurities in boiler feedwater, and notes on methods of treatment, including softening.

#### BOILER FURNACES

**Air Preheating for.** Air Preheating, F. Dawson. Eng. & Boiler House Rev., vol. 37, no. 8, Mar. 1924, pp. 274-276, 5 figs. Brief review of present state of development.

**Draft.** Draught and its Effects on the Working and Efficiency of Boilers, J. T. Ruddock. Eng. & Boiler House Rev., vol. 37, no. 8, Mar. 1924, pp. 279-281, 1 fig. Deals with plants working with induced or chimney draft only; shows necessity for securing necessary draft pressure in combustion chamber itself. From paper read before Elec. Power Engrs. Assn.

**Gas-Fired.** Combustion in Gas-Fired Boiler Furnaces, Heat Transmission in Refractory Brick, and the Problem of Heat-Storage Linings (Ueber die Verbrennung in Gasbrennern, den Wärmeübergang an feuerfesten Stein und über die Frage der Wärmespeicherungsmauerung), H. Lent. Wärme, vol. 47, nos. 3, 4 and 5, Jan. 18, 25 and Feb. 1, 1924, pp. 24-26, 33-37 and 45-49, 18 figs. Describes experimental pipe section for investigating phenomena in furnace and in combustion chamber in the burning of blast-furnace gas under different conditions; also temperature along pipe section and heat-transmission conditions.

**Oil-Fired.** Burning Oil Under Power Boilers, R. F. Burke. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 328-330, 3 figs. Points out that localization of heat in furnace must be avoided if brickwork and boiler maintenance are to be kept low; flame impingement causes tube failures; short flame may result from high per cent. of excess air.

**Turbine.** The "Turbine" Forced Draught Furnace, Electrician, vol. 92, no. 2386, Feb. 8, 1924, p. 164, 2 figs. Description of a steam jet furnace made by Turbine Furnace Co., employing low-grade fuel.

#### BOILER HOUSES

**Control.** Records and Efficiency at a London Power Station. Eng. & Boiler House Rev., vol. 37, no. 8, Mar. 1924, pp. 269-270 and 272, 4 figs. Notes on methods of boiler-house control at Central Elec. Supply Co., Ltd., London.

#### BOILER OPERATION

**Draft Regulation.** The Craig System of Better Draft Control. Steam Power, vol. 2, no. 12, Jan. 1924, pp. 7 and 10, 1 fig. Describes Craig regulator and its operation; automatically maintains a constant over-fire draft by controlling position of uptake damper.

**To Regulate Fuel Expense.** Control Draft, Jas. T. Beard. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 331-334, 6 figs. Points out that height of stack limits strength of draft; stokers are more efficient than grates; correctness of air supply indicated by CO<sub>2</sub> percentage.

#### BOILERMAKING

**Methods.** Modern Boilermaking Methods. Eng. Production, vol. 7, no. 138, Mar. 1924, pp. 78-81, 8 figs. Describes works and procedure of Davey, Paxman, & Co., Ltd., Colchester, Eng., makers of all types of steam boilers.

#### BOILERS

**Accidents.** Peculiar Cases of Accidents to Containers and Boiler Parts (Eigenartige Zerstörungen von Gefässen und Kesselteilen), M. Grellert. Gesundheits-Ingenieur, vol. 47, no. 7, Feb. 16, 1924, pp. 49-52, 4 figs. Gives a number of concrete examples showing that accidents are often due to causes other

than those assumed or anticipated; all the cases cited were due to inadequate calculation of design or to careless construction.

**Exhaust-Gas.** Waste Exhaust Gases of Low-Powered Oil Engines. Oil Engine Power, vol. 2, no. 2, Feb. 1924, pp. 90-91, 2 figs. Design and results of two types of small exhaust-gas boilers, one for a 2-cycle surface-ignition unit and other for a 4-cycle Diesel engine.

**Locomotive.** See LOCOMOTIVE BOILERS.

#### BOILERS, WATER-TUBE

**Two-Flow Ring-Circuit.** The Kidwell Two-Flow Ring-Circuit Boiler. Pac. Mar. Rev., vol. 21, no. 2, Feb. 1924, p. 119, 1 fig. Boiler is said to introduce entirely new principle of arrangement in water-tube boilers.

**Types.** Water-tube Boilers, C. C. Pounder. Mech. World, vol. 75, nos. 1932 and 1936, Jan. 11 and Feb. 8, 1924, pp. 26-27 and 84-86, 6 figs. Description of various types.

#### BOLTS

**Tension Calculation.** Charts for Tension in Bolts and Torsion in Shafts, E. Patterson. Am. Mach., vol. 60, no. 11, Mar. 13, 1924, pp. 401-402, 2 figs. Two simple alignment charts intended to provide quick solutions for problems in stresses.

#### BRAKES

**Air.** A Review of Power Brake Operation and the Results Obtained on the Southern Pacific, J. Kruttschnitt. Ry. & Locomotive Eng., vol. 37, no. 3, Mar. 1924, pp. 72-74. Developed in testimony before Interstate Commerce Commission.

**I. C. C. Continues the Brake Investigation.** Ry. Age, vol. 76, no. 10, Mar. 8, 1924, pp. 551-554. Am. Ry. Assn. observers disagree with Bur. of Safety report on Norfolk & Western tests of automatic straight air brakes.

#### BRASS

**Annealing, Effect of.** Effect of Anneal on Brass Surfaces, J. L. Christie. Iron Age, vol. 113, no. 11, Mar. 13, 1924, pp. 783-785, 6 figs. High ductility obtained only by losing smoothness; grain size under microscope a measure of both ductility and amount of annealing.

**Brittle Ranges.** The Brittle Ranges in Brass as Shown by the Izod Impact Test, D. Bunting. Inst. Metals—advance paper, no. 2, for meeting Mar. 12-13, 1924, 22 pp., 15 figs. Investigates (1) brittle ranges of brass varying in composition from 100 to 50 per cent copper; (2) effect of rapid cooling on brittle ranges; (3) cause of brittle ranges.

**Dezincification.** A Further Study of the Dezincification of Brass, C. F. Nixon. Am. Electrochem. Soc.—advance paper, no. 3, for meeting, Apr. 24-26, 1924, pp. 29-41, 2 figs. From experimental evidence it is concluded that, with exception of 90 per cent, or more, copper alloys, commercial brasses are subject to dezincification.

**Heat Treatment.** Relation of Heat Treatment to the Microstructure of 60-40 Brass, R. S. Williams and V. O. Homerberg. Am. Inst. Min. & Met. Engrs.—Trans., No. 1305-N, Mar. 1924, 15 pp., 40 figs. Description of a double heat treatment of 60-40 brass; gives photomicrographs showing changes that take place in microstructure on reheating water-quenched specimens.

**Relation of Heat Treatment, Mechanical Properties, and Microstructure of 60-40 Brass, V. O. Homerberg and D. N. Shaw.** Am. Inst. Min. & Met. Engrs.—Trans., No. 1334-N, Mar. 1924, 10 pp., 16 figs. Results obtained when test pieces were given a double heat treatment and then tested for mechanical properties, and microstructure studied.

#### BRASS FOUNDRIES

**Improving Conditions in.** Humanizing Brass Foundries, Chas. Vickers. Foundry, vol. 52, no. 5, Mar. 1, 1924, pp. 185-189, 5 figs. Points out that unattractive features often serve to deter men from taking up brass-casting work; suggests eliminating noise and fumes.

#### BRONZES

**Cold Drawing and Annealing, Effect of.** Note on the Effect of Cold-Drawing and Annealing on Some Electrochemical Properties of a Low-Tin Bronze, S. H. J. Wilson. Inst. Metals—advance paper, no. 14, for meeting Mar. 12-13, 1924, 11 pp., 5 figs. Investigation which is result of discovery by Alkins of a critical range in curve relating the amount of cold work received by copper or bronze wire to several physical properties.

**Sand-Cast Zinc.** The Effect of Casting Temperature on the Physical Properties of a Sand-Cast Zinc-Bronze, F. W. Rowe. Inst. Metals—advance paper, no. 12, for meeting Mar. 12-13, 1924, 6 pp., 8 figs. Investigation to determine, for works use, optimum casting temperature to give required mechanical properties in gun metal of composition specified.

## C

#### CABLEWAYS

**Longitudinal Profile.** The Equilibrium Profile of Cableways (Das Gleichgewichtsprofil der Seilbahn), H. H. Peter. Schweizerische Bauzeitung, vol. 83, no. 5, Feb. 2, 1924, pp. 58-59. Simplified method of determining advantageous longitudinal profile, the so-called theoretical (ideal, compensated) or equilibrium profile.

#### CALORIMETERS

**Iron-Mercury.** An Iron-Mercury Calorimeter, F. H. Schofield. J. of Sci. Instruments, vol. 1, no. 5, Feb. 1924, pp. 141-144, 4 figs. Describes calorimeter which is specially suitable for measuring specific heat of materials of low thermal conductivity which react with water.

#### CAR LIGHTING

**Head-End System.** Head-End Car Lighting System of the St. Paul, C. R. Gilman. Ry. Elec. Engr., vol. 15, no. 3, Mar. 1924, pp. 73-76, 11 figs. Description of head-end system, as used for electric lighting of passenger trains on Chicago, Milwaukee & St. Paul in contrast with individual car-axle system. Running repairs and electric-fan repairs made.

#### CAR WHEELS

**Tire Fractures.** The Cause of Tire Fractures (Ueber die Ursache von Radreifenbrüchen), W. Marzahn. Glaser's Annalen, vol. 94, no. 4, Feb. 15, 1924, pp. 37-41, 7 figs. Investigations of broken wheel tires showing causes due to faults in material and in workmanship; preventive measures to be observed in steel works and workshop.

**Wrought-Steel, Gaging of.** Gaging Wrought Steel Wheels for Car and Tender, A. Knapp. Ry. Mech. Engr., vol. 98, no. 3, Mar. 1924, pp. 164-167, 13 figs. Discussion on use of new A. R. A. steel wheel gage for determining defects, turning wheels and billing. Abstract of paper before Car Foremen's Assn. of Chicago.

#### CARBURETORS

**Characteristics of Ideal and Commercial.** Comparison of Ideal and Commercial Carburetor Characteristics, C. S. Kegerreis. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 286-301, 21 figs. Computed data illustrate car carburetion requirements of various cars for level-road operation; results of car-test data procured from various sources show information regarding advisability of using straight-line mixtures; data on commercial carburetors; summary of 23 carburetors tested for general conclusions; results give information on effect of air temperatures on metering; 11 devices are compared with ideal carburetor at various car speeds.

#### CARS, FREIGHT

**Gondola, Hopper-Bottom.** 57 1/2-Ton Hopper Bottom Gondola for C. & O. Ry. Mech. Engr., vol. 98, no. 3, Mar. 1924, pp. 161-164, 6 figs. Are stronger and of greater capacity than previous cars of same weight; steel construction; length 31 ft. 6 in., width 10 ft., height from rail to top of body 11 ft.

**Grain.** New 40-Ton Bogie Wagons for South African Railways. Ry. Gaz., vol. 40, no. 6, Feb. 8, 1924, p. 167, 2 figs. Principal data of all-steel cars to be used for conveyance of grain in bulk from farming districts to S. African ports; for 3-ft. 6-in. gage; arranged for end or bottom discharge.

**Hart Convertible.** New Ballast Cars of the Michigan Central R. R. Ry. Rev., vol. 74, no. 10, Mar. 8, 1924, pp. 435-438, 4 figs. Describes Hart convertible car; can be used as a gondola or dump car in ordinary traffic; capacity of 50 tons.

**Rapid Construction.** Bangor & Aroostook Car Building Contest. Ry. Age, vol. 76, no. 9, Mar. 1, 1924, pp. 511-513, 6 figs. Box cars, including trucks, completed by two crews in total time of 94 man-hours each.

#### CARS, PASSENGER

**Steel.** All-Steel Carriages for Sydney Suburban Railways, Commonwealth Engr., vol. 11, no. 5, Dec. 1, 1923, pp. 175-178, 2 figs. Description of car bodies ordered from Leeds Forge Co., England, by New South Wales railway department; contract covers only complete shell of car body, including doors, windows and partitions, but exclusive of bogies, couplings and draft gear, seats, parcel racks and other furnishings, which will be manufactured locally.

**Suburban.** Missouri Pacific Acquires Light Suburban Cars. Ry. Age, vol. 76, no. 15, Mar. 15, 1924, pp. 747-749, 4 figs. Design provides strength of through passenger coach; weighs 1000 lb. per seated passenger.

#### CARS, REFRIGERATOR

**Ventilated.** Ventilated Rock Island Refrigerator Cars. Ry. Age, vol. 76, no. 10, Mar. 8, 1924, pp. 547-549, 5 figs. Special attention given to method of insulating in cars built by Gen. Am. Car Co., Chicago; Acme ventilation system installed.

#### CARS, TANK

**Can. Pacific Ry.** New Tank Cars for Canadian Service. Ry. Rev., vol. 74, no. 8, Feb. 23, 1924, pp. 324-327, 3 figs. Description of cars built by Can. Pacific Ry. to A. R. A. Class III specifications; tank capacity 12,480 gal.

#### CAST IRON

**Carbon Control.** States Carbon Control Theory, A. C. Porter. Foundry, vol. 52, no. 5, Mar. 1, 1924, pp. 194-195. Sulphur to manganese ratio said to exert regulating influence on amount of carbon in gray cast iron and on ratio of combined to graphitic carbon.

**Gas and Oxygen Determination.** Gas and Oxygen Determinations in Iron, Especially Cast Iron (Ueber Gas- und Sauerstoffbestimmungen im Eisen, insbesondere Gusseisen), P. Oberhoffer, E. Piwowarsky, A. Pfeifer-Schiessl and H. Stein. Stahl u. Eisen, vol. 44, no. 5, Jan. 31, 1924, pp. 113-116, 5 figs. Oxygen contents in low-carbon steel and cast iron; determination of oxygen from gas contents through hot extraction in vacuum; influence of oxygen contents on properties of cast iron.

**Manufacture.** The History of the Manufacture

Manufactured by  
Advertisers**CLASSIFIED LIST OF MECHANICAL EQUIPMENT**Alphabetical List

of Cast Iron. T. Makemson. *Foundry Trade J.*, vol. 29, no. 392, Feb. 21, 1924, pp. 153-157. Ancient iron workers; ironmaking in Middle Ages, discovery and early uses of cast iron; early use of coke; evolution of blast furnace and foundry; etc.

**Sulphur, Influence on.** The Influence of Sulphur on Cast Iron (Der Einfluss des Schwefels auf das Gusseisen), C. Röber. *Praktischer Maschinen-Konstrukteur*, vol. 57, no. 1-2, Jan. 8, 1924, pp. 5-6. Means of reducing sulphur content in finished products; injurious effects of high sulphur content in finished castings; calorimetric determination of sulphur according to Eggertz method.

**Welding.** Expansion in Iron Castings, D. Richardson. *Welding Engr.*, vol. 9, no. 2, Feb. 1924, pp. 19-20, 4 figs. How distribution of mass in casting determines correct procedure in preheating.

## CASTINGS

**Bronze Autoclave Body.** Making Bronze Autoclave Body, David Whyte. *Metal Industry (Lond.)*, vol. 24, no. 8, Feb. 22, 1924, pp. 174-175, 2 figs. Method of producing sound hydraulic castings of this type of following alloy: 85 Cu, 13 Sn, 1 Zn.

## CENTRAL STATIONS

**Inspection.** Periodic Power-Plant Inspection. *Power*, vol. 59, no. 11, Mar. 11, 1924, pp. 404-405. List of general instructions issued by Fed. Light & Traction Co., New York City, to managers of their subsidiary companies.

**Manchester, England.** The Barton Power-Station of the Manchester Corporation, and the Transmission System in Connection therewith, H. N. Allott and S. L. Pearce. *Instn. Civ. Engrs.—Sessional Notices*, no. 3, Feb. 1924, pp. 62-64. Site can accommodate 165,000 kw. of plant, whereof first section consists of 82,500 kw.; details of station equipment. (Abstract.)

**Victoria, Australia.** New Power Plant for Geelong, Vic., Electricity Supply. *Commonwealth Engr.*, vol. 11, no. 4, Nov. 1, 1923, pp. 137-144, 5 figs. Describes condensing water, generating units, boilers, and distributing system; involves generation of 6000 to 6600 volts, 3-phase, 50 frequency.

**Weymouth, Mass.** Some Engineering Features of the Weymouth Station of the Edison Electric Illuminating Company of Boston, I. E. Moulthrop and J. Pope. *Universal Engr.*, vol. 39, no. 2, Feb. 1924, pp. 14-23, 8 figs. Brief description of station and its equipment, with discussion of engineering features of more timely interest; initial main generating equipment to consist of two 32,000-kw. turbines each driving a main 30,000-kw. generator and a 2000-kw. auxiliary generator direct-connected to shaft of main generator.

## CHARTS

**Application in Industry.** Application of Charts in Industry, D. B. Porter. *Mgt. & Administration*, vol. 7, nos. 1 and 3, Jan. and Mar. 1924, pp. 65-72, 12 figs.; and 329-336, 10 figs. Jan.: Management-data summary; presents historical charts drawn chiefly from fields of sales and financial data. Mar.: Application of charts which show frequency with which events occur under conditions of non-historical nature.

## CHROME-NICKEL STEEL

**Deoxidation, Influence of.** The Influence of Deoxidation on Hot-Working Capacity and Properties of a Chrome-Nickel Structural Steel (Der Einfluss der Deoxidation auf die Warmverarbeitbarkeit und die Eigenschaften eines Chromnickel-Baustahles), W. Oertel and L. A. Richter. *Stahl u. Eisen*, vol. 44, no. 7, Feb. 14, 1924, pp. 169-175, 5 figs. Investigation of cracks; influence of casting temperature and speed, rolling temperature, and time required for heating rolling material; deoxidation and distillation; properties of steel produced under different conditions.

## CLUTCHES

**Automobile.** A New Flexible Coupling Device (Un nouveau dispositif d'accouplement flexible), E. Guillaume. *L'Industrie des Tramways*, vol. 18, no. 305, Jan. 1924, pp. 11-14, 3 figs. Describes elastic device which is claimed to have many advantages over universal joint; gives results of tests and explains adaptation of this transmission to automobiles.

**American Stock Clutch and Axle Specifications.** *Automotive Industries*, vol. 50, no. 8, Feb. 21, 1924, pp. 446-450. Tabular data.

**Construction and Uses.** Construction Details and Use of Clutches and Cutoff Couplings, F. E. Gooding. *Indus. Engr.*, vol. 82, nos. 1 and 2, Jan. and Mar. 1924, pp. 5-9 and 127-130, 29 figs. Construction and operation of friction and magnetic clutches and cut-off couplings, and information necessary when ordering and installing them.

## COAL

**Recovery from Ashes.** Fuel Recovery From Pan Ash. *Gas J.*, vol. 165, no. 3167, Jan. 23, 1924, pp. 200-201, 3 figs. Description of dry-magnetic ash-separating process and equipment.

## COAL HANDLING

**Loaders.** One More Mechanical Loader Comes to Light. *Coal Age*, vol. 25, no. 9, Feb. 28, 1924, pp. 305-306, 2 figs. Wilson chain loader for low coal weighs 4000 lb. and has maximum height of 32 in.; it has loaded 69 tons of coal a day and 120 tons of loose gob.

## COLD STORAGE

**Plants.** Refrigeration at French Ports. *Cold Storage*, vol. 27, no. 311, Feb. 21, 1924, pp. 47-48, 2 figs. Notes on layout and equipment of Bordeaux-Bassens dock stores.

**Washington's Storage Plant.** *Refrig. World*, vol. 50, no. 1, Feb. 1924, pp. 13-18, 14 figs. Describes

new warehouse and raw-water ice plant of Terminal Refrig. & Warehousing Co.

## COMBUSTION

**Molar Calculation.** The Molar Calculation of Combustion Processes with Use of Nomograms (Die molare Berechnung von Verbrennungsvorgängen unter Verwendung von Nomogrammen), W. Otte. *Wärme*, vol. 47, no. 2, Jan. 11, 1924, pp. 11-14, 5 figs. Advantages of molar calculation; formulas; use of nomograms in connection with molar calculation of combustion processes; examples.

## COMPRESSED AIR

**Meters.** Compressed-Air Meters (Pressluftmesser), A. Grossmann. *Maschinenbau*, vol. 3, no. 9, Feb. 14, 1924, pp. 249-250, 4 figs. Comparisons between compressed-air meters with and without shock-absorbing air chamber; points to incorrect results obtained with meters when compressed-air tool is directly attached, and favorable results obtained by attachment of shock-absorbing air chamber.

## CONDENSERS, STEAM

**Performance of, Checking.** Condenser Performance, J. Bruce. *Elec. Rev.*, vol. 94, no. 2410, Feb. 1, 1924, pp. 164-166, 6 figs. Describes simple and easily applicable methods for checking condenser performance of generating set in few moments, and also system whereby continuous tabulated and graphical record of such performance can be recorded from day to day, showing behavior of plant at glance.

**Surface.** Efficient Operation of Surface Condensing Plant. *Elec. Times*, vol. 65, no. 1085, Jan. 31, 1924, pp. 117-119, 1 fig. Suggestions in regard to efficient operation; chart for determination of partial pressure of air under varying conditions of vapor temperature and absolute pressure.

**Surface Condenser Operation.** C. S. Tomlinson. *Elec. Light & Power*, vol. 2, no. 3, Mar. 1924, pp. 13-14, 60 and 62, 2 figs. Gives two formulas which can be used in studying condenser operation and shows how to apply them.

## CONVEYORS

**Continuous vs. Intermittent.** Continuous Versus Intermittent Conveyors and Handling Methods, G. F. Zimmer. *Indus. Mgt. (Lond.)*, vol. 11, no. 3, Feb. 7, 1924, pp. 77-80, 4 figs. General distinguishing features of the two systems; possibility of increasing capacity of an existing conveyor installation; comparison between working costs; continuous and intermittent industrial methods; etc.

**Pulverized Material.** Fuller-Kinyon System of Conveying Pulverized Coal and Other Materials. *Indus. Mgt. (Lond.)*, vol. 11, no. 4, Feb. 21, 1924, pp. 103-106, 4 figs. Description of system whose outstanding characteristics are simplicity, safety and cleanliness.

## COOLING TOWERS

**Calculation.** The Calculation of Cooling Towers (Berechnung von Kühltürmen), C. Geibel. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 7, Feb. 16, 1924, pp. 152-153, 1 fig. Setting up heat equations with aid of which cooling-plant values can be determined; points out that laws of current, speed of evaporation and state of outgoing air are unknown conditions which must be determined.

**Steel.** Cooling Towers for Steam Condensing Plant. *World Power*, vol. 1, no. 2, Feb. 1924, pp. 119-123, 6 figs. Recent designs of steel cooling towers manufactured by Worthington-Simpson, Ltd., for which many advantages are claimed.

## COPPER ALLOYS

**Copper-Aluminum.** X-Ray Studies on the Copper-Aluminum Alloys, E. R. Jette, G. Phragmén and A. F. Westgren. *Inst. Metals—advance paper*, no. 9, for meeting Mar. 12-13, 1924, 14 pp., 7 figs. X-ray analysis has confirmed previous knowledge that at ordinary temperature four different stable phases appear in this system.

**Copper-Cadmium.** The Constitution of the Alloys of Copper and Cadmium, C. H. M. Jenkins and D. Hanson. *Inst. Metals—advance paper*, no. 8, for meeting Mar. 12-13, 1924, 16 pp., 33 figs. Deals with determination of constitution of alloys of cadmium with copper, especially in solid state; copper and cadmium in liquid state are mutually soluble in all proportions.

**Copper-Tin.** On the Equilibrium Diagram of the Copper-Tin System, T. Ishihara. *Inst. Metals—advance paper*, no. 7, for meeting Mar. 12-13, 1924, 31 figs. Equilibrium diagram of copper-tin system is obtained by means of electric resistance measurement; alpha constituent shows progressive transformation beginning at 480 to 580 deg. cent. according to concentration of tin; maximum solubility of tin in alpha is determined to be 11 per cent at room temperature.

**Copper-Zinc.** On the Copper-Zinc Alloys Which Expand on Solidification, Kei Iokibe. *Inst. Metals—advance paper*, no. 6, for meeting Mar. 12-13, 1924, 27 pp., 12 figs. Amount of expansion depends upon percentage of copper and rate of cooling; force of expansion is of considerable magnitude; hardness and elastic limit of expanded alloys are low, and contain cracks and voids; inverse segregation and how its effect can be diminished; cause of inverse segregation.

## CORROSION

**Zinc and Lead.** The Relative Corrosion of Zinc and Lead in Solutions of Inorganic Salts, J. N. Friend and J. S. Tidmus. *Inst. Metals—advance paper*, no. 4, for meeting Mar. 12-13, 1924, 9 pp., 4 figs. Influence of alkali salts upon relative rates of corrosion of zinc and lead closely resembles that already observed in case of iron; satisfactory explanation can be offered to account for this.

## COST ACCOUNTING

**Executives.** Industrial Cost Accounting for Ex-

ecutives, P. M. Atkins. *Am. Mach.*, vol. 60, nos. 6, 7, 9, 10, 11 and 12, Feb. 7, 21, 28, Mar. 6, 13 and 20, 1924, pp. 201-204, 287-290, 329-333, 353-356, 403-406 and 433-434, 1 fig. Feb. 7: Standard practice instructions; installing system of cost accounts. Feb. 21: Design of forms to be used in facilitating keeping of cost records. Feb. 28: Coordination of cost records and general accounts. Mar. 6: Cost statistics and two methods of their visualized presentation; comparative reports. Mar. 13: Cost-accounting service to production control; auditing work of planning department; comparative cost data for foreman. Mar. 20: factory control by means of cost accounts; analyzing qualities of executive.

**Inventory Methods.** Keeping Perpetual Plant Inventory, W. C. Sponenburgh. *Telephony*, vol. 86, no. 7, Feb. 16, 1924, pp. 21-23. Method, employed by Glen Telephone Co., Gloversville, N. Y., found most helpful in preparing reports for state tax and public-service commissions. Paper read before N. Y. Up-State Telephone Assn.

**Job Costing.** A Simple System of Job Costing. *Mar. Engr. & Nav. Architect*, vol. 47, no. 557, Feb. 1924, pp. 66-67, 2 figs. Costing as a science; cost-recording essentials; labor rate and materials rate; prime cost cards.

**COUPLINGS.** See CLUTCHES.

## CRANES

**Combination Pile Driver and.** Combination Heavy Duty Crane and Pile Driver, Ry. Age, vol. 76, no. 15, Mar. 15, 1924, pp. 757-758, 2 figs. Machine built by Brown Hoisting Co. for Northern Pacific is capable of driving piles straight ahead or on either side of track; it may be revolved 360 deg. in either direction and piles may be driven at any point within circumference of 32-ft. circle.

**Electric.** Electric Level-Luffing Cranes, W. A. Perry. *Elec. Rev.*, vol. 94, no. 2412, Feb. 15, 1924, pp. 248-249, 2 figs. Describes 7-ton dockside cranes supplied to Ardrossan Harbor Co., Scotland.

## CUPOLAS

**Practice.** A Day at the Cupola, A. R. Bartlett. *Foundry Trade J.*, vol. 29, no. 389, Jan. 31, 1924, pp. 89-92. Describes operations of a day at cupola of foundry with which author is connected. See Discussion in *Foundry Trade J.*, Feb. 7, 1924, pp. 113-116, 1 fig.

## CURVES

**Fitting.** The Development of a Frequency Function and Some Comments of Curve Fitting, E. B. Wilson. *Nat. Acad. Sci.—Proc.*, vol. 10, no. 2, Feb. 1924, pp. 79-84, 2 figs. Author describes method of determining his own fit which, he claims, has desirable characteristic that it suggests at once a working hypothesis.

## CYLINDERS

**Castings for.** Cylinder Castings, O. Smalley. *North-East Coast Instn. Engrs. & Shipbldrs.—advance paper* no. 2669S, for meeting, Feb. 1, 1924, 30 pp., 26 figs. Deals with cause and elimination of commoner defects encountered in manufacture of cylinder castings.

# D

## DIESEL ENGINES

**Bethlehem.** The Bethlehem Two Cycle Diesel Engine. *Mar. News*, vol. 10, no. 10, Mar. 1924, pp. 75-78 and 95, 11 figs. Particulars of new Bethlehem oil engine which is of vertical, two-stroke cycle, single-acting type, constructed in units of 4, 6 or 8 cylinders and running at a speed of from 116 r.p.m. for land power and twin-screw marine installations down to 90 r.p.m. for single-screw marine use. Notes on 6-cylinder two-cycle oil engine developing 2500 s.h.p. at 90 r.p.m., installed on motorship Cubore.

**Combustion Phenomena in.** Combustion Phenomena in Diesel Engines (Verbrennungsvorgänge im Dieselmotor), H. v. Wartenberg. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 7, Feb. 16, 1924, pp. 153-154. Explains cause for poorer ignition and tendency to soot formation with burning of tar oils in Diesel engines, and points out that combustion can be accelerated by much finer breaking up of drops, probably through admixture of large quantities of water emulsified in oil, and through employment of higher temperatures in compression space.

**Heat Losses.** Investigations of Diesel Engines (Untersuchungen an der Dieselmachine), K. Neumann. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 4, Jan. 26, 1924, pp. 77-80, 5 figs. Thermodynamic circle process and working losses; heat diagrams of engine for complete and incomplete expansion; calculation of heat-transmission coefficient for combustion and expansion independent of piston diagram.

**Heavy-Oil, for Motorcycles.** A New Heavy-Oil Engine for Motorcycles (Ein neuer Fahrzeug-Schweröl-motor), E. Frey and C. Fischer. *Motorwagen*, vol. 27, no. 2-3, Jan. 20-31, 1924, pp. 28-29, 2 figs. Describes compressorless Diesel engine which can be operated with all kinds of oil fuel, including crude, paraffin, lignite-tar and shale oil, as well as with light fuel oils, such as gasoline, benzol, alcohol and petroleum, without making any changes in engine.

**Knudsen.** Knudsen Diesel. *Pac. Mar. Rev.*, vol. 21, no. 2, Feb. 1924, p. 115, 3 figs. Two-cycle engine of opposed-piston type, but with cylinders set on acute angle with common combustion chamber at their upper end.

**Marine.** Plan New Diesel for Big Output. *Mar. Rev.*, vol. 54, no. 3, Mar. 1924, pp. 114-116, 5 figs.

  - \* Reliance Gauge Column Co.
  - \* Simplex Valve & Meter Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

Description of 6-cylinder 4-cycle crosshead-type Diesel engine developing 2000 i.h.p. at a maximum of 100 r.p.m. with a 30-in. bore and 48-in. stroke, installed on Suphenco.

The Maintenance of Marine Internal-Combustion Engines. Mar. Engr. & Nav. Architect, vol. 47, no. 557, Feb. 1924, pp. 53-54. Working and operation of marine Diesel engines considered practically.

Opposed-Piston. Palmer's 3,000 s.h.p. Opposed-Piston Diesel Engine. Motorship, vol. 9, no. 2, Feb. 1924, pp. 118-119, 1 fig. Single-screw unit for 10,000-ton single-screw tanker, constructed on Fullagar principle with air injection.

Pipe-Line, Lubrication of. Pipe Line Diesels and Their Lubrication, F. Thilenius. Oil Engine Power, vol. 2, no. 2, Feb. 1924, pp. 67-76, 13 figs. Developments carried out on Prairie Pipe Lines. Describes new system which utilizes all available exhaust heat in conjunction with reclaimers, purifiers, and special filters, combined into standard units and eliminates all lubricating troubles.

Valve Setting. Setting the Valves of a Diesel Engine, H. F. Birnie and R. C. Baumann. Power Plant Engr., vol. 28, no. 4, Feb. 15, 1924, pp. 230-232, 6 figs. Setting fuel cams.

## DISKS

Rotating, Calculation of. Calculation of Rotating Disks (Le Calcul des disques tournants), P. Caufourier. Génie Civil, vol. 84, no. 1, Jan. 5, 1924, pp. 15-17, 4 figs. Discusses Prudon, Pigeaud, and Stodola-Arrowsmith methods and describes rational method of employing Arrowsmith calculation.

## DRILLING MACHINES

Multiple-Spindle. Multiple-spindle Drilling Machines. Machy. (Lond.), vol. 23, no. 593, Feb. 7, 1924, pp. 609-612, 6 figs. New tools operating on time cycle, more particularly for operation on railway-car details.

## DURALUMIN

Improvement Process. The Researches on the Duraluminum Problem, W. Fraenkel and E. Scheuer. Testing, vol. 1, no. 1, Jan. 1924, pp. 33-39. Explains peculiarity of process of improvement, and gives hypothesis reached by authors, namely, that cause of improvement is explained as chemical reaction in quenched alloy taking place in forming solid solution.

## DYNAMOMETERS

Types. Some New Dynamometers, J. S. G. Primrose. Mech. World, vol. 75, no. 1936, 1937 and 1938, Feb. 8, 15 and 22, pp. 87-88, 100-102, and 115-116, 7 figs. Review of some of the more modern means of measuring force, contrasting them with some of the older forms which are better known. Paper read before Manchester Assn. of Engrs.

# E

## ELECTRIC DRIVE

Machine Tools. A New Reversing-Gear Arrangement for Individual Electric Drives (Eine neue Umsteuertriebeanordnung für elektrischen Einzelantrieb), E. Lauer-Schmaltz. Maschinenbau, vol. 24, no. 8, Jan. 24, 1924, pp. 203-206, 7 figs. Describes two different designs of new type of motor, the flywheel ring motor, which together with a new system of mechanical reversing arrangement, offers advantages for transmission of larger amounts of power.

## ELECTRIC FURNACES

Heat Treating. Electric Furnace Proves Best, J. Watson. Elec. World, vol. 83, no. 8, Feb. 23, 1924, p. 376, 1 fig. Special application for hardening clipper plates proves very economical; costs and operating results.

## ELECTRIC LOCOMOTIVES

Paris-Orleans Ry. High Speed Passenger Locomotive for Paris-Orleans Railway, W. D. Bearce. Gen. Elec. Rev., vol. 27, no. 3, Mar. 1924, pp. 146-150, 3 figs. Detailed description of gearless 120-ton locomotive; nominal voltage of system 1500 volts d.c.

Siemens-Schuckert. The Siemens-Schuckert Locomotives on the Swedish Riksbahn (Die Siemens-Schuckert-Lokomotiven auf der schwedischen Riksbahn), F. Kuntze. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 4, Jan. 26, 1924, pp. 72-76, 21 figs. Brief outline of first IC + CI locomotives of Swedish railway and results obtained therewith; description of new IC + CI locomotives and their ability to meet stringent requirements made on them.

The Siemens-Schuckert-Locomotives of the Swedish State Railways (Riksbahn), F. Kuntze. Eng. Progress, vol. 5, no. 1, Jan. 1924, pp. 1-4, 6 figs. Details of ore-train twin locomotives of IC + CI type.

Vibrations. The Vibrations on Electric Locomotives with Crank Drive (Die Schüttelerschneinungen elektrischer Lokomotiven mit Kurbelantrieb), Iwan Döry. Elektrotechnik u. Maschinenbau, vol. 42, no. 4, Jan. 27, 1924, pp. 45-47, 3 figs. Discusses causes of periodic vibration and indicates that play in bearings is largely responsible for it; fact that vibrations occur under no load as well as at full load tends to support authors' conclusions; use of properly placed springs in gear mechanism is means for avoiding vibrating and resonating phenomena.

## ELECTRIC WELDING

Precision. One More Step in Electric Welding Progress, S. W. Mann. Am. Welding Soc.—Jl., vol. 3, no. 1, Jan. 1924, pp. 18-23, 2 figs. Discusses precision welding; describes process of repairing a crankshaft, which was accomplished at very great saving.

## ELECTRIC WELDING, ARC

Problems and Uses. Electric Arc Welding (Aus der Werkstatt des Lichtbogenschweißers), A. Hochstimm. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 6, Feb. 9, 1924, pp. 129-132, 18 figs. Discusses useful field of arc welding; peculiarities of d.c. and a.c. arc welding; training of welders; and results obtained.

Sheet-Metal Parts. Arc Welding Sheet-Metal Parts, A. R. Luechinger. Am. Mach., vol. 60, no. 12, Mar. 20, 1924, pp. 425-427, 6 figs. What constitutes good welding; proper methods of welding different kinds of seams; how operators should be trained; use of fixtures in production welding.

Welders, Training of. Training Course for Electric Arc Welders. Am. Welding Soc.—Jl., vol. 3, no. 2, Feb. 1924, pp. 15-47. Analysis of work of an arc welder; qualifications for welders; some of the fundamentals in arc welding, together with a detailed statement of material classified under type welding jobs arranged in order of difficulty from standpoint of teaching.

## ELEVATORS

Hand and Power. The Design and Construction of Hand and Power Elevators. Mech. Wld., vol. 75, nos. 1932, 1934, 1937 and 1939, Jan. 11, 25, Feb. 15 and 29, 1924, pp. 24-25, 49-51, 98-100 and 129-130, 13 figs. Deals with elevators for raising or lowering goods of solid form between basement and intervening floors of a building or factory.

## EMPLOYEES

Individual Differences of. What Makes Employees Differ? D. A. Laird. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 184-190, 5 figs. Discusses from point of view of present-day science factors connected with individual differences with which employer should be familiar.

## EMPLOYEES, TRAINING OF

Evening School. Helping the Worker by Education, S. W. Ashe. Machy. (N. Y.), vol. 30, no. 7, Mar. 1924, pp. 524-525. How evening school at Pittsfield Works of Gen. Elec. Co. provides educational opportunities for employees.

## ENAMELING

Cast-Iron Ware. European Practice in the Manufacture of Enamelled Cast Iron Ware, J. Grunwald. Am. Ceramic Soc.—Jl., vol. 7, no. 2, Feb. 1924, pp. 118-121. Review of European practice, particularly as employed in Austria and Germany.

## ENERGY

Conservation. New Ways of Conserving Energy (Neue Wege der Energiewirtschaft), Löffler. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 8, Feb. 23, 1924, pp. 161-169, 18 figs. Present-day utilization of fuel energy; examples from mining and metallurgical, chemical and automotive industries; saving effected through high speed, high pressure and temperature drops; control of state of heat, especially through cooling; Diesel engines for trucks; electrical and mechanical power transmission in automobiles; gas and oil turbines; high-pressure steam turbines and boilers; use of high pressure and high temperature in chemical industry—refinement of fuel, liquefaction of coal; principles of modern high-pressure design and operation.

Utilization of Natural Sources. Contribution to the Theory of the Utilization of Natural Power Sources (Beitrag zur Theorie der Ausnützung von Naturkräften), Rob. I. Novotny. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 5, Feb. 2, 1924, pp. 101-106, 11 figs. Influence of working time and idleness of power plant on utilization of energy contained in a natural power source; improving power utilization and increasing efficiency by use of energy storage; comparison of cost of power generation with and without storage of energy.

## ENGRAVING MACHINES

Design. Engraving Machines (Graviermaschinen), I. Braren. Werkstattstechnik, vol. 18, no. 3, Feb. 1, 1924, pp. 47-51, 15 figs. Study of construction elements peculiar to such machines and information on a number of new solutions of problems involved.

# F

## FANS

Mine. Experiments on the Distribution of Air in Centrifugal Fans and on Re-entry Phenomena, H. Briggs and J. M. Williamson. Colliery Guardian, vol. 127, no. 3295, Feb. 22, 1924, pp. 465-466, 21 figs. Experiments made at Heriot-Watt College, Edinburgh, and at Wellesley Colliery, Fife, bearing upon manner in which centrifugal fan of drum type deals with air it discharges; shows how uneven is distribution of air passing through wheel; different forms of re-entry of air. Paper read before North of Eng. Inst. Min. & Mech. Engrs.

Support and Drive. Auxiliary Equipment for Blast and Ventilating Fans, Chas. L. Hubbard. Power, vol. 59, no. 9, 26, 1924, pp. 318-321, 6 figs. Methods of supporting fan and drive to meet various conditions; preventing vibration; air velocities; engine and turbine drives; d.c. and a.c. motor drives; speed regulation with motor drive.

Ventilators and Exhausters. Ventilators and Exhausters (Ventilatoren und Exhaustoren), H. R. Karg. Praktischer Maschinen-Konstrukteur, vol. 56, nos. 46-47 and 50-51, Nov. 27 and Dec. 24, 1923, and vol. 57, nos. 1-2 and 5, Jan. 8 and Feb. 5, 1924, 13 pp., 3 figs. Nov. 27: Critical discussion and recommenda-

tions. Dec. 24: Openings and admission velocities. Jan. 8: Determination of inside and outside blade angles. Feb. 5: Determination of speed of admission of gases in vane wheel.

## FERROALLOYS

Development and Uses. Ferro-Alloys, Fr. M. Becket. Chem. & Met. Eng., vol. 30, nos. 5, 8 and 10, Feb. 4, 25 and Mar. 10, 1924, pp. 186-188, 316-318 and 391-393. Feb. 4: Story and uses of ferro-silicon; status of industry; metallic silicon. Feb. 25: Developments and utility of ferrochromium. Mar. 10: Ferroalloys of tungsten and vanadium.

## FLOUR MILLS

Diesel-Engine-Driven. America's Largest Diesel-Driven Flour Mill. Oil Engine Power, vol. 2, no. 2, Feb. 1924, pp. 80-84, 4 figs. How Red Star Mill, Wichita, Kans., effected pronounced economies by gradually discarding old steam machinery in favor of modern oil-engine power, which rendered them independent of local electric supply.

## FLOW OF WATER

Pipes and Channels. The Flow of Water in Pipes and Channels, F. Heywood. Instn. Civ. Engrs.—Sessional Notices, no. 3, Feb. 1924, pp. 67-68. Attempt to coordinate available data relating to flow of water in conduits with entirely satisfactory results of tests on small-scale experimental pipe lines. (Abstract.)

## FLOWMETERS

Electrically-Operated. The Electrically Operated Flow Meter, R. E. Woolley. Gen. Elec. Rev., vol. 27, no. 3, Mar. 1924, pp. 182-187, 8 figs. Reasons that gave rise to its development; description of complete device, function of its parts, its general principle of operation, and its applications.

## FOREMEN

Training. Some Psychological Aspects of Foremanship Training, F. Cushman. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 174-176. Responsibilities of foremen and methods of discharging them.

## FORGING

Copper. Distillery Apparatus in a Coppersmithing Shop, H. P. Armon. Can. Machy., vol. 31, no. 10, Mar. 6, 1924, pp. 27-30, 3 figs. Description of methods employed in making large sectional drums, pipe connections, etc., at Booth-Coulter Copper & Brass Co.'s plant, Toronto, Can.

Steel Shafts. The Rough Turning of Forgings (De dégrossissage des pièces de forge sur le tour), N. Sawine. Génie Civil, vol. 84, no. 5, Feb. 2, 1924, pp. 110-112. Discusses best working conditions for steel shafts.

## FOUNDRIES

American vs. European Practice. American Versus European Foundry Practice, H. M. Lane. Iron Age, vol. 113, no. 11, Mar. 13, 1924, pp. 803-804. Comparison based on relative, social and economic conditions; light building construction; machine-tool design.

Brass. Impressions of British Brass Foundries, T. Harper. Metal Industry (N. Y.), vol. 22, no. 2, Feb. 1924, pp. 60-63. British efficiency as seen by an American brass foundryman and jobbing foundry operator.

Flasks. Notes on Moulding Boxes, G. Hoffmann. Foundry Trade Jl., vol. 29, no. 391, Feb. 14, 1924, pp. 129-131, 19 figs. Requirements and design of flasks; design of bars; wrought-iron flasks. Translated from Die Giesserei.

Pneumatic Tools. Increasing Foundry Output With Compressed Air, R. G. Skerrett. Can. Foundryman, vol. 15, no. 2, Feb. 1924, pp. 22-27, 18 figs. How compressed air and pneumatic tools make it possible for foundryman to do more and better work than would be possible without these modern aids.

## FREIGHT HANDLING

L. C. L. Freight. Departure in Handling Less than Carload Freight, E. F. Ford. Ry. Rev., vol. 74, no. 8, Feb. 23, 1924, pp. 320-321. Description of new method which reduces overtime, loss and damage and conserves equipment.

How English Cartage Practice Prevents Terminal Congestion, F. C. Horner. N. Y. Railroad Club-Official Proc., vol. 34, no. 3, Feb. 1924, pp. 7212-7222 and (discussion) 7222-7225. Description of English system of collection and delivery of l.c.l. freight.

## FUELS

Factory Refuse. Generation of Power with Factory Refuse, F. Johnstone-Taylor. Power Plant Engr., vol. 28, no. 6, Mar. 15, 1924, pp. 326-328, 3 figs. Wood wastes and other refuse used for generating steam and producer gas; description of suction-gas producer; operating results; gas storage, boiler firing by gas.

Research. The Work of the Fuel Research Board, C. H. Lander. Instn. Min. Engrs.—Trans., vol. 64, Pt. 5, Feb. 1924, pp. 243-253 and (discussion) 253-261. Physical and chemical survey of national coal resources; carbonization of coal; structure of coke; water gas; gasoline mixtures for motor-car engines; hydrogenation of oils and coals; domestic heating; peat; alcohol; etc.

[See also COAL; OIL FUELS; PULVERIZED COAL.]

## FURNACES, ANNEALING

Steel Wire. Furnaces for Wire Annealing. Fuels & Furnaces, vol. 2, no. 3, Mar. 1924, pp. 245-246, 4 figs. Coal-fired pot furnaces for black and bright annealing and recuperative furnaces of German design.

## FURNACES, HEATING

Sheet and Pair. Modern Sheet and Pair Furnaces

# Manufactured by **CLASSIFIED LIST OF MECHANICAL EQUIPMENT** Alphabetical List on page 174

## Manufactured by Advertisers

**Gages, Water Level**  
 \* American Schaeffer & Budenberg Corp'n  
 \* Bristol Co.  
 \* Lunkenheimer Co.  
 \* Simplex Valve & Meter Co.

**Gas Plant Machinery**  
 \* Cole, R. D. Mfg. Co.  
 \* Steere Engineering Co.

**Gaskets**  
 \* Garlock Packing Co.  
 \* Jenkins Bros.  
 \* Johns-Manville (Inc.)  
 \* Sarco Co. (Inc.)

**Gaskets, Iron, Corrugated**  
 \* Smooth-On Mfg. Co.

**Gaskets, Rubber**  
 \* Garlock Packing Co.  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.

**Gates, Ash**  
 \* Baker Dunbar Co.

**Gates, Blast**  
 \* American Blower Co.  
 \* Steere Engineering Co.

**Gates, Cut-off**  
 \* Easton Car & Construction Co.  
 \* Link-Belt Co.

**Gates, Sluice**  
 \* Chapman Valve Mfg. Co.  
 \* Pittsburgh Valve, Fdry. & Const. Co.

**Gear Blanks**  
 \* Cann & Saul Steel Co.

**Gear Cutting Machines**  
 \* Jones, W. A. Fdry. & Mach. Co.

**Gear Hobbing Machines**  
 \* Jones, W. A. Fdry. & Mach. Co.

**Gears, Bakelite**  
 \* Ganschow, Wm. Co.

**Gears, Cut**  
 \* Brown, A. & F. Co.  
 \* Chain Belt Co.  
 \* Hill Clutch Machine & Fdry. Co.  
 \* De Laval Steam Turbine Co.  
 \* Farrel Foundry & Machine Co.  
 \* Fawcus Machine Co.  
 \* Foote Bros. Gear & Machine Co.  
 \* James, D. O. Mfg. Co.  
 \* Johnson, Carlyle Machine Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Mackintosh-Hemphill Co.  
 \* Medart Co.  
 \* Philadelphia Gear Works

**Gears, Fibre**  
 \* General Electric Co.  
 \* James, D. O. Mfg. Co.

**Gears, Grinding**  
 \* Farrel Foundry & Machine Co.

**Gears, Helical**  
 \* Farrel Foundry & Machine Co.

**Gears, Herringbone**  
 \* Falk Corporation  
 \* Farrel Foundry & Machine Co.  
 \* Fawcus Machine Co.

**Gears, Machine Molded**  
 \* Brown, A. & F. Co.  
 \* Farrel Foundry & Machine Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.

**Gears, Micarta**  
 \* Westinghouse Elec. & Mfg. Co.

**Gears, Rawhide**  
 \* Farrel Foundry & Machine Co.  
 \* Ganschow, Wm. Co.  
 \* James, D. O. Mfg. Co.  
 \* Philadelphia Gear Works

**Gears, Speed Reduction**  
 \* Chain Belt Co.  
 \* De Laval Steam Turbine Co.  
 \* Falk Corporation  
 \* Farrel Foundry & Machine Co.  
 \* Fawcus Machine Co.  
 \* Foote Bros. Gear & Machine Co.  
 \* Ganschow, Wm. Co.

 \* Kerr Turbine Co.  
 \* Link-Belt Co.  
 \* Sturtevant, B. F. Co.  
 \* Westinghouse Electric & Mfg. Co.

**Gears, Steel**  
 \* Hill Clutch Machine & Fdry. Co.

**Gears, Worm**  
 \* Chain Belt Co.  
 \* Cleveland Worm & Gear Co.  
 \* Fawcus Machine Co.  
 \* Foote Bros. Gear & Machine Co.  
 \* Ganschow, Wm. Co.  
 \* Gifford-Wood Co.  
 \* James, D. O. Mfg. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.

**Generating Sets**  
 \* Allis-Chalmers Mfg. Co.  
 \* American Blower Co.  
 \* Clargage Fan Co.  
 \* Coppus Engineering Corp'n  
 \* De Laval Steam Turbine Co.  
 \* Engberg's Electric & Mech. Wks.  
 \* General Electric Co.  
 \* Kerr Turbine Co.  
 \* Ridgway Dynamo & Engine Co.  
 \* Sturtevant, B. F. Co.  
 \* Westinghouse Electric & Mfg. Co.

**Generators, Electric**  
 \* Allis-Chalmers Mfg. Co.  
 \* De Laval Steam Turbine Co.  
 \* Engberg's Electric & Mech. Wks.  
 \* General Electric Co.  
 \* Nordberg Mfg. Co.  
 \* Ridgway Dynamo & Engine Co.  
 \* Westinghouse Electric & Mfg. Co.

**Governors, Air Compressor**  
 \* Foster Engineering Co.  
 \* Mason Regulator Co.

**Governors, Engine, Oil**  
 \* Nordberg Mfg. Co.

**Governors, Engine, Steam**  
 \* Nordberg Mfg. Co.

**Governors, Oil Burner**  
 \* Foster Engineering Co.  
 \* Mason Regulator Co.

**Governors, Pressure**  
 \* Tagliabue, C. J. Mfg. Co.

**Governors, Pump**  
 \* Bowser, S. F. & Co. (Inc.)  
 \* Edward Valve & Mfg. Co.  
 \* Foster Engineering Co.  
 \* Kieley & Mueller (Inc.)  
 \* Mason Regulator Co.  
 \* Squires, C. E. Co.  
 \* Tagliabue, C. J. Mfg. Co.

**Governors, Steam Turbine**  
 \* Foster Engineering Co.

**Governors, Water Wheel**  
 \* Worthington Pump & Machinery Corp'n

**Granulators**  
 \* Smith, F. L. & Co.

**Graphite, Flake (Lubricating)**  
 \* Dixon, Joseph Crucible Co.

**Grate Bars**  
 \* Casey-Hedges Co.  
 \* Combustion Engineering Corp'n  
 \* Erie City Iron Works Co.  
 \* Titusville Iron Works Co.  
 \* Vogt, Henry Machine Co.

**Grate Bars (for Overfeed and Underfeed Stokers)**  
 \* Furnace Engineering Co.

**Grates, Dumping**  
 \* Combustion Engineering Corp'n  
 \* Titusville Iron Works Co.  
 \* Vogt, Henry Machine Co.

**Grates, Shaking**  
 \* Casey-Hedges Co.  
 \* Combustion Engineering Corp'n  
 \* Erie City Iron Works Co.  
 \* Springfield Boiler Co.  
 \* Titusville Iron Works Co.  
 \* Vogt, Henry Machine Co.

**Grating, Flooring**  
 \* Irving Iron Works Co.

**Grease Cups**  
 \* (See Oil and Grease Cups)

**Grease Extractors**  
 \* (See Separators, Oil)

**Greases**  
 \* Dixon, Joseph Crucible Co.  
 \* Roversford Fdry. & Mach. Co.  
 \* Vacuum Oil Co.

**Grinding Machinery**  
 \* Brown, A. & F. Co.  
 \* Smith, F. L. & Co.

**Grinding Machinery, Knife**  
 \* American Machine & Foundry Co.

**Grinding Machines, Chaser**  
 \* Landis Machine Co. (Inc.)

**Grinding Machines, Floor**  
 \* Builders Iron Foundry  
 \* Roversford Fdry. & Mach. Co.

**Grinding Machines, Tool**  
 \* National Acme Co.

**Gun Metal Finish**  
 \* American Metal Treatment Co.

**Hammers, Drop**  
 \* Franklin Machine Co.  
 \* Long & Allstatter Co.

**Hammers, Pneumatic**  
 \* Ingersoll-Rand Co.

**Handles, Machine, Steel**  
 \* Rockwood Sprinkler Co.

**Hangers, Shaft**  
 \* Brown, A. & F. Co.  
 \* Chain Belt Co.  
 \* Falls Clutch & Machinery Co.  
 \* Hill Clutch Machine & Fdry. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Medart Co.  
 \* Roversford Fdry. & Mach. Co.  
 \* Wood's, T. B. Sons Co.

**Hangers, Shaft (Ball Bearing)**  
 \* Hyatt Roller Bearing Co.  
 \* S K F Industries (Inc.)

**Hangers, Shaft (Roller Bearing)**  
 \* Hyatt Roller Bearing Co.  
 \* Jones, W. A. Fdry. & Mach. Co.

**Hard Rubber Products**  
 \* United States Rubber Co.

**Hardening**  
 \* American Metal Treatment Co.

**Heat Exchangers**  
 \* Coll-Reynolds Engineering Co.

**Heat Treating**  
 \* American Metal Treatment Co.

**Heaters, Feed Water (Closed)**  
 \* Bethlehem Shipbldg. Corp'n (Ltd.)  
 \* Coll-Reynolds Engineering Co.  
 \* Erie City Iron Works  
 \* Schutte & Koerting Co.  
 \* Walsh & Weidner Boiler Co.  
 \* Wheeler, C. H. Mfg. Co.  
 \* Wheeler Cond. & Engrg. Co.  
 \* Worthington Pump & Machinery Corp'n

**Heaters, Feed Water, Locomotive (Open)**  
 \* Worthington Pump & Machinery Corp'n

**Heaters and Purifiers, Feed Water, Metering**  
 \* Cochran Corp'n

**Heaters and Purifiers, Feed Water (Open)**  
 \* Cochran Corp'n  
 \* Elliott Co.  
 \* Erie City Iron Works  
 \* Hoppes Mfg. Co.  
 \* Springfield Boiler Co.  
 \* Wickes Boiler Co.  
 \* Worthington Pump & Machinery Corp'n

**Heating and Ventilating Apparatus**  
 \* American Blower Co.  
 \* American Radiator Co.  
 \* Clargage Fan Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

Described, A. W. Peters. *Fuels & Furnaces*, vol. 2, no. 3, Mar. 1924, pp. 227-230, 2 figs. Well-insulated one-valve control furnaces effect saving of 43 per cent in gas consumption over old furnaces and secure uniform and controllable furnace atmosphere.

#### FURNACES, HEAT-TREATING

**Gas vs. Oil-Fired Hardening.** Gas vs. Oil Firing for Hardening Plants (Gas- oder Oelfeuerung für Härteanlagen), Fr. Messinger. *Wärme*, vol. 11, no. 2, Jan. 11, 1924, pp. 15-16, 5 figs. Reconstruction of salt-bath hardening furnace by changing from oil to gas firing; hardening and maintenance of temperature; reduction of size of annealing chamber underneath crucible with gas firing; arrangement of burner; positive regulation of gas-air mixture; results with regard to time required for starting fire, hourly rate of fuel consumption, and quantity of heat consumed.

#### FURNACES, REVERBERATORY

**Iron and Steel.** Reverberatory Furnaces for Heating Iron and Steel, W. Mason. *Metal Industry* (Lond.), vol. 24, no. 8, Feb. 22, 1924, pp. 177-178, 4 figs. Chief practical details of design, control, and repair of ordinary reverberatory furnace, and principal faults in operation.

## G

#### GAGES

**Special.** Special Gages (Sonderlehren), E. Schuchardt. *Maschinenbau*, vol. 3, no. 9, Feb. 14, 1924, pp. 240-244, 32 figs. Points out that in addition to standard gages for standard parts as accepted by German industrial Standards Committee, there are special gages for special parts; author seeks to develop standard guides for special gages adhering strictly to gage system.

#### GAS ANALYSIS

**Orsat Apparatus.** The Technical Analysis of High-Quality Gases with the Orsat Apparatus (Die technische Analyse von hochwertigen Gasen mit dem Orsatapparat), W. Stöckmann. *Stahl u. Eisen*, vol. 44, no. 6, Feb. 7, 1924, pp. 153-154. Describes method for joint combustion of methane and hydrogen with pure oxygen.

**Thermal-Conductivity Method.** Thermal Conductivity for the Analysis of Gases, P. E. Palmer and E. R. Weaver. U. S. Bur. Standards, *Technologic Papers No. 249*, Jan. 7, 1924, 100 pp., 40 figs. By a comparison of resistance of two electrically-heated wires surrounded, respectively, by gas for analysis and a reference gas, a determination is possible of concentration of certain constituents in a wide variety of gas mixtures of importance in industry and research. Results of an investigation with this method.

#### GAS ENGINES

**Tests.** Gas-engine Trials, N. Harwood. *Mech. World*, vol. 75, no. 1935, Feb. 1, 1924, p. 65, 3 figs. Describes trials undertaken with object of investigating whether clearance space in a gas engine is wholly or partly filled every suction stroke.

**Vertical.** Vertical Gas Engines (Les moteurs à gaz verticaux), J. Brunswick. *Technique Moderne*, vol. 16, no. 1, Jan. 1, 1924, pp. 7-10, 12 figs. Describes various types manufactured in different countries.

#### GAS PRODUCERS

**Double-Grate.** A New Method for Improvement of Gas Furnaces Directly Connected with Gas Producer (Ein neuer Weg zur Verbesserung der mit dem Generator in unmittelbarer Verbindung stehenden Gasfeuerungen), J. Hüdler. *Gas- u. Wasserfach*, vol. 67, no. 2, Jan. 12, 1924, pp. 16-18, 2 figs. Describes patented double-grate producer which has a second combustion hearth directly over step grate, and points out its economic advantages.

#### GASES

**Cylinders, Safe Handling of.** Rules for the Safe Handling of Gas Cylinders. *Am. Mach.*, vol. 60, no. 12, Mar. 20, 1924, p. 424. Rules prepared by Gas Products Assn., Chicago, for handling of cylinders containing compressed oxygen, hydrogen and acetylene.

**Dust Removal.** Separating Dust from Gases with Dust, Geo. B. Cramp. *Chem. & Met. Eng.*, vol. 30, no. 10, Mar. 10, 1924, pp. 400-401, 2 figs. System primarily developed by author for blast-furnace gases, but which should be effective and useful elsewhere, employs dust from gas as filtering medium for filtering out more dust.

**The Elimination of Chimney Discharges by Means of Electric Gas Cleaning (Die Beseitigung des Schornstein-Ansarfs mittels elektrischer Gasreinigung), H. Schroeder.** *Feuerungstechnik*, vol. 12, nos. 9 and 10, Feb. 1 and 15, 1924, pp. 65-66 and 73-77, 7 figs. Losses through soot, coke- and flue-dust particles, and their removal by means of flue-dust separators; describes Oski process and installation for gas cleaning and dust removal; its advantages, working costs, arrangement, and useful scope.

#### GEAR CUTTING

**Bevel Gears.** The Cutting of Bevel Gears on the Universal Milling Machine (Das Fräsen von Kegelrädern auf der Universalfräsmaschine), M. Raudnitz. *Werkstattstechnik*, vol. 18, no. 5, Mar. 1, 1924, pp. 135-141, 24 figs. Development of method, based on theoretical investigation of a bevel-gear tooth face, according to which bevel gears can be generated on universal milling machine with side-milling cutter, without aid of special devices, and more nearly approaching theoretically correct form.

**The Cutting of Bevel Gears with Profile Cutters (Schneiden von Kegelrädern mit Formfräsern).** *Werkstattstechnik*, vol. 18, no. 5, Mar. 1, 1924, pp. 156-158, 7 figs. Adjustment of cutter and bevel-gear rings; cutting of gear segments and of double-angle bevel gears. See also articles entitled Rough Turning of Bevel Gears (Schruppen von Kegelrädern), pp. 158-161, 11 figs.; and Cutting of Spiral Bevel Gears with Worm Hobbs (Fräsen von Spiralkegelrädern mit Schneckenfräsern), pp. 161-167, 16 figs.

#### GEARS

**Bevel.** Gear Machining (Zahnradbearbeitung), G. Olah. *Werkstattstechnik*, vol. 18, no. 5, Mar. 1, 1924, pp. 121-134, 44 figs. Describes different methods and machines for producing bevel gears.

**Helical.** The Graphical Solution of Helical Gear Problems, F. Szabo. *Am. Mach.*, vol. 60, no. 11, Mar. 13, 1924, pp. 391-394, 11 figs. Method for investigating characteristics of helical gearing; approximate solution to problem easily obtainable; trial calculations eliminated; method adapted to all conditions.

**Marine.** A Basis for the Explanation of Marine Gearing Troubles, Wm. Sellar. *Inst. Mar. Engrs.—Trans.*, vol. 35, Feb. 1924, pp. 525-570, 63 figs. It is shown that as gears become more accurately cut the more likely will twist and bending of pinion be counted as responsible for troubles that may arise, and author advises designers to look further into subject of bending and twisting of pinion.

**Reversing, Tooth Position for.** Calculation of Tooth Position for Spur-Wheel Reversing Gear (Berechnung der Räderstellung für Stirnräderwendegetriebe), K. Hoecken. *Maschinenbau*, vol. 3, no. 8, Jan. 24, 1924, pp. 197-200, 4 figs. For reversing gear with axially movable and disengageable change wheels, position of teeth when changing is calculated which is necessary to permit the engagement of teeth.

**Spur.** Spur-Gear Machining (Stirnräderbearbeitung), Barth. *Werkstattstechnik*, vol. 18, no. 4, Feb. 15, 1924, pp. 75-98, 119 figs. Describes different methods and machines for producing spur gears.

**Teeth, Evolution of.** Historical Notes on Gear Teeth, L. D. Burlingame. *Machy.* (N. Y.), vol. 30, no. 7, Mar. 1924, pp. 529-534, 10 figs. Evolution of gear teeth from crude beginnings and early equipment for cutting.

#### GRINDING MACHINES

**Gear.** A New Full-Automatic Gear Grinder. *Eng. Production*, vol. 7, no. 137, Feb. 1924, pp. 41-43, 6 figs. Details of involute gear grinder placed on market by Fellows Gear Shaper Co., Springfield, Vt.

## H

#### HARDNESS

**Ball Testing Method.** Ball Method of Hardness Testing and Its Importance Today in the Evaluation of Metallic Materials (La prova di durezza alla sfera e la sua importanza nell'odierno collaudo dei materiali metallici), V. Prever. *Ingegneria*, vol. 3, no. 1, Jan. 1, 1924, pp. 16-21, 10 figs. partly on supp. plate. Deals with load employed in penetration test and its influence in Brinell number; duration of application of load; influence of diameter of ball employed; ball deformation; and relation between hardness and tensile strength. Results obtained on carbon and alloy steels at research laboratory of Fiat Company in Turin.

#### HEATING AND VENTILATING

**Theaters.** Modern Ventilating in Theater Building, M. J. Phillips. *Plumbers' Trade J.*, vol. 76, no. 5, Mar. 1, 1924, pp. 406-408 and 455, 7 figs. Description of installation, at Fort Armstrong Theater, Rock Island, Ill., including system for heating in cold weather and cooling in summer months.

#### HEATING, HOUSE

**Oil Burners.** Oil Burners for Residential Property, A. C. Carruthers. *Safety Eng.*, vol. 47, no. 2, Feb. 1924, pp. 60-64, 3 figs. Principal data on ten oil burners, for installation in various types of hot-water heaters, steam boilers, and hot-air furnaces, which have received approval of Underwriters' Laboratories. Regulations issued for their construction and use.

**Vapor.** Vapor Heating System For Small Dwellings, T. E. Mason. *Plumbers' Trade J.*, vol. 76, no. 4, Feb. 15, 1924, pp. 330-331 and 334, 4 figs. Details of an actual installation in representative building situated in high-altitude territory.

#### HEATING, STEAM

**Oil-Burning System.** Oil Burning Equipment, M. Griffith. *Plumbers' Trade J.*, vol. 76, no. 4, Feb. 15, 1924, pp. 326-329, 7 figs. Details of storage tanks, apparatus and piping installation for large office building in accordance with requirements of Nat. Board of Fire Underwriters.

**Practice.** Modern Steam Heating, A. J. Asheton. *Domestic Eng.* (Lond.), vol. 44, nos. 1 and 2, Jan. and Feb. 1924, pp. 3-10, and 33-35, 12 figs. Discusses decomposition of air impurities and purities; course of convection currents; object of air eliminator; pipe sizes; vapor, mechanical return, and vacuum systems.

#### HOBBIING MACHINES

**Spline.** Sommer & Adams Rotary Spline Hobbing Machine. *Machy.* (N. Y.), vol. 30, no. 7, Mar. 1924, pp. 555-556, 3 figs. Describes multiple-spindle machine in which eight pieces of work are finished by as many hobs, while practically entire machine, with exception of base, revolved past operator; it is believed same principle can be applied to hobbing of gears.

#### HOISTS

**Electric.** An Electric Hoist Controlled by Com-

pressed Air, H. V. Haight. *Can. Min. J.*, vol. 45, no. 8, Feb. 22, 1924, pp. 175-180, 8 figs. Particulars of two hoists recently built for use in Porcupine camp; double-drum type, the two drums being on one shaft and intended for operating normally in balance; both drums provided with band friction clutches so that either may be operated independently; drive is through single-reduction Falk herringbone gearing; 250-hp. 550-volt 60-cycle slip-ring hoist motor; designed for maximum rope pull of 12,000 lb. and a depth of 2000 ft.

**Electric Drives for Mine Hoists.** L. A. Umansky. *Coal Industry*, vol. 7, no. 2, Feb. 1924, pp. 75-82, 13 figs. Economic comparison of various systems in use; induction-motor drive and Ward-Leonard control with flywheel motor generator set is discussed.

**Large Electric Winders at the Randfontein Central Gold Mining Company, Limited, Chas. Miles and A. W. Stoker.** *S. African Instn. Engrs.—J.*, vol. 22, no. 6, Jan. 1924, pp. 77-93 and (discussion) 93-94, 22 figs. Details of mechanical and electrical portions; designed to hoist rock load of 10,000 lb. from depth of 3000 ft.; gear is operated by Ward-Leonard system with two main 2500-hp. motors.

#### HYDRAULIC ACCUMULATORS

**Construction and Characteristics.** Hydraulic Accumulators, H. S. Cattermole. *Mech. Wld.*, vol. 75, no. 1938, Feb. 22, 1924, pp. 113-114. Characteristics and constructional details.

**Design.** Hydraulic-Accumulator Installation at the Hartmann Textile Mill at Munster (Alsace) [L'installation d'accumulation d'énergie hydraulique des Manufactures Hartmann, à Munster (Haut-Rhin)]. *Génie Civil*, vol. 54, no. 2, Jan. 12, 1924, pp. 29-32, 6 figs. Whole plant includes low-pressure hydroelectric station with head of 15 m., and accumulating station with its sets of Sulzer centrifugal pumps and installations for utilization of high pressure.

#### HYDRAULIC MACHINERY

**Manufacture.** Fabricating Hydroelectric Units, H. R. Simonds. *Iron Trade Rev.*, vol. 74, no. 11, Mar. 13, 1924, pp. 732-735, 7 figs. Describes production of heavy castings and steel-plate sections for water-power machinery; new 70,000-hp. turbo-generator under construction by Allis-Chalmers Mfg. Co., Milwaukee.

#### HYDROELECTRIC TURBINES

**Checking Performance.** Checking the Operation of Hydro-Electric Units, Ralph Brown. *Power*, vol. 59, no. 10, Mar. 4, 1924, pp. 361-363, 4 figs. Detecting lost motion in operating-cylinder mechanism; checking output of unit; causes of reduced capacity; scheduling work when unit is taken out of service for repairs.

**Double-Runner Horizontal.** Turbines in Raanaasfoss Power Station, H. Thoresen. *Power*, vol. 59, no. 8, Feb. 19, 1924, pp. 278-281, 8 figs. Plan contains six double-runner horizontal-shaft 12,000-hp. turbines operating under head varying from 31 to 46 ft.; turbines are set in open flumes and two different European designs are used.

**Ice Formation, Prevention.** Preventing Ice Formation on Water Turbines, R. S. Hyatt. *Elec. World*, vol. 83, no. 8, Feb. 23, 1924, p. 386, 1 fig. Describes what is said to be effective means of heating turbine and preventing adherence of ice.

**Installation System.** Hallinger System of Installing Francis Turbines with Horizontal Shafts (Francisturbinen mit liegender Welle nach der Einbauweise von Hallinger), C. Reindl. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 6, Feb. 9, 1924, pp. 119-123, 14 figs. Describes four power plants and two designs for double twin turbines, which are located in machinery house under sheet-metal cover and have high-suction head-water level; arrangement requires little space, is easily installed and controlled.

#### HYDROELECTRIC DEVELOPMENTS

**Bavaria.** Water Power Developments in Bavaria. *World Power*, vol. 1, no. 2, Feb. 1924, pp. 80-84. Data on power developments of rivers in Bavaria; principal hydroelectric stations; distribution; financial aspect; railway electrification.

**Gold and Silver Mines, Ontario.** Hydro-Electric Development for Gold and Silver Mines of Northern Ontario, A. R. Webster. *Ontario Dept. Mines—Bul.*, no. 46, 1923, 23 pp., 20 figs. Describes installations of different power companies and gives amount of turbine capacity connected to generators owned by each, aggregating 64,490 hp.

**Liffey Project, Ireland.** The Liffey Power Scheme, R. N. Tweedy. *Elec. Rev.*, vol. 94, nos. 2411 and 2422, Feb. 15 and 22, 1924, pp. 244-245 and 285-287, 2 figs. Discusses scheme developed by Buchi, of Zurich, for Dublin Corp., which, it is claimed, may be accepted as basis of any scheme which involves complete control of Liffey River.

**Manitoba.** Great Falls Hydro-Electric Development of the Manitoba Power Company. *Power*, vol. 59, no. 12, Mar. 18, 1924, pp. 436-442, 12 figs. Complete project will consist of dam nearly mile long and installation of six 28,000-hp. turbines to operate under 56-ft. head, and each will require 5200 cu. ft.-sec. of water at full load; turbines are of propeller type and are largest capacity of this type ever constructed; special features are incorporated in design of draft tubes and scroll cases.

**San Francisco, Cal.** The Hetch Hetchy Water Supply and Power Project, C. W. Geiger. *Nat. Engr.*, vol. 28, no. 3, Mar. 1924, pp. 95-99, 4 figs. Will supply, when completed 400,000,000 gal. water daily to population of 4,000,000 people in San Francisco and other cities of metropolitan district, and will generate 200,000 hp.; describes O'Shaughnessy dam, and gives construction details of tunnel.

**Sicily.** A Sicilian Hydro-Electric Installation, J.

S. Barnes. *Elev. Rev.*, vol. 94, no. 2411, Feb. 8, 1924, pp. 219-221, 8 figs. Details of Belice hydroelectric scheme near Palermo; main storage reservoir has total capacity of 32,800,000 cu. m., of which 21,000,000 cu. m. may be drawn upon; dam is 133 ft. high, 866 ft. long and is dry-built of stone; pressure tunnel is 850 m. long; in engine room are four Pelton wheels each of 3500 b.h.p. connected directly with four 3-phase alternators.

#### HYDROELECTRIC PLANTS

**Austria.** The Teigitsch Hydroelectric Plant of the Styrian Water-Power & Electricity Corp., Austria (Das Teigitschkraftwerk der Steirischen Wasserkraft- und Elektrizitäts-A.G.), W. Hahn. *Elektrotechnik u. Maschinenbau*, vol. 42, no. 7, Feb. 17, 1924, pp. 89-94, 6 figs. Describes most important features of development, including dam, pressure conduits, reservoir, etc.; power-house equipment; includes three Francis spiral turbines to which generators are direct coupled.

**Vienna Builds Remarkable Power Project on Ybbs River.** O. Lemberger. *Eng. News-Rec.*, vol. 92, no. 12, Mar. 20, 1924, pp. 494-496, 5 figs. Collapsible weir dam; six miles of tunnels, one siphon and two aqueducts in conduit; unusual type of surge basin; penstock carried on slide bearings; electrical current is transmitted to Vienna over 110,000-volt transmission line 84 mi. long, partly simple 3-phase and partly double 3-phase on steel towers.

**France.** The Hydroelectric Plant of the Société Drac-Romanche at Pont-de-Claix on the Isère River (France) (L'usine hydro-électrique Drac-Romanche), P. Dufour. *Génie Civil*, vol. 84, no. 1, Jan. 5, 1924, pp. 1-8, 17 figs. Development includes dam, 750-m. open canal, 1450-m. reinforced-concrete pressure conduit, 14,000-h.p. power plant, equipped with six sets of turbo-alternators, and 750-m. tail race; study of connection of conduit with plant.

## I

#### ICE PLANTS

**Equipment.** Essentials of a Modern Ice Plant, C. T. Baker. *Refrigeration*, vol. 34, no. 2, Feb. 1924, pp. 43-47. What modern plant should consist of as regards machinery and equipment.

**Improvements.** Improvement in Ice Plants, R. C. Doremus. *Universal Engr.*, vol. 39, no. 2, Feb. 1924, pp. 23-28. Deals with water treatment, air treatment, ice-making system, harvesting equipment, condensers, water heating, electric drive, ice storage, etc. Paper read before N. A. P. R. E.

#### IMPACT TESTING

**Notched-Bar Tests.** On Notched-Bar Impact Tests, P. Fillunger. *Testing*, vol. 1, no. 1, Jan. 1924, pp. 23-32, 7 figs. Refers to formula for expressing energy to produce deformation in notched-bar impact specimen, and in order to show that equation is borne out by test results, investigation is made of several notched specimens of identical material but with different eccentricities.

#### INDEXES

**Decimal Classification.** The Nature, Purpose and Aim of Decimal Classification (Die Dezimalklassifikation. Ihr Wesen, Zweck und Ziel), E. Fontanellaz. *Glaser's Annalen*, vol. 94, no. 4, Feb. 15, 1924, pp. 44-46. Discusses DK (Dewey) classification system and its advantages for arranging and indexing technical publications.

#### INDUSTRIAL MANAGEMENT

**Planning.** Planning System in a Car Manufacturing Plant. *Ry. Rev.*, vol. 74, no. 9, Mar. 1, 1924, pp. 357-365, 15 figs. System of scheduling car-repair work in shops of Ralston Steel Car Co., Columbus, O.; exercises complete control of all manufacturing activities.

**Production Organization.** Production Organization. *Eng. Production*, vol. 7, no. 138, Mar. 1924, pp. 74-77. Reasons for organization and methods to be adopted; the ideal organization; laws governing manufacture; procedure in organizing a new factory.

**Service Methods.** Service, W. L. Wise. *Soc. Automotive Engrs.—Jl.*, vol. 14, no. 3, Mar. 1924, pp. 274-276 and 318. Applications of basic principles of service as developed by Nat. Cash Register Co., Dayton, O., are suggested for promulgation in automotive industry, following statement of methods employed in servicing cash registers.

**Stockroom Methods.** Extreme Variety Versus Standardization, J. H. Van Deventer. *Indus. Mgt.* (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 129-135, 13 figs. Stockroom methods and stock handling at plant of Gen. Elec. Co. at Schenectady.

#### INDUSTRIAL PLANTS

**Maintenance.** Modern Maintenance of Plant and Equipment, Wm. G. Ziegler. *Indus. Mgt.* (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 167-174, 9 figs. Carpentry, masonry, and machine repair.

#### INDUSTRIAL RELATIONS

**Employees' Publications.** Cooperation through Plant Publications, W. R. Winans. *Iron Age*, vol. 113, no. 9, Feb. 28, 1924, pp. 647-649. Basic principles to be considered in planning such publication, and outline of kind and proper handling of items that will keep it sold.

**Cooperative Program, B. & O. Shops.** New Cooperative Developments on the B. & O. *Ry. Age*, vol. 76, no. 10, Mar. 8, 1924, pp. 543-545. Program of cooperation between federated shop-craft unions and management started a year ago now extended to all shops on system; sharing gains; stabilization of employment; ideas from shopmen.

#### INSURANCE

**Group.** Group Insurance as a Factor in Industrial Relations, Wm. F. Chamberlin. *Indus. Mgt.* (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 149-150. Plans of group life insurance which have been found to be practical; formula in use by two or three well-known concerns.

#### INTERCHANGEABLE MANUFACTURE

**Maintaining Interchangeability.** Maintaining Interchangeability. *Am. Mach.*, vol. 60, no. 10, Mar. 6, 1924, pp. 349-350. Cases that would defeat interchangeability. (Abstract.) Address before Cleveland Eng. Soc.

#### INTERNAL-COMBUSTION ENGINES

**Internal Losses.** How Internal Losses in Power Plants Vary with Speed, P. M. Heldt. *Automotive Industries*, vol. 50, no. 10, Mar. 6, 1924, pp. 556-558. Determined by "motoring" engine with electric dynamometer; torque representing pumping loss is directly proportional to r.p.m. but frictional loss is independent of that factor.

**Lubrication.** Lubrication of Internal Combustion Engines, H. B. Warner. *Ariz. Min. Jl.*, vol. 7, no. 18, Feb. 15, 1924, pp. 21-22. Data regarding cycle of operations of internal-combustion engines.

**Temperature, Influence of Mixture on.** Strength of Mixture Has Marked Effect on Engine Temperature, C. B. Dicksee. *Automotive Industries*, vol. 50, no. 10, Mar. 6, 1924, pp. 566-571, 7 figs. Influence not always realized sufficiently; recent researches show relationship; experiments indicate detonation is function of rate of flame propagation.

[See also AIRPLANE ENGINES; AUTOMOBILE ENGINES; DIESEL ENGINES; MOTOR TRUCKS, ENGINES; OIL ENGINES.]

#### IRON CASTINGS

**Defective.** Defective Castings: Causes and Remedies. *Foundry Trade Jl.*, vol. 29, no. 390, Feb. 7, 1924, pp. 125-128, 10 figs. Causes and remedies of different defects; eccentric cores; venting plates and gutters; small high-speed flywheels.

#### IRON, PIG

**Charcoal, Manufacture of.** The Mysore Distillation and Iron Works Design and Construction, J. P. Carmody. *Mysore Engrs' Assn. Bul.*, vol. 1, no. 1, July-Sept. 1923, pp. 23-72. Description of works located at Bhadravati on Bhadra river, British India, including saw-mill, carbonizing, distillation, ore-crushing, and blast-furnace plants, power house and electrical equipment, and boiler house. Crude methyl alcohol, acetate of lime, tar and light oils are recovered from pyroigneous acid.

## L

#### LATHES

**Turret, Use for Chucking Work.** The Ungearred Capstan Lathe as a Chucking Machine, E. W. Field. *British Machine Tool Eng.*, vol. 3, no. 25, Jan.-Feb. 1924, pp. 3-7 and 28, 9 figs. Gives examples showing large range of chucking work small plain-head turret lathe will cover.

**Turret vs. Lathe Work.** Lathe and Turret Work Compared, J. Horner. *Mech. World*, vol. 75, nos. 1932 and 1937, Jan. 11 and Feb. 15, 1924, pp. 18-19 and 94, 10 figs. Describes procedure.

#### LIQUIDS

**Fluidity and Temperature, Relation of.** A Relation between the Fluidity and the Temperature of Liquids, H. J. M. Creighton. *Nova Scotian Inst. Sci.—Proc. & Trans.*, vol. 15, Pt. 3-4, Nov. 1923, pp. 165-168. Calculations.

#### LOCOMOTIVE BOILERS

**Dome Flanging.** Flanging Locomotive Boiler Domes in One Piece. *Boiler Maker*, vol. 24, no. 2, Feb. 1924, pp. 31-36, 4 figs. Practice of Am. Locomotive Co., Schenectady, N. Y.; flanging throat sheets.

**Performance.** Locomotive Boiler Performance, E. C. Poultnery. *Engineer*, vol. 137, nos. 3556 and 3557, Feb. 22 and 29, 1924, pp. 192-195 and 218-221, 15 figs. Information on performance of locomotive boilers differing in proportion of their related parts when operating at various rates of power output, based upon tests made by Pennsylvania System on locomotive testing plant at Altoona, Pa.

#### LOCOMOTIVES

**Adhesion and Rack.** A Modern Rack Locomotive. *Ry. Gaz.*, vol. 40, no. 6, Feb. 8, 1924, p. 174, 1 fig. Principal data of recent type of 4-cylinder, 2-8-2 type combined rack and adhesion locomotive, built for German State Ry. for operation on Abt system.

**British.** British Locomotives in 1923, J. F. Gairns. *Int. Ry. Congress Assn.—Bull.*, vol. 6, no. 2, Feb. 1924, pp. 121-137, 8 figs. Designs and work.

**Compound vs. Simple.** Compound vs. Simple Locomotives in France, M. Vallantine. *Ry. Age*, vol. 76, no. 8, Feb. 23, 1924, pp. 461-462. Tests of Pacific locomotives in express service on P. L. & M. and Paris-Orleans show economy of compounds.

**Decapod.** Decapod Type Locomotive for G. M. & N. R. R. *Ry. Rev.*, vol. 74, no. 8, Feb. 23, 1924, pp. 317-320, 4 figs. Dimensions and principal data of 2-10-0 type locomotives of Gulf Mobile & Northern R. R. for heavy freight service; 215-lb. boiler pressure; 60,000-lb. tractive force. See also *Ry. & Locomotive Eng.*, vol. 37, no. 2, Feb. 1924, pp. 35-36, 1 fig.; and *Railroad Herald*, vol. 28, no. 3, Feb. 1924, pp. 16-17, 1 fig.

**Design.** Locomotive Design. *Ry. Jl.*, vol. 30, no. 3, Mar. 1924, pp. 18-19, 45 figs. pp. 19-31. Deals with starting capacity, hauling capacity and general economy in operation. Illustrations of American locomotive types.

**The Locomotive of To-Day.** J. Partington. *New England Railroad Club*, Feb. 12, 1924, pp. 245-257 and (discussion) 257-273. Discusses ways in which design must be definitely made to fit physical limitations of roadbed, bridges, tunnels, roundhouses, etc., and important connection between design and maintenance facilities especially as it applies to proper maintenance of appliances and materials now coming into general use. Review of three-cylinder locomotive; description of 3-cylinder locomotive No. 5000 of Lehigh Valley R. R. and results of test made in Dec. 1923.

**Diesel-Compressed Air.** Diesel-Compressed Air Locomotive. *Times Trade & Eng. Supp.*, vol. 13, no. 295, Mar. 1, 1924, p. 615. Invention consists in applying compressed air by means of Diesel engine as motive power for railway traction; results of trials on Italian railways.

**Evolution.** Railway Developments and the Evolution of High-Speed Locomotives (Le développement des chemins de fer et l'évolution de la locomotive à grande vitesse), M. Demoulin. *Génie Civil*, vol. 84, nos. 3 and 4, Jan. 19 and 26, 1924, pp. 60-64 and 85-89, 14 figs. Describes engine types built between years of 1850 and 1865, showing that many reputedly modern innovations are merely re-inventions, success of which was due to certain improvements in details or other factors.

**4-8-2 Type.** Southern Pacific 4-8-2 Type Locomotives. *Ry. Mech. Engr.*, vol. 98, no. 3, Mar. 1924, pp. 141-146, 10 figs. Description of locomotives designed to haul trains of 12 passenger cars on 2 per cent grades and run 815 miles (between Los Angeles, Cal., and El Paso, Tex.); rated tractive force, 85 per cent, 57,510 lb., and with booster, 67,660 lb.

**Fuel Economy.** Suggestions on Locomotive Fuel Economy, D. L. Franciscus. *Ry. Rev.*, vol. 74, no. 7, Feb. 16, 1924, pp. 286-288. Abstract of prize-winning paper in Int. Ry. Fuel Assn. contest.

**Garratt Type.** Garratt Locomotive in India and South Africa. *Ry. Rev.*, vol. 74, no. 10, Mar. 8, 1924, pp. 447-449, 3 figs. Describes locomotives to be placed in service on Burma and New Cape Central railways, former having 2-8-0—0-8-2 wheel arrangement, and latter 2-6-2—2-6-2 arrangement.

**Lubrication.** Force Feed Lubrication on Locomotives, A. H. Woodward. *Ry. Mech. Engr.*, vol. 93, no. 3, Mar. 1924, pp. 151-152, 4 figs. Describes an original method by which oil is automatically supplied to the various bearing surfaces.

**Mikado.** Mikado Type Locomotives, Canadian National Railways. *Can. Ry. & Mar. World*, no. 312, Feb. 1924, pp. 53-55, 4 figs. Belpaire boiler; 27 by 30-in. cylinder; working pressure 185 lb.; maximum tractive power 54,600 lb. See also *Boiler Maker*, vol. 24, no. 2, Feb. 1924, pp. 45-47, 2 figs.

**Two Light Mikado Locomotives Built at Lima.** *Ry. Age*, vol. 76, no. 9, Mar. 1, 1924, pp. 505-506, 2 figs. Designed for local conditions but approximately same capacity as U. S. R. A. light Mikados.

**Mountain Type.** Lehigh Valley Three-Cylinder Locomotive Tests. *Ry. Age*, vol. 76, no. 15, Mar. 15, 1924, pp. 755-757, 13 figs. 4-8-2 type built by Am. Locomotive Co. handles heavy tonnage with low fuel consumption; results of tests; performance on grades.

**Rebuilt.** Modernized Power From Reconstructed Locomotives. *Ry. Rev.*, vol. 75, no. 9, Mar. 1, 1924, pp. 367-372, 9 figs. Account of overhauling of several classes of engines by Chicago Indianapolis & Louisville Ry. in its shops at La Fayette, Ind. illustrating methods by which Monon has practically made modern locomotives out of old, as engines pass through shops for repairs.

**Steam-Turbine.** Turbo-Condensing Locomotives (Dampflokomotiven mit Kondensation). *Glaser's Annalen*, vol. 94, no. 3, Feb. 1, 1924, pp. 25-31, 4 figs. Discussion by R. P. Wagner and others of paper by R. Lorenz, in which former claims that use of steam condensation in piston locomotives effects little or no improvement with regard to performance or economy.

**10-Wheel.** Maine Central Purchases Ten-Wheel Locomotives. *Ry. Age*, vol. 76, no. 10, Mar. 8, 1924, pp. 555-556, 1 fig. Modern design of medium capacity with 63-in. drivers suitable for local passenger or freight traffic.

**Three-Cylinder.** Three Cylinder Superheated Steam Express Locomotive of the German State Railways. *Ry. & Locomotive Eng.*, vol. 37, no. 3, Mar. 1924, pp. 75-78, 3 figs. German argument against use of two-cylinder compound locomotive; describes type of three-cylinder locomotive first built at Borsig shops in Tegel in 1922 and now being used somewhat extensively on German railways.

**2-8-2.** New 3-Cylinder, 2-8-2 Type Locomotive, German State Railways. *Ry. Gaz.*, vol. 40, no. 5, Feb. 1, 1924, p. 143, 1 fig. Principal dimensions and data of locomotives designed for working express passenger and heavy freight traffic; working pressure 200 lb. per sq. in.

**New 2-8-2 Type Locomotives for the Sudan Government Railways.** *Ry. Gaz.*, vol. 40, no. 6, Feb. 8, 1924, p. 173, 1 fig. Principal data of locomotives being introduced for working on Kassala line extension; for 3-ft. 6-in. gage; tractive force at 85-per cent boiler pressure, 26,000 lb.

**2-10-2.** 2-10-2 Type Replace Mallets on Great Northern. *Ry. Age*, vol. 76, no. 8, Feb. 23, 1924, pp. 459-460, 1 fig. 3000 tons handled over 1.8-per cent grade by locomotives of 87,130-lb. tractive force; built by Baldwin Locomotive Works.

**Types.** Some Recent Notable Locomotives, J. Partington. *Can. Ry. Club—Proc.*, vol. 23, no. 1, Jan. 1924, pp. 21-32 and (discussion) 32-39, 2 figs.

- Goulds Mfg. Co.
- Ingersoll-Rand Co.
- Lammert & Mann Co.
- Nordberg Mfg. Co.
- Wheeler, C. H. Mfg. Co.
- Wheeler Cond. & Engrg. Co.
- Worthington Pump & Machinery Corp'n

Characteristics and performances of several recent designs of locomotive. See also Ry. & Locomotive Eng., vol. 37, no. 2, Feb. 1924, pp. 39-41, 1 fig.

#### LUBRICATING OILS

**Investigating Method.** A Novel, Simple and Universal Method for the Investigation of Lubricating Oils and Bearing Alloys, R. von Dallwitz-Wegner. Testing, vol. 1, no. 1, Jan. 1924, pp. 58-71, 8 figs. New method is said to be free from all factors of uncertainty.

**Reclaiming Process.** A New Oil Reclaiming Process, Eng. Production, vol. 7, no. 138, Mar. 1924, p. 88, 2 figs. Describes method invented by T. D. Richards, an Australian; deals with all classes and grades of dirty lubricating oils. See also Elec. Times, vol. 65, no. 1689, Feb. 28, 1924, p. 251, 1 fig.

**Viscosity.** Variation of Viscosity of Lubricating Oils with Temperature (Zur Temperaturabhängigkeit der Viskosität), F. König. Zeit. für angewandte Chemie, vol. 37, no. 1, Jan. 3, 1924, pp. 8-10, 1 fig. Discusses equation given by Vogel in previous issue of same journal as expressing variation of viscosity with temperature and reaches conclusion that constants employed in it cannot be determined with sufficient accuracy to render them of any value as criteria in judging commercial oils; explains how these difficulties can be overcome.

#### LUBRICATION

**Lubricators.** Methods of Applying Lubricating Oils (Méthodes d'application des lubrifiants liquides), J. Lévy. Technique Moderne, vol. 16, no. 3, Feb. 1, 1924, pp. 69-75, 14 figs. General principles and modern apparatus; describes different types of lubricators, including manual, semi-automatic, automatic and mechanical; accessory and special devices.

#### LUMBER

**Standardization.** Engineering and Industrial Standardization, Mech. Eng., vol. 46, no. 3, Mar. 1924, pp. 167-169. Simplified practice recommendations on lumber.

## M

#### MACHINE DESIGN

**Self-Centering Devices.** Self-Centering Devices, A. Perham. Machy. (Lond.), vol. 23, no. 593, Feb. 7, 1924, pp. 625-627, 1 fig. Term self-centering is used to describe devices in which displacement, and recovery can be effected in each direction of movement; describes some of more usual and elementary forms of self-centering mechanism, and useful forms that are less generally known.

#### MACHINE SHOPS

**Steel-Frame One-Story.** Details of a Modern Steel Frame One-Story Shop. Eng. News-Rec., vol. 92, no. 11, Mar. 13, 1924, pp. 456-459, 7 figs. New plant of Sullivan Machy. Co., Michigan City, Ind., has specially fitted sawtooth roof and crane runways carried by main columns and jack columns; transfer table economizes yard space.

#### MACHINE-TOOL INDUSTRY

**Great Britain.** Survey of British Machine Tool Industry, Johnstone-Taylor. Iron Age, vol. 113, no. 11, Mar. 13, 1924, pp. 799-800. Builders concentrate on either light or heavy tools; changes in last ten years; surplus of automatics; status of other tools.

#### MACHINE TOOLS

**Electrically Driven.** Regio Machine Tools (Regio-Werkzeugmaschinen), O. Pollak. Werkstattstechnik, vol. 18, nos. 2 and 3, Jan. 15 and Feb. 1, 1924, pp. 21-28 and 53-57, 27 figs. Describes electric machine-tool drives of German Gen. Elec. Co. which form integral but interchangeable part of machine, so that such a machine works as whole unit in same way as turbo-generator, electric winding engine, etc.; numerous examples are described and illustrated.

**German.** New Machines and Tools Exhibited at the Leipzig Fair (Neue Maschinen und Werkzeuge). Werkstattstechnik, vol. 18, nos. 4 and 5, Feb. 15 and Mar. 1, 1924, pp. 98-110 and 141-156, 104 figs. Feb. 15: Describes method of accurate production of dividing wheels for gear-cutting machines; gear-cutting machines; automatic gear-cutting lathes; planing machines; automatic and turret lathes; saws; microscope for workshop measurements; etc. Mar. 1: Device for cutting bevel gears; Lauf-Thoma gears for machine tools; grinding machines; shaping and slotting machines; milling machines; woodworking machines; etc.

**Speeds and Feeds.** Tool Engineering, A. A. Dowd and F. W. Curtis. Am. Mach., vol. 60, no. 9, Feb. 28, 1924, pp. 315-318. Speeds and feeds of machine tools; definition of cutting speed; relation between speed and feed; points in design affected by speeds and feeds.

**Standard Data Sheets.** Standard Data Sheets for Machine Tool Builders and Users, A. L. Evans. Am. Mach., vol. 60, no. 11, Mar. 13, 1924, pp. 381-386, 3 figs. Standard data sheets devised by author in order to simplify work of planning, routing, designing, equipping tools, making time studies, changing factory layout and similar tasks.

#### MALLEABLE IRON

**Iron-Carbon Eutectoid.** Identification of the Thermal Effect of the Iron-Carbon Eutectoid and Extrapolation of the Heating and Cooling Curve Values to Zero Rates, A. Hayes, H. E. Flanders and E. E. Moore. Am. Soc. Steel Treating—Trans., vol. 5, no. 2, Feb. 1924, pp. 183-194, 6 figs. Application of thermal-analysis methods have been applied to location of iron-carbon eutectoid in malleable iron containing 0.95-per

cent silicon; method places this point on iron-carbon diagram at temperature of 771 deg. cent.

#### MANOMETERS

**High Pressures, Measurement of.** Measurement of High Pressures, F. H. Newman. World Power, vol. 1, no. 2, Feb. 1924, pp. 85-90, 7 figs. Compressed-gas type of manometer; elastic-membrane type of gage; optical lever and piezoelectrical manometer.

#### MATERIALS HANDLING

**Accidents.** A Study of Fatal Accidents in Material Handling, D. S. Beyer. Nat. Safety News, vol. 9, no. 3, Mar. 1924, pp. 27-28. Statistical data; and particulars of 16 fatal accidents reported to Liberty Mutual Insurance Co., Boston, Mass. Paper read before joint mtg. of Eng. Section of Nat. Safety Council and Am. Soc. Safety Engrs.

**Equipment for.** Trends in Handling Materials, F. E. Gooding. Indus. Engr., vol. 82, no. 2, Feb. 1924, pp. 81-89, 12 figs. Reviews present tendencies and practices in industrial plants in handling material by conveyors, industrial trucks, tractors, hoists, and similar equipment.

#### MEASURING INSTRUMENTS

**Optical.** New Optical Measuring Methods for Tool and Machine Construction (Neue optische Messverfahren für den Werkzeug- und Maschinenbau), A. Steinle. Maschinenbau, vol. 3, no. 9, Feb. 14, 1924, pp. 244-249, 15 figs. New measuring instruments and favorable results obtained with them.

#### METALS

**Brittleness.** Brittleness, W. R. Barclay. Metal Industry (Lond.), vol. 24, no. 7, Feb. 15, 1924, pp. 151-162 and 168. Causes and types of brittleness; its relation to toughness, ductility, plasticity, and crystal structure. Paper read before Birmingham Met. Soc.

**Coefficients of Expansion.** Determination of the Thermal Coefficients of Expansion of Some Commercial Metals and Alloys, J. N. Friend and R. H. Vallance. Inst. Metals—advance paper, no. 5, for meeting Mar. 12-13, 1924, 4 pp. Describes apparatus used and results obtained.

**Fatigue.** The Investigation of a Fatigue Failure of Brass Tubes in a Feed-Water Heater, with a Consideration of the Nature of "Fatigue," W. E. W. Millington and F. C. Thompson. Inst. Metals—advance paper, no. 11, for meeting Mar. 12-13, 1924, 23 pp., 18 figs. Description of failure; effects of mechanical deformation on close-packed cubic crystal compares new theory of authors—that straight markings are cause of embrittlement which lead to fracture—with actually observed facts.

#### MILLING

**Brakes, Drums and Spiders.** Machining Sheldon Brakes, Drums and Spiders, F. H. Colvin. Am. Mach., vol. 60, no. 11, Mar. 13, 1924, pp. 387-389, 9 figs. Special fixtures and tools devised for machining work of odd shape; fixtures are shown in considerable detail so their construction can be more readily understood.

**Grooves.** The Milling of Grooves (Das Fräsen von Nuten). Praktischer Maschinen-Konstrukteur, vol. 57, no. 5, Feb. 5, 1924, pp. 39-42, 4 figs. Describes different methods, tools and machines employed, and shows how running time of a Loeve milling machine can be calculated with aid of alignment charts.

#### MOLDING MACHINES

**Development.** The Molding Machine, R. E. Search. Metal Industry (N. Y.), vol. 22, no. 2, Feb. 1924, pp. 56-58, 9 figs. Early history and development. Simple forms of foundry machines.

#### MOTOR BUSES

**Gear-Shifting Mechanism.** Novel Gear Shifting Mechanism Chief Feature of German Bus, B. R. Dierfeld. Automotive Industries, vol. 50, no. 10, Mar. 6, 1924, pp. 575-576, 5 figs. New Kastner gate change incorporates original design; special method used for locking shifter bars has merit of compactness and simplicity; device evolved to prevent swaying of rear end; front-axle steering pivot operates constantly in bath of oil; chassis is brought out by Mannesmann-Mulag Co., Aix-la-Chapelle.

**Reo.** Six-Cylinder Engine and Four-Wheel Brakes Feature New Reo Bus. Automotive Industries, vol. 50, no. 9, Feb. 28, 1924, pp. 499-501, 4 figs. Power unit and gearset mounted in sub-frame in similar fashion to passenger car of same make; body seats 21.

**Self-Charging.** Self-Charging Principle Applied on 25-Passenger Bus. Bus Transportation, vol. 3, no. 3, Mar. 1924, pp. 109-112, 7 figs. Details of new bus in operation on 96th St. line, New York City; storage battery acts as a power reservoir; keeps engine-generator set working at constant output; combination permits use of a 20-hp. gasoline engine.

**Specifications.** American Gasoline Motor Bus Specifications. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 420-421. Table of statistics.

#### MOTOR-TRUCK TRANSPORTATION

**Coordination of Railroad and.** The Coordination of Railroad and Motor-Truck Transportation, Rob. C. Wright. Soc. Automotive Engrs.—Jl., vol. 14, no. 3, Mar. 1924, pp. 302-304. As result of study, Pa. R. R. system has become convinced that motor truck can cooperate with steam railroad in three lines of activity: (1) in substituting motor trucks for rail transportation for handling short-haul less-than-carload traffic (2) in motorizing terminals and (3) in door-to-door delivery service; advantages of motor truck in handling short-haul less-than-carload traffic; conclusions drawn.

#### MOTOR TRUCKS

**Auxiliaries.** Trucks, Truck Bodies, and Transportation, M. W. Potts. Indus. Mgt. (N. Y.), vol. 67, no. 3, Mar. 1924, pp. 151-160, 12 figs. Auxiliaries that make motor truck important link in national transportation system of United States.

**Engines.** A Solid Fuel Engine. Motor Transport (Lond.), vol. 38, no. 991, Feb. 25, 1924, pp. 219-220, 5 figs. Engine based on principle of injection of compressed air into solid fuel dust when in a glowing state, invented by A. Schnuerle; application to 4- and 2-cycle principle; applicable for truck or tractor work.

**Glasgow Show.** The Scottish Show Reviewed. Motor Transportation (Lond.), vol. 38, no. 988, Feb. 4, 1924, pp. 137-140, 17 figs. Notes on representative display of British and imported heavy vehicles, including light vans.

**One-Truck.** England's Largest Car Manufacturer Introduces One-Ton Truck. Automotive Industries, vol. 50, no. 9, Feb. 28, 1924, pp. 522-523, 1 fig. First British product in this class is expected to cut into practical monopoly of Ford; 3-by-4-in. engine and 122-in. wheelbase; constructed by Morris Motors, Ltd.

**Producer-Gas-Driven.** The New Renault Producer, W. F. Bradley. Motor Transport (Lond.), vol. 38, no. 988, Feb. 4, 1924, pp. 127-129, 8 figs. Designed to run on wood or charcoal; claimed to show cost economy of 80 per cent; comprises fire box, aspiration chamber and fuel tank, and is a cylindrical chamber 4 ft. 6 in. in height, with a diameter of 2 ft., bolted to left-hand frame member by side of driver's cab.

**Saurer.** Saurer 6 1/2-Tonner Placed on American Market. Motor Transport (N. Y.), vol. 29, no. 11, Jan. 1, 1924, pp. 376-377, 2 figs. Engine brake, ball bearings on crankshaft and camshaft, cast-iron brake shoes in place of lining, and bevel drive are features.

**Specifications and Design.** Recent Trends in Truck Design. Automotive Industries, vol. 50, no. 8, Feb. 21, 1924, pp. 424-439. American gasoline-truck specifications; British and Continental European truck-chassis specifications.

**Two-Ton.** London Gen. Omnibus Co. Subsidiary Adds Two-Ton Truck to Present Line, M. W. Bourdon. Automotive Industries, vol. 50, no. 10, Mar. 6, 1924, pp. 550-553, 8 figs. Associated Equipment Co. announces new vehicle designed to operate with low maintenance costs; engine has barrel-type crankcase, inserted cylinder sleeves and ball-bearing crankshaft; first English product of this class to employ battery ignition.

#### MOTORCYCLES

**Horizontal-Frame.** The Ner-a-car. Automobile Engr., vol. 14, no. 186, Feb. 1924, pp. 32-38, 12 figs. Describes motorcycle of unconventional design; main departure is use of horizontal frame in place of usual vertical diamond frame which has considerably simplified mounting for engine, transmission and other accessories; two-stroke engine is employed, fitted with combined flywheel magneto.

## O

#### OIL ENGINES

**Light-Oil.** High-Speed Petrol and Paraffin Engines, J. Okill. Gas & Oil Power, vol. 19, nos. 220 and 221, Jan. 3 and Feb. 7, 1924, pp. 73-74 and 89-90 and 96, 3 figs. Deals with features and management of the lighter fuel types of oil engine.

**Scott-Still.** The Type of Still Engine Required for Marine Service with Special Reference to the Scott-Still Engine, W. J. Still. North-East Coast Instn. Engrs. & Shipbldr.—advance paper, no. 2698S, for meeting, Feb. 15, 1924, 25 pp., 17 figs. Discusses use of high-combustion m.e.p.'s and consequent production of excessive heat stresses in cylinder walls; fuel-injection troubles; insufficient ignition temperatures; water-circulation troubles; want of cylinder lubrication and wear of liners; bearing troubles.

#### OIL FUELS

**Bergius Production Process.** The Bergius Process (Le Procédé Bergius), P. Erculisse, F. Ranwez and P. Bruylants. Chaleur & Industrie, vol. 4, no. 44, Dec. 1923, pp. 931-943, 13 figs. Study of process which consists essentially in effecting a cracking under high hydrogen pressure; results of tests and practical experiences.

#### OXY-ACETYLENE WELDING

**Brass.** The Oxy-Acetylene Torch on Brass Work, D. Baxter. Am. Blacksmith & Motor Shop, vol. 24, no. 2, Feb. 1924, pp. 17-18 and 25, 5 figs. Peculiarities in action of brass under heat that must be considered when applying torch flame, and just how to work brass with gas torch.

**Iron Conduit Yokes.** Welding Large Iron Castings with the Oxyacetylene Torch. Elec. Ry. Jl., vol. 63, no. 7, Feb. 16, 1924, pp. 245-246, 3 figs. The successful welding of conduit yokes by New York & Harlem R. R.; castings are heated with gas while they are being welded and afterward cooled slowly in annealing ovens; cost of reclaimed yoke one-sixth price of new one.

**Machine.** Oxy-Acetylene Machine Welding, F. E. Rogers. Acetylene Jl., vol. 25, no. 8, Feb. 1924, pp. 377-380, 8 figs. Application of automatic machines and single and multi-flame welding torches to production work.

**Mines.** Applications of Oxy-Acetylene Welding and Cutting in the Mining Industry, H. Ulmer. Am. Welding Soc.—Jl., vol. 3, no. 1, Jan. 1924, pp. 2-13. Describes the various applications and shows value of this process in mining industry.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

A. A. Dowd and F. W. Curtis. *Am. Mach.*, vol. 60, no. 10, Mar. 6, 1924, pp. 365-368, 4 figs. Pattern work and its relation to designer; importance of shape of pattern; methods of molding; construction of flanged patterns.

#### PIPE

**Joints.** The Victaulic System of Pipe Joining. *Engineering*, vol. 117, no. 3033, Feb. 15, 1924, pp. 205-206, 4 figs. Describes modifications in Victaulic joint since first put on market and its advantageous features, among which is its flexibility.

**Thermal Efficiency and Pipe Diameter.** Thermal Efficiency and Pipe Diameter (Wärmeleistung und Rohrdurchmesser), H. Fichtl. *Gesundheits-Ingenieur*, vol. 47, no. 4, Jan. 26, 1924, pp. 25-26, 3 figs. Calculation of hourly heat abstraction from pipe from its diameter.

#### PIPE, CAST-IRON

**Census of Manufactures.** Cast-Iron Pipe. U. S. Bur. Census, 1923, 7 pp. Census of manufactures, covering operations of manufacturing establishments during 1921.

#### PIPE COVERINGS

**Steam-Pipe.** Radiation Losses. *Eng. & Boiler House Rev.*, vol. 37, no. 8, Mar. 1924, pp. 286-287, 2 figs. Saving to be effected by suitable and efficient steam pipe covering.

#### PIPE, STEEL

**Failure.** High-Head Penstock Failure Found Due to Bad Steel. *Power*, vol. 50, no. 10, Mar. 4, 1924, pp. 373-374, 1 fig. Section of 30-in. pipe for 1909-ft. head ruptures through laminated end of plate; welds not affected.

#### PLATES

**Cast-Iron.** Production of. Making Large Cast-Iron Plates, F. C. Edwards. *Metal Industry (Lond.)*, vol. 24, no. 7, Feb. 15, 1924, pp. 153-154, 2 figs. Describes practice successfully followed at a foundry where large quantities are made.

#### POLISHING

**Tumbling and Burnishing.** Tumbling and Burnishing, B. G. Krause. *Machy. (N. Y.)*, vol. 30, no. 7, Mar. 1924, pp. 501-502, 1 fig. Types of tumbling barrels; tumbling media or materials; ball-burnishing practice; plating and janniping; examples of work suitable for tumbling and burnishing.

#### POWER GENERATION

**Economical Operation.** Increasing Efficiencies in Power Generation, R. W. Angus. *Power House*, vol. 17, no. 4, Feb. 20, 1924, pp. 22-24, 3 figs. Improvements in economical operation of power by steam; modern trend to be toward higher pressures with less superheat, and multi-stage feedwater heating processes.

#### PRESSWORK

**Drawing-Press Tools.** The Calculation of Draw-Press Tools (Die Berechnung von Ziehwerkzeugen), W. Sellin. *Maschinenbau*, vol. 3, no. 9, Feb. 14, 1924, pp. 229-235, 10 figs. Discusses most accurate method of determining diameter of blank; calculation of punch diameter; development of proper relation between diameter of shell and drawing depth.

#### PULVERIZED COAL

**Boiler Firing with.** An Investigation of Powdered Coal As Fuel for Power-Plant Boilers, H. Kreisinger, J. Blizard, C. E. Augustine and B. J. Cross. U. S. Bur. Mines, Bul. 223, 1923, 90 pp., 48 figs. Results of 36 tests made on a 468-hp. Edge Moor boiler fired with pulverized coal at Oneida St. Station of Milwaukee Elec. Ry. & Light Co., Milwaukee, Wis., to determine what overall boiler efficiency could be obtained with pulverized coal under various conditions of furnace operation and with coal of different fineness and moisture content.

**Combustion.** The Combustion of Pulverized Coal, E. Audibert. *Fuel*, vol. 3, no. 13, Feb. 1924, pp. 56-62, 4 figs. Account of results obtained in research carried out by Le Comité Centrale des Houillères de France; experimental arrangements; duration of combustion; inflammation of dust clouds; combustion chamber.

The Combustion Process in Pulverized-Coal Furnaces (Der Verbrennungsvorgang in der Kohlenstaubfeuerung), Wm. Nusselt. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 6, Feb. 9, 1924, pp. 124-128. Points out that process of combustion falls in two parts both of which are explained; by use of law of heat transmission and diffusion, formulas are obtained for both parts of process, so that time of ignition and duration of combustion of blown-in fuel can be calculated.

**Velocity of Particles Falling in Air.** The Terminal Velocity of Particles of Powdered Coal Falling in Air or Other Viscous Fluid, J. Blizard. *Franklin Inst.*, vol. 197, no. 2, Feb. 1924, pp. 199-208, 1 fig. Shows how velocity is affected by size and density of particle and density and viscosity of gaseous medium in which it falls. Terminal velocity acquired by a particle of powdered coal falling in combustion chamber of a furnace is important factor determining rate at which particle burns, for the higher the velocity the more rapidly will a fresh supply of oxygen be brought to its surface. Conclusions reached applicable to estimation of velocity with which small particles other than coal fall in fluids.

#### PUMPING PLANTS

**Million-Gallon, for Railway Service.** Southern Pacific Completes Million Gallon Pumping Plant. *Ry. Eng. & Maintenance*, vol. 20, no. 3, Mar. 1924, pp. 105-107, 5 figs. Large air-lift system at El Paso proves big improvement over prior arrangement.

#### PUMPS

**Gasoline.** The "Shell" Kerbside Petrol Pump. *Engineering*, vol. 117, no. 3036, Mar. 7, 1924, pp. 301-

304, 10 figs. Gasoline is raised from underground tank by hand-operated, semi-rotary pump and delivered into one or other of two measuring vessels, or containers, through four-way plug cock.

## R

#### RAILS

**Corrugation.** Rail Corrugation Experience. *Elec. Ry. J.*, vol. 63, no. 7, Feb. 16, 1924, pp. 255-260, 7 figs. Survey of railways in various parts of United States, giving new data as to extent of this trouble; practices followed in removing and cost, and comments as to causes.

**Joint Welding.** Investigation of Seam Welded Rail Joints, R. B. Fehr. *Am. Welding Soc.—J.*, vol. 3, no. 1, Jan. 1924, pp. 28-60, 17 figs. Results of investigation along following lines: Functions of seam-welded rail joints and stresses to which they are subjected; improvements in joint structure and welding processes; development of practical method for making accelerated tests on seam-welded joints; and comparative tests on seam-welded joints in which variations have been made in either mechanical structure or welding process.

**Progress Report No. 2 of Committee on Welded Rail Joints.** *Am. Welding Soc.—J.*, vol. 3, no. 2, Feb. 1924, pp. 48-88, 28 figs. Report of committee organized by Am. Elec. Ry. Assn. and Am. Bur. of Welding, to investigate various types of welded rail joints in commercial use. Summary of tests.

**Joints.** A Non-Deflecting Rail Joint. *Indian Eng.*, vol. 75, nos. 1 and 2, Jan. 5 and 12, 1924, pp. 10-11 and 24-25, 10 figs. on supp. plates. Details of joint proposed by Bradford Leslie.

**Neafie Improved Rail Joint.** *Ry. Rev.*, vol. 74, no. 11, Mar. 15, 1924, pp. 524-525, 4 figs. Describes joint designed, by A. J. Neafie, with a heavy base plate which is supported by two ties.

**Wheel Thrust on.** Otheograph Records of Steam and Electric Locomotives, P. M. Gillilan. *Gen. Elec. Rev.*, vol. 27, no. 3, Mar. 1924, pp. 179-181, 7 figs. Notes on a device for recording thrust on rails by each separate wheel of a locomotive or motor car; shows by a graphic record amplitude and characteristic of both vertical and transverse thrust of all wheels on each tie. Describes records made.

**Otheographic Records of Wheel Effects on Rails.** *Eng. News-Rec.*, vol. 92, no. 11, Mar. 13, 1924, pp. 441-442, 5 figs. Tests of electric and steam locomotives; charts show load and lateral thrust imposed by each passing wheel.

#### RAILWAY ELECTRIFICATION

**S. African Ry.** The Electrification of the South African Railways, W. Hoy. *S. African Eng.*, vol. 35, no. 1, Jan. 1924, pp. 3-5, 6 figs. Main features of conversion from steam to electric operation of portion of line from Glencoe Junction to Pietermaritzburg, bringing progress of work up to November.

#### RAILWAY MAINTENANCE

**Expense Analysis.** Analysis of Equipment Maintenance Expenses, J. L. White. *Ry. Age*, vol. 76, no. 9, Mar. 1, 1924, pp. 507-510. Reviews information available in accounts and explains methods for its use.

#### RAILWAY MANAGEMENT

**Store-Department Methods.** Functions of the Store Department, U. K. Hall. *New England Railroad Club*, Jan. 8, 1924, pp. 214-225 and (discussion) 225-240. Discusses functions, including supply-train service, shop delivery, reclamation, etc.

#### RAILWAY MOTOR CARS

**Gasoline.** Two-Unit Motor Train for Mississippi Central. *Ry. Elec. Engr.*, vol. 15, no. 2, Feb. 1924, pp. 43-45, 3 figs. Description of two-car gasoline-driven train, built by Four Wheel Drive Auto Co., Clintonville, Wis., which will operate from Hattiesburg to Beaumont, Miss.; motor unit provides space for baggage and seats for 12 passengers, and trailer seats 34 passengers; electric lighting circuits patterned after standard automobile practice.

**German.** Railway Motor Cars. *Eng. Progress*, vol. 5, no. 1, Jan. 1924, pp. 18-20, 4 figs. Cars designed by German Gen. Elec. Co. (AEG) in conjunction with Nat. Automobile Co. (NAG), Berlin, having 6-cylinder, 4-cycle engine with output of 50 to 75 hp. at 950 r.p.m.; advantages claimed for cars.

**Steam.** The "Sentinel-Cammell" Steam Rail Coach in Service. *Ry. Gaz.*, vol. 40, no. 9, Feb. 29, 1924, pp. 277-279, 7 figs. Results of a demonstration carried out on system of Jersey Rys. & Tramways Co. on Feb. 20, 1924. Economies effected since its introduction.

#### RAILWAY OPERATION

**Fuel Economy.** Conservation of Fuel in Railway Operation, W. E. Symons. *Ry. & Locomotive Eng.*, vol. 37, no. 2, Feb. 1924, pp. 41-49, 5 figs. Comparison of statistical items of 30 steam railways; hours of time each day under way earning revenue; locomotive improvements.

**Point Operation and Control.** Point Operation at Marshalling Yards. *Ry. Gaz.*, vol. 40, no. 5, Feb. 1, 1924, pp. 137-143, 11 figs. Description of Arter electrical equipment installed at yards of Northern Railway of France, which insures rapid and economical shunting movements.

**Train Control.** Train Control Company Improves Air Apparatus. *Ry. Elec. Engr.*, vol. 15, no. 3, Mar. 1924, pp. 81-83, 3 figs. Description of functions of the different pieces of pneumatic apparatus in train control system of Indiana Equipment Corp., of Indianapolis,

Ind.; develops valves to give graduated reduction of brake pipe pressure.

**Train Operation with Automatic Control.** C. & O. Ry. *Ry. Rev.*, vol. 74, no. 10, Mar. 8, 1924, pp. 449-461, 25 figs. Describes automatic train control, and signal system, both operated by alternating current; signals are three-indication color-light automatic block signals of absolute-permissive type.

#### RAILWAY REPAIR SHOPS

**London Underground Railways.** The Acton Works of the Underground Railways. *Engineer*, vol. 137, no. 3555, Feb. 15, 1924, pp. 172-174, 8 figs. partly on p. 176. Details of central repair shop which will eventually serve for overhauling of rolling stock belonging to Metro. District, London Elec. & City and South and Central London railways. See also *Ry. Gaz.*, vol. 40, no. 7, Feb. 15, 1924, pp. 195-202, 18 figs.; and *Engineering*, vol. 117, nos. 3033 and 3034, Feb. 15 and 22, 1924, pp. 195-202, and 229-234 and 240, 53 figs. partly on p. 208 and supp. plate.

#### RAILWAY SIGNALING

**Automatic.** Automatic Signals for a Railroad Grade Crossing. *Ry. Age*, vol. 76, no. 15, Mar. 15, 1924, pp. 735-738, 3 figs. Satisfactory for thin traffic; home and distant signals arranged on "normal danger" plan.

**Development.** Development of Railway Signaling, K. E. Kellenberger. *Ry. Signaling*, vol. 17, no. 2, Feb. 1924, pp. 60-64, 5 figs. Discusses manual block and automatic block systems, interlocking, track circuit, recent developments in signaling, and automatic train control. Paper read before Springfield Engrs. Club.

**Interlocking.** Operating Features of Electric Interlocking. *Ry. Rev.*, vol. 74, no. 11, Mar. 15, 1924, pp. 510-515, 10 figs. Recent developments of this type of mechanism which introduce refinements of detail contributing to operating efficiency.

**Lock-and-Block Working.** The "Syx" Improved Electric Lock-and-Block System. *Ry. Gaz.*, vol. 40, no. 7, Feb. 15, 1924, pp. 203-204, 2 figs. Describes style L, type B apparatus.

#### RAILWAY TIES

**Comparison of Types.** Railway Sleepers, F. H. Clark. *Assn. Chinese & Am. Engrs.—J.*, vol. 4, no. 9, Nov. 1923, pp. 6-13. Present conditions in China; efforts made in other countries to secure better or less expensive supply of ties; how experience and research of other countries can be advantageously applied to conditions in China.

**Reinforced-Concrete.** The Utilization of Reinforced-Concrete Ties (Utilisation de traverses en béton de ciment armé), M. Adam. *Revue Générale des Chemins de Fer*, vol. 43, no. 2, Feb. 1924, pp. 105-113, 9 figs. Discusses their employment for reducing maintenance expenses of secondary lines; experiences of the Orléans Co. with concrete ties on 21-km. line section between Hautefort and Terrasson.

**Steel, Corrosion of.** The Causes of Premature Failure of Ribbed Ties (Ueber die Ursachen der vorzeitigen Zerstörung von Rippenschwellen), R. Kühnel and G. Marzahn. *Stahl u. Eisen*, vol. 44, no. 7, Feb. 14, 1924, pp. 175-178, 4 figs. Describes nature of damages occurring in railway ties; chemical investigation; investigation of mechanical properties and of structure; main cause of corrosion is attributed to poor design; protection of ties against corrosion.

#### RAILWAY TRACK

**Curves.** The Cubic Transition Railway Spiral, M. K. Rice-Oxley. *Instn. Civ. Engrs.—Sessional Notices*, no. 3, Feb. 1924, pp. 73-74. Author derives suitable curve and endeavors to show how it may be set out by rectangular offsets or by theodolite without use of tables or complicated formulas. (Abstract.)

**Economic Layout.** The Function of Steam Consumption and the Economic Layout of Railway Lines (Die Dampfverbrauchsfunktion und die wirtschaftliche Linienführung der Bahnen), W. G. Waffenschmidt. *Baugenieur*, vol. 6, no. 2, Jan. 31, 1924, pp. 23-27, 8 figs. Attempt is made to compare the economic efficiency of lines without use of virtual lengths.

**Grade Reduction vs. Heavier Power.** Grade Reduction or Heavier Power. *Ry. Rev.*, vol. 74, no. 11, Mar. 15, 1924, pp. 509-510. Appendix A, preliminary report of Committee on Economics of Railway Location, Am. Ry. Eng. Assn.

**Inspection Car.** Track Inspection on the Erie R. Ry. *Ry. Rev.*, vol. 74, no. 11, Mar. 15, 1924, pp. 502-508, 11 figs. Describes special car designed and built for better track inspection, by reconstructing a passenger car, and fitted with instruments which record all low joints, line and surface, gage and lurches; charts made by car are blueprinted and copies of their respective sections sent to track foremen to locate and correct defects recorded.

**Maintenance.** How the Illinois Central Uses Labor More Efficiently, G. M. O'Fourke. *Ry. Eng. & Maintenance*, vol. 20, no. 3, Mar. 1924, pp. 99-100. Detailed programs, concentration on specific tasks, and analysis of methods increase output; how section work was scheduled; another method of making time studies.

**Snow-Protecting Structures.** Snow-Protecting Structures for High Altitude Railways (Sneforygninger paa Højfjeldsbaner), G. R. Lorange. *Teknisk Ukeblad*, vol. 17, nos. 5 and 6, Feb. 1 and 8, 1924, pp. 45-47 and 56-59, 17 figs. Describes a number of wooden structures designed to keep snow off railway tracks in very effective ways.

**Track-Bolt Specifications.** Specifications for Quenched Carbon Steel and Alloy Steel Track Bolts. *Am. Ry. Eng. Assn.—Bul.*, vol. 25, no. 263, Jan. 1924, pp. 403-405. Specification covering materials, chemical and physical requirements, design and tolerance, manufacture, inspection, and marking.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**RAILWAY YARDS**

**Switching.** A Proposed Catapult Switching Yard, F. W. Bagelston. Eng. & Contracting (Railways), vol. 61, no. 2, Feb. 20, 1924, pp. 409-414, 4 figs. Economic necessity of some radical improvement in present methods of switching freight cars. Description of novel process and means devised by author.

**RAILWAYS**

**Committee Reports, A. R. E. A.** American Railway Engineering Association Meeting. Eng. News-Rec., vol. 92, no. 12, Mar. 20, 1924, pp. 481-483. Review of reports on economics and standards; rails and joints; track material and maintenance; bridges and trestles; water and fuel supply, stations and buildings. See also Abstracts of Committee Reports, pp. 491-493.

**Equipment Depreciation.** Depreciation of Railway Equipment, J. E. Muhlfeld. Ry. & Locomotive Eng., vol. 37, no. 2, Feb. 1924, pp. 41-49, 5 figs. Depreciation accounts; physical condition of composite properties such as locomotives and cars.

**Valuation.** Railroad Valuation, A Brief Survey, Wm. D. Pence. Eng. News-Rec., vol. 92, no. 10, Mar. 6, 1924, pp. 406-408. Outline sketch of origin and growth of valuation movement leading up to Federal Act, what has been achieved to date, and present-day prospects for useful outcome.

**Water Pick-Up Systems.** Water Troughs on the Great Western Railway. Ry. Gaz., vol. 40, no. 6, Feb. 8, 1924, pp. 168-172, 6 figs. Standard permanent way with cross-ties used; troughs shaped with intumed edges at top to reduce splashing when water is being taken up by locomotive.

**REFRATORIES**

**Conductivity and Specific Heat.** Conductivity and Specific Heat of Refractories at High Temperatures, M. D. Hersey and E. W. Butzler. U. S. Bur. Mines, Reports of Investigations, No. 2564, Jan. 1924, 7 pp. General statement of problem, with results on Georgia firebrick to 1700 deg. Fahr.

**Open-Hearth-Furnace Linings.** Compare Steel Refractories, E. C. Kreutzberg. Foundry, vol. 52, no. 5, Mar. 1, 1924, pp. 175-176. Suggestions for improving qualities, methods of construction and maintenance of open-hearth furnace linings; problems of electric-furnace materials. Abstract from discussion at meeting of Am. Ceramic Soc.

**Refuse Firebrick, New Use for.** New Use for Refuse Refractory Material, S. F. Walton. Iron Age, vol. 113, no. 11, Mar. 13, 1924, pp. 786-788, 4 figs. Old fireclay brickbats ground up with bond to form highly refractory mortar; cost reported low.

**Steel Works.** Refractory Materials for Steelworks Chem. Age (Lond.), vol. 10, no. 242, Feb. 2, 1924, pp. 10-12, 4 figs. Their uses and essential properties they should possess in order to insure satisfactory results.

**REFRIGERANTS**

**Ethyl Chloride.** The Thermal Properties of Ethyl Chloride, C. J. Jenkin and D. N. Shorthose. Refrig. Eng., vol. 10, no. 5, Feb. 1924, pp. 313-318, 3 figs. Results of research carried out at Eng. Lab. in Oxford for Eng. Committee of Food Investigation Board. From Special Report No. 14 of Dept. Sci. & Indus. Research of Great Britain.

**REFRIGERATING MACHINES**

**Absorption.** The Absorption Ice Machine, H. A. Cranford. Southern Eng., vol. 40, no. 6, and vol. 41, no. 1, Feb. and Mar. 1924, pp. 38-42 and 38-40, 9 figs. Pointers on purchasing; the various apparatus comprising the system; handling aqua-ammonia pump; packing, gaskets and supplies.

**Air.** The Use of Cold Air as a Refrigerating Agent, M. Leblanc. Refrig. Eng., vol. 10, no. 8, Feb. 1924, pp. 309-313, 3 figs. Application to freezing of ice; decided departure from beaten path described and advantages of such a system enumerated and backed up with figures. From Revue Générale du Froid, Dec. 1922.

**Ethyl-Chloride.** An Ethyl Chloride Refrigerating Compressor, R. G. Reid. Ice & Cold Storage, vol. 27, no. 311, Feb. 1924, pp. 27-30, 3 figs. The ideal refrigerant; pros and cons of ethyl chloride; describes Peter Brotherhood, Ltd., vertical single-cylinder two-stage unitflow machine.

**Modern Types.** Modern Refrigerating Machines, R. G. Reid. Inst. Mar. Engrs.—Trans., vol. 35, Feb. 1924, pp. 570-601 and (discussion) 601-607, 6 figs. Shows factors which have influenced adoption of high-speed compressor, describes some particular machines, and presents summary of tests taken from such machines on test bed in actual service.

**REFRIGERATION**

**Absorption System.** The Absorption Refrigerating System, H. J. Macintire. Power, vol. 59, no. 11, Mar. 11, 1924, pp. 399-401. Competition of compression system; refrigeration calculations; heat taken up in absorber.

**Intermittent System.** Intermittent System of Refrigeration, W. F. Schaphorst. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 347-348, 2 figs. Describes refrigerating system which may be operated on off-peak boiler loads.

**RESEARCH**

**Industrial.** Industrial Research as a Factor in Progress, A. W. Mellon. Chem. Age (N. Y.), vol. 32, no. 1, Jan. 1924, pp. 15-16. The role of industrial research in iron and steel, and by-product coke industry; cooperation of industry with organized research.

**Scientific Work and Research in the Mechanical Industry** (Ueber wissenschaftliche Arbeit und Forschung in der Maschinenindustrie), G. Lippart. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 5, Feb. 2, 1924, pp. 89-93. Discusses field of application of science in industry, and refers to conditions in United

States as described by W. Rosenhain; discusses research work in mechanical industry in Germany and suggests ways of improving work of coordination between science and industry.

**RIVETS**

**Cutting with Electric Arc.** Rivet Cutting with an Electric Arc. Ry. Rev., vol. 74, no. 7, Feb. 16, 1924, pp. 290-292, 6 figs. Describes equipment in use for burning off of rivets on steel cars and locomotive boilers and tender tanks at Huntington, W. Va., shops of Chesapeake & Ohio Ry.

**S****SCRAP**

**Chip-Handling Plant.** What Becomes of the Chips? C. J. Priebe. Am. Mach., vol. 60, no. 10, Mar. 6, 1924, pp. 361-363, 5 figs. Chip house at plant of LeBlond Machine Tool Co., Cincinnati; how chips are handled on production basis to facilitate shipment; plant for separating and filtering oil.

**SCREW THREADS**

**Stud Fitting.** Modern Practice in Fitting Studs. Am. Mach., vol. 60, no. 9, Feb. 28, 1924, pp. 323-324. Résumé of methods used in securing satisfactory fits for studs in aluminum, bronze, cast iron and steel.

**SEAPLANES**

**Static Stability.** Static Stability of Seaplane Floats and Hulls, W. S. Diehl. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 183, Mar. 1924, 13 pp., 3 figs. Lateral stability—twin floats; longitudinal stability—single and twin floats; lateral stability—single float and boat-type seaplanes; application to design.

**STANDARDIZATION**

**Methods.** Contribution to Methods of Standardization (Beschwingen über Normalisatie-methodiek), J. Goudriaan, Jr. Ingenieur, vol. 39, no. 3, Jan. 19, 1924, pp. 33-38, 6 figs. Theoretical investigation of most economical steps between successive sizes in series of standardized units. For practical reasons larger steps may be preferable.

**STANDARDS**

**German N. D. I. Reports.** Report of the German Industrial Standards Committee (Normenausschuss der Deutschen Industrie). Maschinenbau (NDI-Mitteilungen), vol. 24, no. 8, Jan. 24, 1924, pp. N43-N48, 1 fig. Proposed standard for tangential grooves; reports on transmission, standardization in boiler design, fits, cutting tools, screws, etc.

Report of the German Industrial Standards Committee (NDI-Mitteilungen). Maschinenbau, vol. 3, no. 9, Feb. 14, 1924, pp. 261-268, 5 figs. Proposed standard for rough and semi-finished hexagonal nuts. Changes in standard sheets. Reports of committees on testing methods, iron and steel, railway building materials, bar and section iron, plates and tubes, forged steel, and gears.

**STEAM**

**High-Pressure.** Properties and Utilization of High- and Maximum-Pressure Steam (Eigenschaften und Verwertung von Hoch- und Höchstdruckdampf), E. Josse. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 4, Jan. 26, 1924, pp. 65-71, 20 figs. Properties of steam; treatment of maximum-pressure steam in reciprocating engines (Borsig) and steam turbines (de Laval, Brown-Boveri & Cie, Erste Brünnler); feedwater heating through tapping steam; utilization of excess flue-gas heat.

**Maximum-Pressure.** The Technical and Economic Prospects of Maximum-Pressure Steam (Die technischen und wirtschaftlichen Aussichten von Höchstdruckdampf), F. Münzinger. Zeit. des Vereines deutscher Ingenieure, vol. 68, no. 7, Feb. 16, 1924, pp. 137-146, 16 figs. Calculation of heating surfaces of boiler, superheater and economizer; generation of maximum-pressure steam; behavior of maximum-pressure boilers in operation; dependence of boiler feedwater on steam pressure; new heat-economic problems.

**Volcanic, Utilization of.** The Utilization of Volcanic Steam in Italy. Nature (Lond.), vol. 113, no. 2828, Jan. 12, 1924, pp. 54-55, 3 figs. Efforts made in Italy to utilize natural steam which emerges from earth in volcanic districts for production of power.

**STEAM ENGINES**

**Heat Economy in.** Heat Economy in Reciprocating Steam Engines (Wärmewirtschaft in der Kolben-dampfmaschine), A. Christ. Praktischer Maschinen-Konstrukteur, vol. 57, no. 5, Feb. 5, 1924, pp. 31-33, 2 figs. Supplementary to first part of article published in no. 48-49, 1923, further tests and improvements are described.

**STEAM POWER PLANTS**

**Auxiliary Power Layouts.** Energy Supply for Station Auxiliaries, F. M. Billheimer. Elec. World, vol. 83, no. 8, Feb. 23, 1924, pp. 377-380, 10 figs. Reliable service under all operating conditions sought; effect of heat balance and bleeding on layouts; discussion of systems proposed and used.

**Detroit Lubricator Co.** Power Plant of the Detroit Lubricator Company, C. K. Little. Power, vol. 59, no. 9, Feb. 26, 1924, pp. 316-321, 6 figs. New plant has two bent-tube boilers of 2360 sq. ft. of heating surface each which are on second floor of building, with inside coal storage directly above stokers; details of cooling-water supply; cost of machinery.

**Montaup Elec. Co., Mass.** Cost Estimate of Montaup Plant Initial Development. Elec. World,

vol. 83, no. 10, Mar. 8, 1924, pp. 475-476, 1 fig. One 30,000-kw. unit and three 1500-hp., 400-lb. boilers giving temperature of 700 deg. Fahr., constitute first step.

**Salt-Manufacturing Plant.** Salt Manufacturer Installs 3625 Kw. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 317-322, 12 figs. New power plant of Ruggles & Rademaker for furnishing electricity, high and low pressure steam and compressed air; boilers are set singly; conveyor controls are interconnected.

**Steam Costs.** Comparative Analysis of Steam Costs, C. J. Mason. Nat. Engr., vol. 28, no. 3, Mar. 1924, pp. 108-109, 1 fig. How to determine whether privately generated or purchased steam is more economical.

**STEAM TURBINES**

**Lubrication.** Correct Lubrication for the Steam Turbine, C. C. Brown. Power Plant Eng., vol. 28, no. 6, Mar. 15, 1924, pp. 323-325. Operating methods, causes for breaking down of oil and specifications for suitable oils are discussed.

**Pressure and Velocity.** Relation of Pressure and Velocity in Various Types of Steam Turbines, F. P. Hodgkinson. Power, vol. 59, no. 12, Mar. 18, 1924, pp. 444-445, 3 figs. Describes variation in steam pressures and velocity for various types of turbine stages.

**STEEL**

**Chrome-Nickel.** See CHROME-NICKEL STEEL.

**Corrosion, Natural Water.** The Natural Water Corrosion of Steel in Contact with Copper, W. G. Whitman and R. P. Russell. Indus. & Eng. Chem., vol. 16, no. 3, Mar. 1924, pp. 276-279, 1 fig. Experiments wherein natural-water corrosion of steel in contact with metal lower in electromotive series has been quantitatively determined; emphasizes importance of these quantitative data in deciding as to mechanism of corrosion of steel from both theoretical and practical viewpoints.

**Grain Growth.** An Occurrence of Grain Growth in Steel, A. A. Blue. Iron Age, vol. 113, no. 10, Mar. 6, 1924, pp. 716-718, 9 figs. Carbonizing under certain conditions weakens steel; carbon shell causes internal pressure and weak ferrite bands.

**Tool.** See TOOL STEEL.

**STEEL CASTINGS**

**Carbon Vanadium.** Carbon and Carbon-Vanadium Steel Castings—A Comparison, J. M. Lessells. Am. Soc. Steel Treating—Trans., vol. 5, no. 2, Feb. 1924, pp. 144-152 and (discussion) 152-157, 7 figs. Physical properties of carbon and carbon-vanadium steel castings as obtained from coupon test pieces in cast, annealed and normalized conditions; evidence is given to show that addition of vanadium as alloying element greatly improves quality of material.

**STEEL, HEAT TREATMENT OF**

**Hardening, Selective.** A Shop Talk on Selective Hardening Methods. Can. Machy., vol. 31, no. 9, Feb. 28, 1924, pp. 23 and 36, 2 figs. Discusses methods available, viz., selective quenching, selective heating, and selective surface exposure.

**Nickel-Steel Carburization.** Heat-treatment of Steel with Special Reference to Production, J. W. Urquhart. Machy. (Lond.), vol. 23, no. 595, Feb. 21, 1924, pp. 681-684, 4 figs. Carburization of nickel steels.

**STEEL MANUFACTURE**

**Basic Steel, Metal-Mixer Practice for.** Metal Mixer Practice and Basic Steel Making, T. P. Colclough. Chem. Age (Lond.), vol. 10, no. 246, Mar. 1, 1924, pp. 18-19. Advantages derived from use of mixer. Used as preliminary refining furnaces, limestone, and oxide of iron, in form of iron ore or tap cinder, being charged as required, and in this way a large proportion of impurities is removed; effects of this purification of pig iron on operation of open-hearth furnaces.

**High-Quality Steel.** Fundamentals Essential to Improved Quality Steel Production, Em. Gathmann. Am. Soc. Steel Treating—Trans., vol. 5, no. 2, Feb. 1924, pp. 158-168, 4 figs. Fundamentals essential to high-quality steel production and certain improved ingot molds and appliances, whereby tonnage production of sound steel has been made possible and practicable; in author's belief, one of fundamentals is use of big-end-up or inverted pyramidal ingot, in combination with other fundamental practice as described in detail.

**Open-Hearth-Furnace.** Absorption of Sulfur from Producer Gas in Open-hearth Furnaces, J. H. Nead. Am. Inst. Min. & Met. Engrs.—Trans., No. 1298-S, Feb. 1924, 10 pp., 2 figs. Results obtained from two Arco ingot-iron heats; absorption occurs during melting-down stage.

**Rate of Cooling in Ingot Molds.** Effect on Steel of Variations in Rate of Cooling in Ingot Molds, W. J. Priestley. Am. Inst. Min. & Met. Engrs.—Trans., no. 1236-S, Feb. 1924, 56 pp., 49 figs. Shows, by practical experiments, how rate of cooling steel in mold governs ingotism, segregation, formation of dendrites and distribution of intergranular material, and resulting effect these conditions have on physical qualities of steel before annealing, after annealing, and after forging. How structure of steel is effected by design of mold and method of pouring.

**STEEL WORKS**

**Granite City, Ill.** Expanding from Kitchen Ware to Ingots, G. L. Lacher. Iron Age, vol. 113, no. 11, Mar. 13, 1924, pp. 773-778, 8 figs. Latest additions to Granite City Works of Nat. Enameling & Stamping Co. include plate mill, regenerative-type slab-heating furnace and large sheet plant.

- \* Roebeling's, John A. Sons Co.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

**Works, and Why.** Jos. G. Worker. *Coal Age*, vol. 25, no. 10, Mar. 6, 1924, pp. 347-349, 5 figs. Number of underfeed stokers has increased rapidly; what special features in design have been introduced for burning Western coals; progress of ash in fire must be given serious consideration. (Abstract.) Paper read before Chicago Section, A.S.M.E.

**Underfeed Stokers.** J. G. Worker. *Refrig. Eng.*, vol. 10, no. 8, Feb. 1924, pp. 295-304 and (discussion) 304-305 and 309, 21 figs. Description of some types (both multiple- and single-retort) now being used in United States; performance and coal conditions; height to set boilers.

#### STREET RAILWAYS

**Carhouses.** Carhouse for 100 Cars at Louisville, E. H. Miller. *Elec. Ry. J.*, vol. 63, no. 11, Mar. 15, 1924, pp. 403-406, 10 figs. Describes new structure, which replaces carhouse burned last year, of reinforced concrete with full sprinkler equipment; through tracks facilitate car movement; novel type of double skeleton pits and facilities for car washing.

**Cars.** Brooklyn's "Duplex Car." Placed in Service. *Elec. Ry. J.*, vol. 63, no. 7, Feb. 16, 1924, pp. 252-255, 8 figs. Two-unit, three-truck car, 63 ft. 10 in. overall, built by Brooklyn-Manhattan Transit Corp.; has novel center construction with weather-tight drum to permit free passage between the two sections.

**One-Man Cars in Holland.** P. M. Nieuwenhuis. *Elec. Ry. & Tramway J.*, vol. 50, no. 1223, Feb. 8, 1924, pp. 71-74, 3 figs. Experiences and results at Arnhem.

**Three-Car Articulated Train.** Three-Car Articulated Train for Detroit, A. C. Colby. *Elec. Ry. J.*, vol. 63, no. 10, Mar. 8, 1924, pp. 357-362, 12 figs. Articulated construction reduces weight and cost and also gives improved riding qualities; seating capacity is 140 passengers; many unusual features of design.

**Track Reconstruction.** Reconstructing Track For \$7.72 Per Lineal Foot. *Elec. Traction*, vol. 20, no. 2, Feb. 1924, pp. 85-87, 6 figs. How Oklahoma Ry. Co. reconstructed 3500 ft. of double track at low cost; modern methods employed.

#### SUPERPOWER

**Isolated Station vs. Superpower vs. Coal Conservation.** E. Douglas. *Power*, vol. 50, no. 12, Mar. 18, 1924, pp. 448-449. Points out that panacea of all troubles does not lie with superpower, nor will isolated plant be best solution in all cases, but a combination of the two with proper consideration given to both power and heating, as well as use of steam for industrial purposes, will be intelligent solution. (Abstract.) Paper read before Wis. Eng. Soc.

**Significance of.** Super Power. S. O. Hayes. *Indus. Mgt. (N. Y.)*, vol. 67, no. 3, Mar. 1924, pp. 136-138. What it means and what it will accomplish.

## T

#### TERMINALS, LOCOMOTIVE

**Peach Creek, W. Va.** New Engine Terminal at Peach Creek, W. Va. *Ry. Rev.*, vol. 74, no. 7, Feb. 16, 1924, pp. 279-286, 15 figs. partly on p. 287. Describes engine house, boiler plant and engine room, machine shop, oil room, store-department facilities, coaling plant, and water-supply plant and its equipment.

**Richmond, Va.** Advanced Design in New Engine Terminal. *Ry. Age*, vol. 76, no. 9, Mar. 1, 1924, pp. 492-499, 17 figs. Layout, outside facilities and buildings of terminal recently completed at Richmond, Va. by R. F. & P. See also *Ry. Rev.*, vol. 74, no. 10, Mar. 8, 1924, pp. 399-412, 32 figs.

#### TERMINALS, RAILWAY

**Passenger.** Progress on the Chicago Union Station. *Ry. Rev.*, vol. 74, no. 10, Mar. 8, 1924, pp. 416-422, 10 figs. Description of important passenger tunnel; will be in service late in 1924 and will be completed in 1925.

**Ports.** Study of a Large Terminal Develops Basic Data. J. R. Bibbins. *Ry. Age*, vol. 76, no. 8, Feb. 23, 1924, pp. 463-465, 2 figs. Origin-destination survey made at New Orleans may be applied to other large railway centers.

**Train Shed, Cologne, Germany.** The Train Shed of the Cologne-Deutz Railway Station (Die Bahnhofshalle von Köln-Deutz), M. Foerster. *Bauingenieur*, vol. 5, no. 3, Feb. 15, 1924, pp. 43-55, 26 figs. Three-sectional shed has middle span of 27.50 m. and side spans of 18.72 m. each; whole system is statically determined and consists of three 3-hinged arches.

#### TESTS AND TESTING

**Shop Methods.** Test Methods for the Shop. D. A. Hampson. *Am. Mach.*, vol. 60, no. 9, Feb. 28, 1924, pp. 325-328, 7 figs. Usual shop tests; use of revolution counter, spring balance, platform scale and Bourdon gage; checking instruments.

#### TEXTILE MILLS

**Electric Drive.** Electricity in Textile Mills. *Electrician*, vol. 92, no. 2389, Feb. 29, 1924, pp. 252-260, 17 figs. Six articles, discussing advantages of electric drive for textile mills, use of electricity for driving flax spinning mills, selecting motors for cotton mills, replacing steam with electric drive without cessation of production in carpet mill, special points in converting equipment to electric drive in fabric-printing works, and a Swiss spinning mill fitted with Oerlikon drives.

#### TIRES, RUBBER

**Molds and Forms for.** How Automobile Tire

Molds Are Made, Chas. O. Herb. *Machy. (N. Y.)*, vol. 30, no. 7, Mar. 1924, pp. 497-500, 9 figs. Turning and boring mold and form, and engraving tread design in mold.

#### TOOL STEEL

**Time and Temperature, Effects of.** The Effects of Time and Temperature on Certain Special Steels. W. E. Woodward. *West of Scotland Iron & Steel Inst.—Jl.*, vol. 31, part 2, Nov., Session 1923-24, pp. 32-34 and (discussion) 35-39, 23 figs. on supp. plates. Describes work undertaken to see if some modern steels said to be suitable for high-speed steel tools would exhibit some phenomena which might afford clue as to their reputed properties; use of Landon dilatometer for measuring expansion and contraction of moderately sized specimens.

#### TOOLS

**Cutter Heads.** A New Cutter Head for Locomotive Shops (Ein neuer Messerkopf für Lokomotiv-Werkstätten), Trautvetter. *Glaser's Annalen*, vol. 94, no. 2, Jan. 15, 1924, pp. 21-23, 5 figs. Describes new Triplex cutter block for drilling holes in smoke and water tubes.

**Flexible Shaft Driven.** Power Tools with Flexible-Shaft Drive (Kraftwerkzeuge mit Drahtwellenantrieb), W. Schwarz. *Maschinenbau*, vol. 3, no. 9, Feb. 14, 1924, pp. 237-240, 9 figs. Points out advantages of power transmission by means of a flexible wire shaft.

**Pattern Work and Drafting.** Tool Engineering. A. A. Dowd. *Am. Mach.*, vol. 60, nos. 11 and 12, Mar. 13 and 20, 1924, pp. 407-409 and 443-445, 8 figs. Mar. 13: Points on pattern work for tool designer; use of cores and loose pieces; importance of fillets. Mar. 20: Organization of tool-drafting department; method of keeping record of drawings.

**Stellite.** Recent Results Obtained with Stellite Tools (Neue Ergebnisse mit Stellitewerkzeugen), H. Markle. *Maschinenbau*, vol. 3, no. 9, Feb. 14, 1924, pp. 235-237. Favorable results of recent tests.

#### TRACTORS

**Farm, Specifications for.** British and American Agricultural Tractor Specifications. *Automotive Industries*, vol. 50, no. 8, Feb. 21, 1924, pp. 453-457. Tabular data.

#### TUBES

**Heat Dissipation from Surfaces.** Heat Dissipation from the Surfaces of Pipes and Cylinders in an Air Current, A. H. Gibson. *Lond., Edinburgh, & Dublin Philosophical Mag. & J. Sci.*, vol. 47, no. 278, Feb. 1924, pp. 324-336, 4 figs. Experiments carried out with view of obtaining data as to rate of heat dissipation from tubular metal surfaces adaptable as oil coolers for aircraft.

**Secondary Failure.** On the Secondary Failure of Thin Tubes of Circular Section subjected to Terminal Couples, M. S. Ahmed. *Lond., Edinburgh, & Dublin Philosophical Mag. & J. Sci.*, vol. 47, no. 278, Feb. 1924, pp. 319-323, 3 figs. Investigation to determine under what conditions secondary stresses due to deformation of cross-section into oval shape exceed primary stresses found on ordinary theory of pure bending.

## V

#### VALVE GEARS

**Transmission Effects.** Transmission Effects of a Multiple-Link Valve Gear (Übersetzungswirkungen eines mehrgliedrigen Getriebes), R. Doerfl. *Maschinenbau*, vol. 3, no. 8, Jan. 24, 1924, pp. 193-197, 9 figs. Investigation of admission valve gear of uniflow engine and determination of dimensions of valve-gear rods.

#### VALVES

**Superheated-Steam and High-Pressure.** Modern Superheated-Steam and High-Pressure Valves (Neuere Heissdampf- und Hochdruckschieber), G. W. Koehler. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 5, Feb. 2, 1924, pp. 95-100, 22 figs. Deals with valves with simple and with two parallel seats and emphasizes advantage of auxiliary valve, which is automatically set in action by tightening of valve stem; deals also with flap valves, and their advantages.

#### VIBRATIONS

**Machinery, Isolation of.** The Isolation of Machinery Vibration and Noise. *Machy. Market*, no. 1214, Feb. 8, 1924, pp. 23-24, 2 figs. Describes effect of patent anti-vibration devices and "Coresil" foundation plates.

**Mechanical.** The Vibration Problem in Engineering. R. Soderberg. *Elec. J.*, vol. 21, nos. 1, 2 and 3, Jan., Feb. and Mar., 1924, pp. 39-43, 53-55 and 89-97, 21 figs. Fundamental facts underlying problem of vibration, its general effects and methods usually employed in preventing and curing vibration troubles; review of theory; mechanical balancing.

## W

#### WATER POWER

**Economic Utilization, Switzerland.** The Consumption of Energy from Hydroelectric Plants in Switzerland and the Utilization of Water-Power Sources (Ueber die Verhältnisse des Energieabsatzes

aus den hydroelektrischen Werken in der Schweiz, etc.), W. Wyssling. *Schweiz. Elektrotechnischer Verein—Bul.*, vol. 15, no. 1, Jan. 1924, pp. 1-28, 8 figs. Discusses characteristics of Swiss water powers and investigates variations in power demand according to hour and season, showing by numerous figures and diagrams to what extent it is possible to influence this variation and thus improve possibilities of power utilization; discusses export of surplus energy, and draws conclusions for design of hydroelectric plants.

#### WATER TREATMENT

**Softening.** Water-Softening by Means of Doucil, T. P. Hilditch and H. J. Wheaton. *Engineering*, vol. 117, no. 3035, Feb. 29, 1924, pp. 287-288. Describes comparatively new base-exchange material manufactured under name of doucil. Paper read before joint meeting of Instn. Mech. Engrs. and Soc. Chem. Industry.

**Water Purification for Industrial Purposes.** J. P. O'Callaghan. *Engineering*, vol. 117, no. 3035, Feb. 29, 1924, pp. 286-287. Sedimentation and filtration of water; softening by lime-soda process, and by permutit-zeolite process. Paper read before joint meeting of Instn. Mech. Engrs. and Soc. Chem. Industry.

#### WELDING

**Cast Iron.** See CAST IRON, WELDING.

**Chemical Aspects.** Some Chemical Aspects of Welding, J. R. Boor. *Engineering*, vol. 117, no. 3033, Feb. 15, 1925, pp. 221-223, 2 figs. Theory and practice in ferrous and non-ferrous work; problems in oxidation and reduction. Paper read before Instn. Welding Engrs. See also *Chem. Trade J. & Chem. Engr.*, vol. 74, no. 1917, Feb. 15, 1924, pp. 189-191; and *Chem. Age (Lond.)*, vol. 10, no. 244, Feb. 16, 1924, pp. 164-165.

**Electric.** See ELECTRIC WELDING; ELECTRIC WELDING, ARC.

**Oxy-Acetylene.** See OXY-ACETYLENE WELDING.

#### WELDS

**Welded Joint Testing.** A Cheap, Reliable and Exhaustive Method of Testing Welded Joints, A. Menetrier. *Am. Welding Soc.—Jl.*, vol. 3, no. 1, Jan. 1924, pp. 13-17, 6 figs. Results of series of shock bending tests which have proved of great value for investigation of relative strength of mild steel-welded joints performed with three different types of electrodes.

#### WIND

**Conditions, Study of.** Study of Wind Conditions (Die Erforschung der Windverhältnisse), M. Rosenmüller. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 8, Feb. 23, 1924, pp. 177-179, 5 figs. Study of constancy of wind based on meteorological data; suggestions for seeking good exposures; choice of favorable site for erection of wind motor and the requisite measuring instruments.

**German Statistics.** Critical Notes on Wind Statistics in Germany and the Study of Weather from a Technical Standpoint (Kritische Bemerkungen zur Windstatistik in Deutschland und zur Kenntnis vom Wetter bei Technikern), C. Kassner. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 8, Feb. 23, 1924, pp. 179-180. Deals with numerous relations between meteorology and technology and points out that weather statistics should not be employed without some knowledge of meteorology.

#### WIND MOTORS

**Design.** Wind Power (Windkraft), P. v. d. Sterr. *Zeit. des Vereines deutscher Ingenieure*, vol. 68, no. 5, Feb. 2, 1924, pp. 106-108, 7 figs. Method is suggested of calculating coefficient of variability; attention is called to fact that efficiency of most important parts of wind-motor installation plays an entirely different role than is otherwise the case, and other types of machinery are required.

#### WIND TUNNELS

**Toronto, Canada.** Aeronautical Research. *Can. Engr.*, vol. 46, no. 8, Feb. 19, 1924, pp. 255-256, 2 figs. Describes wind channel opened in Aerodynamics Laboratory, Univ. of Toronto, for testing airplane models; first plant in Canada.

#### WINDMILLS

**Burne System.** Wind-driven Electrical and Other Installations. *Engineer*, vol. 137, no. 3560, Mar. 21, 1924, p. 318, 2 figs. Describes new type of windmill which is radical departure from wind-wheel type; chief improvements are found in governing system and construction of sails; designed by E. L. Burne.

#### WIRE ROPE

**Testing.** Testing Wires and Wire Ropes, R. G. Batson. *Testing*, vol. 1, no. 1, Jan. 1924, pp. 7-22, 6 figs. Notes on fatigue testing and fatigue tests on stranded cables, results are given in tabular form.

#### WOOD

**Testing Machine for.** A Universal Static and Kinetic Wood Testing Machine, Developed to Meet the Requirements of the French Aeronautical Standardization Committee, B. C. Anderson. *Testing*, vol. 1, no. 1, Jan. 1924, pp. 72-79, 7 figs. New machine is used first for static tests of wood in bending, in compression, in tension, by splitting and for hardness, and secondly, for carrying out kinetic tests in transverse shock application.

#### WOODWORKING MACHINES

**Mortising and Boring Machines.** Wood-Working Mortising and Boring Machine. *Engineering*, vol. 117, no. 3035, Feb. 29, 1924, pp. 268-269, 3 figs. Describes combined chain and hollow-chisel machine for mortising which can also be used for boring, made by Wadkin & Co., Leicester, England.

Catalogue data of firms marked \* appear in the A.S.M.E. Condensed Catalogues of Mechanical Equipment, 1923-24 Volume

# THE ENGINEERING INDEX

(Registered United States, Great Britain and Canada)

**THE ENGINEERING INDEX** presents each month, in conveniently classified form, items descriptive of the articles appearing in the current issues of the world's engineering and scientific press of particular interest to mechanical engineers. At the end of the year the monthly installments are combined along with items dealing with civil, electrical, mining and other branches of engineering, and published in book form, this annual volume having regularly appeared since 1906. In the preparation of the Index by the engineering staff of The American Society of Mechanical Engineers some 1200 technical publications received by the Engineering Societies Library (New York) are regularly reviewed, thus bringing the great resources of that library to the entire engineering profession.

Photoprint copies (white printing on a black background) of any of the articles listed in the Index may be obtained at a price of 25 cents a page. When ordering photoprints identify the article by quoting from the Index item: (1) Title of article; (2) Name of periodical in which it appeared; (3) Volume, number, and date of publication of periodical; (4) Page numbers. A remittance of 25 cents a page should accompany the order. Orders should be sent to the Engineering Societies Library, 29 West 39th Street, New York.

(See also page 374 of this issue for supplementary items.)

## ABRASIVES

**Industrial Diamonds.** How Industrial Diamonds Are Set, F. B. Wade. Abrasive Industry, vol. 5, no. 4, Apr. 1924, pp. 93-94. Properties of diamonds for wheel truing, and setting methods.

## AIR COMPRESSORS

**Impurities in Intake.** Keeping Solid Impurities Out of the Air-Compressor Intake, Wm. V. Fitzgerald. Power, vol. 59, no. 16, Apr. 15, 1924, pp. 599-600, 1 fig. Points out that in analyzing troubles in air-compressor operation, single cause for all is frequently found, namely, impurities in intake air.

**Piston.** Chart for Graphic Determination of Main Dimensions and Data of Piston Compressors (Rechen-tafel zur graphischen Ermittlung der Hauptabmessungen und -daten von Kolbenkompressoren), H. Heinssen. Maschinenbau, vol. 3, no. 11, Mar. 13, 1924, pp. 364-366, 1 fig. Chart for graphic determination of piston strokes and average piston speeds of piston compressors with given suction performance, r.p.m., and cylinder conditions (relation of cylinder diam. to piston stroke).

**Semi-Portable.** Semi-Portable Air Compressing and Pumping Sets. Engineering, vol. 117, no. 3040, Apr. 4, 1924, pp. 432-433, 6 figs. Describes self-contained air-compressing unit supplied by Parsons Co., with standard Parsons 3-cylinder engine; and single-cylinder paraffin engine for driving centrifugal pump, whole forming semi-portable pumping unit.

## AIR CONDITIONING

**Theaters.** Downward-Diffusion Air Conditioning System for a Large Theater. Heat & Vent. Mag., vol. 21, no. 3, Mar. 1924, pp. 57-58, 16 figs. partly on pp. 64-65. How Grauman's Metropolitan Theater, Los Angeles, Cal., is heated, humidified and ventilated in winter and cooled in summer.

## AIRCRAFT CONSTRUCTION MATERIALS

**Fabrics.** Testing Airplane Fabrics, A. Pröhl. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 186, Apr. 1924, 33 pp., 8 figs. Air pressure and tensions in fabric; requirements for fabric; determination of initial tension; interpretation of experiments with stretching frame; curves facilitating calculation of tensions and initial tensions; application of experiments on frames to investigation of wings; calculation for dropped-ball test. Translated from Technische Berichte, vol. 3, no. 7.

## AIRPLANE ENGINES

**Compression Ignition.** The Influence of Inlet Air Temperature and Jacket Water Temperature on Initiating Combustion in a High Speed Compression Ignition Engine, R. Matthews and A. W. Gardiner. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 185, Mar. 1924, 12 pp., 7 figs. Deals with some tests to determine influence on initiating combustion in one-cylinder compression ignition engine of (1) inlet air temperature, and (2) jacket water temperature.

**Developments and Tendencies.** The Airplane Engine: Actual Achievements and Tendencies (Le moteur d'aviation: résultats acquis et tendances actuelles), G. Lehr. Aéronautique (Aerotechnique), vol. 6, no. 56, Jan. 1924, pp. 3-10, 13 figs. Problems involved in improvement of design.

**Existing, for Commercial Airplanes.** The Use of Existing Engines on Commercial Planes (L'utilisation des Moteurs d'Aviation existant sur les appareils civils). Aérophile, vol. 31, no. 23-24, Dec. 1-15,

1923, pp. 361-365, 4 figs. It is shown that by reducing torque, i.e., mean effective pressure, 10 per cent, life of engine is doubled; it is therefore concluded that existing military engines could be used with profit in commercial planes, provided they are not driven to maximum speeds and torques of which they may be capable. See also abstract in Génie Civil, vol. 84, no. 5, Feb. 2, 1924, p. 119.

**Rolls-Royce Condor III.** The Rolls-Royce Condor III Aero Engine, W. H. Sayers. Aeroplane, vol. 26, no. 11, Mar. 12, 1924, pp. 222, 224, 226 and 228-229, 12 figs. Description of a 12-cylinder engine developing a normal b.h.p. of 650 at 1900 r.p.m.

**Salmson.** Salmson Aviation Engines (Les Moteurs d'aviation Salmson). Aérophile, vol. 32, no. 1-2, Jan. 1-15, 1924, pp. 33-34, 2 figs. Describes different types of air- and water-cooled engines constructed by firm of Salmson.

**Storage Preparations.** Comparison Tests of Storage Preparations for Aviation Engine Storage of Less than Six Months, S. A. Christiansen. Air Service Information Circular, vol. 5, no. 451, Mar. 1, 1924, 9 pp., 15 figs. Test to investigate methods and make recommendations.

## AIRPLANE PROPELLERS

**Adaptability to Airplanes.** A Graphic Method for Determining Adaptability of Propellers to Airplanes (Méthode graphique pour l'adaptation des hélices aux avions), G. Delanghe. Génie Civil, vol. 84, no. 8, Feb. 23, 1924, pp. 185-187, 1 fig. Discusses elements of propellers, and develops method for determining, under given conditions, propeller with which maximum speed can be obtained with given course and altitude.

**Slipstream Obstructions.** The Effect of Slipstream Obstructions on Air Propellers, E. P. Lesley and B. M. Woods. Nat. Advisory Committee for Aeronautics—Report, no. 177, 1924, 24 pp., 15 figs. Results of investigation show that combined efficiency of propeller with any obstruction in slipstream is less than that of propeller free and unobstructed.

## AIRPLANES

**Airfoils.** Aerodynamic Characteristics of Airfoils. Nat. Advisory Committee for Aeronautics—Report, no. 182, 1924, pp. 145-186, 132 figs. Continuation of reports on airfoil data.

**Design.** The Construction of Airplanes in France and other Countries (La construction des avions en France et à l'étranger), P. Grimaud. Aéronautique, vol. 5, no. 55, Dec. 1923, pp. 509-516, 11 figs. Policy in France, Great Britain, United States and Germany; commercial planes; high-speed planes; military monoplanes and biplanes; medium and large planes.

**Flexible Wings.** Study of Bird Wings and Flexible Planes (Sur l'étude aérodynamique des ailes d'oiseaux, et des voilures souples), E. Huguenard, A. Magnan and A. Planiol. Académie des Sciences—Comptes Rendus, vol. 178, no. 2, Jan. 7, 1924, pp. 193-196, 2 figs. Describes experimental arrangement used to measure lift-draft ratio, etc., of supple wings. See abstract in Génie Civil, vol. 84, no. 4, Jan. 26, 1924, pp. 91-92, 2 figs.

**Fokker.** The Fokker C4 Commercial Airplane. Aviation, vol. 16, no. 12, Mar. 24, 1924, p. 310, 1 fig. Adaptation of 2-seater corps observation plane; equipped with 400-hp. Liberty engine.

**Glider.** A New Type of Glider (Ein neuartiges "Segel"-Flugzeug), R. Platz. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 15, no. 1-2, Jan. 26, 1924, pp. 1-2, 5 figs. Also (translation) Flight, vol. 16, no. 10, Mar. 6, 1924, pp. 129-130, 4 figs. Describes de-

sign developed by author, which combines advantages of low cost of production, collapsibility so that it can be carried in railway passenger car, easy and cheap changeability of parts, and light weight so that it can be carried by one man, and can be put together in 10 min.; results of tests with models and with full-size plane.

**High-Speed, Development of.** The Development of High-Speed Aircraft, R. Mayo. Roy. Aeronautical Soc.—Jl., vol. 28, no. 159, Mar. 1924, pp. 158-182 and (discussion) 183-188, 9 figs. Early development; Gnome engines; French ascendancy and British awakening; British research period; war period; revival of rotary engine; postwar period; beginning of American supremacy; French and British post-war efforts; high-speed seaplanes and flying boats; future prospects; value of speed races.

**Light.** Tendencies of Light-Airplane Construction (Richtlinien des Leichtmaschinenbaus), A. Baumann. Zeit. für Flugtechnik u. Motorluftschiffahrt, vol. 15, no. 3-4, Feb. 26, 1924, pp. 17-19. Discusses factors and problems underlying development of light planes. See also articles entitled The Nature of Light-Airplane Construction (Das Wesen des Leichtbaues), Geo. König, p. 20; and Light-Airplane Construction and Its Future Development (Der Leichtbau und seine Fortentwicklung), H. Seehase, pp. 20-22, 7 figs.

**Lioré-Olivier.** The New Lioré-Olivier Airplanes and Hydroplanes (Les nouveaux Avions et Hydravions Lioré-Olivier). Aérophile, vol. 32, no. 1-2, Jan. 1-15, 1924, pp. 35-37, 3 figs. Details of 3-seater bomber, 2-seater pursuit and night-observation plane, and commercial and military hydroplanes.

**Longitudinal Oscillation.** Longitudinal Oscillation of an Airplane, R. Fuchs and L. Hopf. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 188, Apr. 1924, 45 pp., 10 figs. Problem and method of analysis of longitudinal oscillation. Translated from Technische Berichte, vol. 3, no. 7.

**Rolling Moment Due to Ailerons.** The Induction Factor Used for Computing the Rolling Moment Due to the Ailerons, M. M. Munk. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 187, Apr. 1924, 5 pp., 1 fig. Induction factor is determined from result of model test, and compared with formula recently developed by author; the two results are found to be in substantial agreement.

**P. 5.** The "P. 5" or Phoenix "Cork" Flying Boat. Flight, vol. 16, no. 11, Mar. 13, 1924, pp. 144-150, 16 figs. Complete description of P. 5 flying boat, having two 360-hp. Rolls-Royce Eagle engines and following dimensions: length 49 ft. 1 1/4 in., span 85 ft. 6 in., ailerons 81 sq. ft., and notes on some other products of English Elec. Co., Ltd.

**Seaplanes.** See SEAPLANES.

**Vulture.** The Vickers "Vulture" Amphibian Flight, vol. 16, no. 13, Mar. 27, 1924, pp. 172-175, 9 figs. Particulars of flying boat with a Napier "Lion" 450-hp. engine; length 38 ft. 2 in., span 49 ft.; top speed with full load and at sea level about 104 m.p.h., cruising speed about 82 m.p.h.

## AIRSHIPS

**Semi-Rigid.** The Italian "N" Type Semi-Rigid Airship. Flight, vol. 16, no. 12, Mar. 20, 1924, pp. 160-161, 3 figs. Fitted with three 250-hp. engines each located in a stream-lined nacelle built up of duralumin and communicating with interior of keel; capacity 670,700 cu. ft., length 347 ft. 8 in., maximum height 85 ft. 3 in., maximum diameter 64 ft., useful load 10.5 tons, maximum speed 62 m.p.h.

 \* New Departure Mfg. Co.

**Bearings, Roller**  
 \* Gwilliam Co.  
 \* Hyatt Roller Bearing Co.  
 \* Norma Co. of America  
 \* Royersford Fdry. & Mach. Co.  
 \* Timken Roller Bearing Co.

**Bearings, Self-Oiling**

\* Brown, A. & F. Co.  
 \* Doehler Die-Casting Co.  
 \* Falls Clutch & Machinery Co.  
 \* Hill Clutch Machine & Fdry. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Royersford Fdry. & Mach. Co.  
 \* Wood's, T. B. Sons Co.

**Bearings, Tapered**  
 \* Timken Roller Bearing Co.

**Bearings, Thrust**  
 \* Fafnir Bearing Co.  
 \* General Electric Co.  
 \* Gwilliam Co.  
 \* Hill Clutch Machine & Fdry. Co.  
 \* Norma Co. of America  
 \* S K F Industries (Inc.)  
 \* Timken Roller Bearing Co.  
 \* Strom Ball Bearing Mfg. Co.

**Belt Dressing**  
 \* Dixon, Joseph Crucible Co.  
 \* Gandy Belting Co.

**Belt Lacing, Steel**  
 \* Bristol Co.

**Belt Tighteners**  
 \* Brown, A. & F. Co.  
 \* Hill Clutch Machine & Fdry. Co.  
 \* Jones, W. A. Fdry. & Mach. Co.  
 \* Link-Belt Co.  
 \* Medart Co.  
 \* Smidth, F. L. & Co.  
 \* Wood's, T. B. Sons Co.

**Belting, Canvas (Stitched)**  
 \* Gandy Belting Co.  
 \* United States Rubber Co.

**Belting, Conveyor**  
 \* Gandy Belting Co.  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.

**Belting, Elevator**  
 \* Gandy Belting Co.  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.

**Belting, Endless**  
 \* Gandy Belting Co.

**Belting Fabric**  
 \* Gandy Belting Co.

**Belting, Leather**  
 \* American Sole & Belting Leather Tanners (Inc.)

**Belting, Rubber**  
 \* Goodrich, B. F. Rubber Co.  
 \* United States Rubber Co.

**Belting, Waterproof**  
 \* Gandy Belting Co.

**Bending & Straightening Machines**  
 \* Long & Allstatter Co.

**Bends, Pipe**  
 \* Frick Co. (Inc.)  
 \* Vogt, Henry Machine Co.

**Billets, Steel**  
 \* Timken Roller Bearing Co.

**Blocks, Tackle**  
 \* Clyde Iron Works Sales Co.  
 \* Roebbling's, John A. Sons Co.

**Blowers, Centrifugal**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Coppus Engineering Corp'n  
 \* De Laval Steam Turbine Co.  
 \* General Electric Co.  
 \* Ingersoll-Rand Co.  
 \* Kerr Turbine Co.  
 \* Sturtevant, B. F. Co.  
 \* Westinghouse Electric & Mfg. Co.

**Blowers, Fan**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Coppus Engineering Corp'n  
 \* Greek Fuel Economizer Co.  
 \* Sturtevant, B. F. Co.

**Blowers, Forge**  
 \* American Blower Co.  
 \* Sturtevant, B. F. Co.

**Blowers, Pressure**  
 \* American Blower Co.  
 \* Clamage Fan Co.  
 \* Lammert & Mann Co.  
 \* Sturtevant, B. F. Co.

**Blowers, Rotary**  
 \* Fletcher Works  
 \* Lammert & Mann Co.  
 \* Schutte & Koerting Co.  
 \* Sturtevant, B. F. Co.

**Blowers, Soot**

\* Diamond Power Specialty Corp'n  
 \* Sturtevant, B. F. Co.

**Blowers, Steam Jet**  
 \* Schutte & Koerting Co.

**Blowers, Turbine**  
 \* Coppus Engineering Corp'n  
 \* Sturtevant, B. F. Co.
